"First of all," goes a typical drill, "be convinced of the value of the thing you have chosen to represent; be proud of it; be willing to have it known anywhere that you and it are related. How can you sell to others if you are not 'sold' yourself? Try every possible customer. The outside of a house is no criterion of the chances for a sale. Approach each house with the confidence of an invited guest. Go to the front door. The back door is all right under one condition—if you fail to get a response at the front.

"There is a right way and a wrong way of attacking a door. Press the button firmly. If there is no response, press it again, still more firmly. If you hear no footsteps, knock cheerily and loudly, for the bell may be out of order.

"Go about your work pleasantly, and confidently. In the home, always make friends with the children. If the husband is at home, cut your canvass short. He will like your implication that he can recognize value."

Among the prophets of the revival of doorstep selling is Paul W. Ivey, formerly of the faculty of the University of Michigan and now professor of marketing in the University of Nebraska. Dr. Ivey is on leave of absence while engaged in giving salesmanship lectures in various large cities. In these lectures he has something definite for the house-to-house man on this subject of getting into the house.

When a student in the University of Michigan, Dr. Ivey did canvassing during several summers, selling a line of aluminum kitchen utensils. "Getting in" troubled him at first. He tells about it.

"Ever notice," Dr. Ivey asks, "that screen doors always open outward? Suppose you stand directly in front of the screen door when you ring. Well, the maid or the lady of the house can't very well open it if you're in the way, can she? When she appears, stand to one side, not the hinge side, with a slight inclination of body as if you are making way for her to open the door as she would open it for anyone being welcomed to the house. It will open.

"How easily we all are led, and how easily we can lead people by suggestion! Study suggestion; it will pay big dividends."

There is more in doorstep selling than the money to be earned by it. As the masters of the drill say to students:

"Besides the money, you will get a training in self-confidence, in self-reliance, in persuasive speaking, in understanding of how to deal with men and women, of how the other nine-tenths live and think, that may be worth more to you than your entire academic course."

This man wants to buy the housewife's dollars.

Why Machine Has Made Voters Helpless

Successful Breaking-up of Party Organization Difficult Task Because of Misconceptions of People as to "Strength" of Present System

By AARON HARDY ULM

This is the second article. A third will appear in an early issue.

YOU, let us say, are just a citizen who would like to do a mere voter's part in helping run the government. As far as the Federal Government is concerned, it is in choosing a President that you can exercise greatest power. Why this is so is an interesting story in itself. Its telling must be deferred; but for the present we'll accept as a fact that in no other direction can the average voter in these United States express himself so pointedly as within those channels which lead to the Chief Magistracy.

There the voter faces rather singular obstacles, both actual and potential. You favor, we'll say, some particular person for President of the United States. What can you, just an ordinary voter, do toward actualizing that choice?

Of course you can "talk for" it, which helps. But even though there are many who think as you do, it takes a great deal more than talk to bring about even a general consideration of your choice. Vast and complicated detail must be attended to and mastered before you may have so much as a chance of voting for that choice.

Because of that, your choice, even in the beginning, isn't apt to be your real or "first" one; that is to say, the choice you would make if the selection of a President were left wholly to you. If it were left to almost any intelligent and patriotic voter to "hire" a President, or a governor, or a Senator, or a Congressman, a great many of those who actually are chosen, under the methods of selection followed in practice, "wouldn't have a chance."

Therefore, at the very start your expressed choice, even in "talk," is governed somewhat by the chance which your choice has, under the prevailing system of selection, of becoming a nominee of one of the big parties, or a formidable independent candidate, or of winning ultimately in the general election.

Gets On "Band Wagon"

THERE is nothing that the average American voter is so reluctant to do as to "throw away" his or her vote on a ticket that patently hasn't a chance to win. There are some, of course, who prefer to throw their votes away, but they belong to the "great minority." It is calculated by students of the subject that the mere common belief that a ticket or candidate is going to win anyhow insures it or him an average of 10 per cent more votes than otherwise would be received. This "psychology" accounts chiefly for our "red fire" political campaigns, in which more effort usually is made to convince the public that a ticket will than that it ought to win.

Thus, even the primary thoughts of the voter as to whom is wanted, say, for President are influenced and modified by the complicated system by which the voter's choice is expressed. For one must always consider the system in connection with the choosing. You may think of your choice as a candidate of one of the big parties or as an "independent" candidate. In any event the route to be pursued, if you express your choice with any degree of success, is a circuitous and complicated one.

"There's the preferential primary, into which I can go and express myself directly," you say.

Laws now require, as stated in previous articles, the holding of primaries in from one-third to one-half of the states for passing on prospective nominees for President. Suppose there take part in those primaries enough persons thinking as you do to constitute majorities in all of them. The expression thus given no doubt would have powerful weight in the party convention affected but it would not necessarily control the action of that convention. In the first place, the delegates sent to the convention to carry out "instructions" thus given would not be securely bound by the popular expression. In the second place, they still would not comprise more than one-half of all the delegates. The others, being selected by state conventions and through other more or less machine processes, might not be similarly "instructed." In the third place, even the "instructed" delegates might have good, practical, if not moral, reason for ignoring orders given directly by the voters.

Few Vote in Primaries

FOR it is notorious that primary elections are participated in as a rule by only a comparatively small percentage of those voters who might take part in them. In the North the votes cast in the average popular party primary usually number only from 25 to 50 per cent of the party's total of votes in the prior general election. It is true, also, of the South in the case of Presidential primaries held separately from state or local primaries, which latter are there the real elections.

And one reason why a greater proportion of voters don't take part in preferential primaries for President is the uncertainty as to their expressions, no matter how emphatic, being in the end more than impotent gestures.

Thus the "popular" choosing of a Presidential nominee may run around an endless circle. The voter doesn't vote because he doubts whether his vote will count regardless of the returns from the primary. The honest delegate treats "instructions" lightly because only a small percentage of those who might have actually did take a hand in giving them.

If you don't take part in a preferential primary and are not of the politically elect, you can only vaguely let it be known that you would like to have the opportunity of voting for your favorite man for President of the United States. They are too wise to be wholly scornful of your wishes in the premises, but the politicians are more likely to press their wishes on your favorable consideration than to accept yours as theirs.

Therefore, if you, the humble voter, pursue the subject through party channels your route is a circuitous and uncertain one. For if you get anywhere on that route you must yield in considerable degree to that god of the politicians: Expediency.

Except insofar as you cast "expediency" to the winds when you depart from party channels in pursuing your desire as to the Presidency, the route of "independency" is equally beset by that desideratum. There is an exception perhaps in the case of those who stand aside in the matter of preliminaries and merely vote "independently" in the general election. They are the ones who Woodrow Wilson once declared hold the fates of both the parties in their hands. This, however, was an exaggeration, for such "independents" are only arbiters between the established parties. Though the country swarmed with them, the party system still would go on. The politicians might be a little more discriminatory but they still would be all-powerful.

The straight-out "independent" route to the White House is more circuitous even than the party route. For the laws that ostensibly have aimed at making political independency easier have made it—insofar as the Presidency goes—more difficult, albeit veritably impossible.

Even the Roosevelt-Progressive movement of 1912, vastly supported as it was, failed to comprehend all the mass of mechanistic operations which must go along with the presentation of a Presidential "ticket" in all the states of the Union. The more highly vitalized Populist movement of an earlier day likewise failed to master them, though they were much simpler then.

But supposing you do force your will through all the hobbling impedimenta which law and tradition have built up and manage actually to express a free and unadulterated choice for President of the United States. Then, even though a majority of the voters may have done likewise, you have no absolute assurance of attaining the object pursued. Two men who ran "second" in the popular voting for President have been duly elected. For by the unit system of state voting, as done through the Electoral College, not only may a man receiving a plurality only of the popular vote be elected—as frequently happens—but one who doesn't even get a plurality may be chosen. Even then it is possible, as happened twice, for the election to be thrown into the United States House of Representatives. If that happens, for example, in 1924, the "popular" voting that was done in 1920 would control in the premises; for it would be up to the present and not the next House to decide the matter. That also has happened twice.

Not So Bad as You Think

ALL of which may make it appear that you, the humble voter outside of the precincts of organized politics, can't have much to do with choosing a President.

But that is not so.

For the situation actually isn't nearly so bad as the above may make it seem to be. The average voter, if he or she wants to, can still express himself fairly effectively insofar as the Presidency is concerned. It can be done in despite of the hobbling of free action caused by the antiquated Electoral College, and all that has flown therefrom, as well as other impedimenta.

If necessary the voters can use the very instruments that seem to stand in their way, even the politicians themselves, in carrying out their will.

The reason that many think they can't is because of more or less general misunderstanding concerning the two-party system of conducting government.

"I have constantly observed," wrote Edmund Burke, probably the greatest of political philosophers, "that the generality of people are at least 50 years behindhand in their politics."

This truth is illustrated in nothing so well as in the general view of parties that has prevailed largely since Burke's time. That view has presumed that organized political parties are necessarily bad. Burke was the only outstanding figure of his time that disputed the validity of that view. A political party, he said, is "a body of men united for promoting by their joint endeavors the national interest upon some particular principle in which they are all agreed." Even Sir Robert Walpole, more than any other person the inventor of the party system that has since prevailed in Anglo-Saxon countries, denounced parties as inherently treasonable. Virtually all the founders of our government held that view, including even the profound Hamilton whose opinion on the subject is reflected in the warning against parties made by George Washington in the immortal "Farewell Address."

So generally did even scholastic students of political science hold that the political party is essentially evil that it is only within comparatively recent time that the laws were permitted to "recognize" the existence of parties. The first statute having do with parties in America was enacted in the 1860's. Since then a mass of legislation has come to deal with the subject. The intent of this legislation was to legalize parties and perfect them. But the shaping of it has been governed as a rule by the old doctrine that political parties are inherently evil. Thus instead of perfecting and thereby strengthening them along safe and proper lines, these laws generally have only weakened the parties as institutions and strengthened them as mere machines—the converse of what was intended.

The result is that the major parties share all but an invincible monopoly on the machinery of government but lack facility for using that machinery as the public demands that it should be used. So far as supplying the mechanism of national campaigns and elections goes, the parties never before were more secure, but as instruments for carrying out the merged will of the people they never were so impotent as they are today.

However, as it has been sapped of institutional strength the machinery of the parties has been made more and more amenable to popular control. It is now more or less possible for strong groups to usurp the machinery of the parties even when needed for combating the tenets of the parties. This has been illustrated frequently in recent years, notably by the Non-Partisan League's operations.

This now can be done with such apparent ease that the writer ventures to say that 10 representative independents in each county in the United States, by beginning now and working in concert, could bring about the nomination for President of almost any meritorious man by either of the big parties next year. The Republican party, with Harding as a candidate, might be excepted because of the overwhelming machine strength which adheres to the mere occupancy of the White House.

Organizations Are Strong

BUT while it can be and frequently is done it is not so easy for independency to "bore from within" the parties as the above and other statements may make it appear.

For illustration, it generally is true that one capable "worker" in each voting precinct can bring about the nomination and usually the election of almost anybody for the average state house office below that of governor. But anyone who ever tried to form such an organization, from the "ground up," knows how difficult it is to find and motivate a single capable "worker" in every precinct of only one state.

It is that way as to the 10 independent-minded citizens in each county of all the 48 states, who might by co-ordination of effort accomplish, through even party channels, what would amount to political revolution. They are there but to find them and induce them to work cohesively calls for a species of organizing genius rarely identified with independent political movements.

The traditional machines of the parties include most of the trained talent for political organization. That's why it is very hard, even when law and custom seem to make it easy, to take a party machine out of the hands of those accustomed to running it. It is much easier, in fact, to force candidates upon than to change the inner complexions of party machines.

And in all the country, perhaps in the world, there is no kind of organization which in certain elements of strategic strength can be compared with those of the big parties. These party organizations were not produced overnight; they are the result of evolutionary growth that has gone on since the country was founded.

A Solution to Be Offered

THERE are many organizations numerically larger than the parties. It is doubtful if the names enrolled in the records of either national committee of the big parties—that is of "committeemen" and other genuinely "active" adherents—total more than 100,000.

But with an organization whose purpose is to control national political action, distribution is as important as numbers. And there is no other kind of organization, neither church nor fraternal order, nor federations of labor unions, nor other occupational groupings, which, like the big parties, can look to at least one person in virtually every voting precinct in the country to do, in reasonable measure, errands for the promotion of the "cause." Even the vast official organization of the Federal Government, with its thousands of postmasters everywhere, is not so minutely distributed.

Thus to "buck" the established party machines, either from within or from without, depends for success on such a widespread tide and cohesiveness of spirit as to be capable of achieving actual revolution.

But if taken too literally that statement becomes an exaggeration. While it requires something tantamount to political revolution to overcome or usurp the national machines of the major parties, still if the average voter realized how easily, after all, it might be done the obstacles would disappear like chaff before a March wind. But the average voter doesn't realize it—doesn't because of misconceptions of the awesome "strength," or its basis, of the party machines as national structures. For the basis of that "strength" consists far more of popular illusion than of physical fact, no matter how great and formidable the latter may be.

Why this is so will be set forth in another article.

TOLBERT R. INGRAM, Denver, Colorado.

Christ's Time in Newspaper English

Denver Man Publishes Seven Issues in Modern Daily Form

By OLNEY NEWELL

WHEN a man's father, mother, two sisters and three brothers have yielded their lives to relentless tuberculosis, the sole survivor may well conclude that the time has come for him to move on.

This briefly tells why a few years ago Tolbert Ingram, born and reared at Clarksville, Tennessee, bade farewell to the Southland and sought the blue skies and bracing atmosphere of Colorado.

Arriving in Denver, he obtained employment as a reporter on one of the daily newspapers. He possessed the proverbial "nose for news" and never allowed the paper he represented to be "scooped" on any local happening or event of interest to the public. Ruminating one day on the evolution of the newspaper during the century that had passed, it occurred to him that an interesting daily chronicle of events might have been printed and published at any period of the world's history had there been the mechanical facilities and that it would have been as popular and interesting in its time as our publications of the twentieth century. He conceived the idea of allowing his imagination to carry him back two thousand years to the Holy City and find there the material for the pages of a daily newspaper. To employ his own words, he "sought to bridge the great chasm created by the lapse of time and carry his readers back with him to the beginning of the Christian Era."

He gathered about him the books and writings of ancient history and studiously proceeded to create the proper atmosphere in which to produce a paper patterned after the journals of today but detailing what happened or might have happened at the beginning of recorded time.

So was born *The Jerusalem Herald*, the first number appearing with the following head and date line:

"THE JERUSALEM HERALD"
"Jerusalem, Judea, Thursday Morning, December 25, 4 B. C."

It was a six-column folio and in general appearance quite as attractive as the dailies of today. It was illustrated, too, with pictures of people and scenes known only as described by ancient painters and writers. Answering the question—"How did you get the illustrations?" Mr. Ingram said: "From photographs of paintings by the old masters and portraits of historic characters as found in books on ancient history." From these, local newspaper offices made etchings for the *Herald*.

Mr. Ingram carried back with him twentieth century ideas of the present-day newspaper. On the upper left-hand corner of the first number you see in "box":

"The weather, Jerusalem: Fair today;
rising temperature."

There is an account of the enrollment of the persons and property of Palestine in accordance with the decree of Caesar Augustus.

There is also an account of

"Luther Sabion, who lived in Jerusalem for more than forty years and who at one time played an important part in the history of the Empire by preventing King Herod's mother-in-law, Alexandra, from escaping into Eygpt to join the late Queen Cleopatra, is here to register and be taxed in response to the decree of Caesar Augustus."

The rumor of the birth of the Savior is given extended notice which opens with the following paragraph:

"Netophah, Judea, December 25.—A number of Shepherds from the surrounding hills arrived here shortly after the beginning of the third watch tonight with reports of having witnessed, while guarding their flocks, a remarkable vision in which an Angel, surrounded by a brilliant light, came from out of the skies and stood before them and announced that a king of Israel, the long-promised Savior of the Jews, had just been born in Bethlehem."

The editor of the *Herald* believed in the freedom of the press. He was not afraid to tell the truth and had a sense of humor as well. He wrote:

"The modesty of some members of the Sanhedrin in declining to discuss the ailment affecting King Herod is something remarkable.'

"The *Herald* is fully aware of what is troubling the king and is not afraid to tell what it knows. The king is suffering with common distemper and every day when he visits the temple, he barks like a dog."

On the "Society" page is an account of the marriage of Sarah, daughter of Nicodemus, with a stunning portrait of the bride.

"The tongues of society have been wagging vigorously during the past few days in the court of the women at the temple and in the circles of the elect over the well-defined rumor that Sarah, the eldest daughter of Nicodemus of Sanhedrin, has become betrothed to Joseph, son of Adrian, the goldsmith. The rumor even goes so far as to say that the dowry has been arranged and that the date on which the bride will be brought to her husband's house has been chosen."

"It pays to advertise" was appreciated early in history, for we read in the *Herald* under the display head: "Are you going South?" the following:

"Simon of Gaza, the muleteer, will depart from Jerusalem with his caravan for Alexandria, Egypt, and intermediate points, on the second day of the first week of each month, parties desiring to go to Hebron, Gaza, Beer-Sheba, Alexandria or Memphis, are invited to join the caravan."

In the want-ad column we read:

"Wanted—Helper in Tannery, Pay ten shekels per week. John, the Tanner."

"To makers of new wine—I will have for sale soon between 300 and 400 new wine bottles of Cilician Goat skins, which I will sell for reasonable price. Saul of Tarsus, Tarsus, Celicia.

These extracts from the first number of the *Herald* are sufficient to indicate Mr. Ingram's conception of the kind of newspaper a wide-awake publisher might have printed two thousand years ago. He began with the announcement that he would issue seven numbers in as many consecutive days. He redeemed that promise at serious pecuniary loss. The paper brought him no money but attracted the attention of theologians, biblical students, college professors and librarians throughout the world, some of whom saw in it an instrument that would awaken interest among all thoughtful, reading people in the story of the Savior and his times. He was urged to continue its publication. It was hinted that there were men of wealth who would doubtless supply the necessary means but nothing of that kind materialized. This was eight years ago. Since then he has been battling with the problem of life in other lines of his profession.

After completing the publication of seven numbers of the *Herald*, Mr. Ingram arranged them in sets for mailing, and sent them to a limited number of persons distinguished in the world of letters.

The responses were most gratifying to the publisher justifying the belief that he had "builded far better than he knew."

It is the dream of Mr. Ingram to resume the publication if a turn in Fortune's wheel should make it possible.

It it apparent that some of the events could not be handled in the same manner in which they would be treated by a person writing as of today for the reason that the significance of some of the happenings were not known at the time the articles are supposed to have been written. Their significance developed as the event progressed.

The author sought to carry along with the principal story items of current news and editorial comment for the purpose of developing the local color and showing political, social and economic conditions at the time of the birth of Christ. These took the reader through the intrigues in Herod's palace; the spirit of revolt existing among the Jews; the effort to complete the rebuilding of King Solomon's Temple; the methods of the Romans in taxing the people; and the social customs of the day. Advertisements of the bazaars were run for the purpose of showing the class of merchandise sold, the methods by which they were handled, and the kinds of money used in conducting business. Classified ads were printed to throw a more intimate light on the smaller affairs of life and a sporting department chronicled the happenings among the gladiators, the charioteers, those who fought wild beasts and other sports of the day. The social news took up the betrothal of a Jewish virgin in one issue and carried the item through the various issues to and through the marriage ceremony for the purpose of illustrating the customs prevailing at that time. The same idea was followed throughout the seven editions.

The first number was dated at Jerusalem on December 25, 4 B. C. (Christmas morning). The birth of the Christ was printed in this edition in the form of a dispatch from Bethlehem, on the last page, merely as an incident to an account of the crowded condition existing in the towns owing to the volume of travel necessitated by the enrollment proclamation of Caesar. There was nothing occurring in the manger at Bethlehem to show the significance of that event. However, on the first page the lead story consists of a dispatch from Netophah telling of a wonderful vision witnessed by a group of shepherds in which there is revealed to them the birth of the long-heralded king of the Jews and who are told that the child will be found in a manger in Bethlehem. The two events are connected up in a second edition dated December 26, when the shepherds arrive at Bethlehem and find the babe as told them in the vision.

An interval of three months is supposed to elapse between the second issue and the third which is dated April 2, 3 B. C., in which the lead story tells of Jerusalem being thrown into a turmoil by the arrival of a group of wise men from the East in search of the King of the Jews whose star they had seen. Herod, believing a revolt is being planned, calls a meeting of the Sanhedrin to discuss the situation and Joazar, the chief priest, reassures the people. It develops that Mary had actually been in Jerusalem with Jesus several weeks previously and had received the rite of purification in the temple. Herod informs the wise men that he will recognize the babe as king if reports are found to be true.

The issue of April 4 chronicles the arrival of the wise men at Bethlehem, their acknowledgment of Jesus' kingship and the bestowal of gifts of great value upon the mother. The wise men secretly depart for the East without returning to report to the king as instructed. The soldiers surround Bethlehem that night and at the appointed hour massacre all the male babies under two years of age in an effort to destroy the Christ Child. A description of this massacre and the harrowing details are told in an extra edition of the *Herald* on the morning of April 5. Herod's bloody record and list of victims are printed in boxes. The next issue, also an extra, dated April 6, has a ribbon head saying: "Jesus the Christ Child Lives; Antipater, King's Heir Dies." The story tells of the escape of Mary and Joseph and the Child into Egypt and of their safety from Herod's wrath. This ends the series.

The seven issues are illustrated with photographs taken from the famous paintings, special poses and from pictures made in Palestine. One edition carries an interview with Mary handled in a delicate manner so as not to give offense, in which is told of the miraculous conception. Interviews with prominent men bring out the prophecies relating to the birth of the Christ.

A large advertisement, "Rome Invites You To Come," tells of the Circus Maximus, the great amphitheater with a seating capacity of 250,000, the fights of wild beasts and gladiators, conventions in music and sports of all kinds, throws lights on happenings in Rome. Many other features contribute to the interest in the unique publication.

Copies of the paper have been placed for permanent preservation in libraries of Columbia University, Congressional Library at Washington, the Garrett Biblical Institute, the Imperial Library of China, and other prominent libraries.

Buffalo Wiped Out by Greedy Hide Hunters Aided by Federal Government

Army at Time Was Engaged in Fierce Warfare With Indians and to Exterminate Red Men It Was Necessary to End Food Supply

By F. J. CLIFFORD

This is the second of two articles by Mr. Clifford

WHEN the white man came and saw the great herds of bison, he proceeded to measure them in terms of sport and money. Hide and leather firms sent forth their hunters, armed with any kind of firearm obtainable, until the appearance of the old single shot Sharps rifle, the buffalo gun, in 50-70 and 50-110 caliber, weighing 14 and 18 pounds respectively. The gun was too heavy for most men to hold out from the shoulder, so the hunter usually had a small tripod on which to rest it when shooting.

When first discovered, the buffalo was what might be called tame, though indifferent would be a better term.

The appearance of man did not disturb them. Travelers were often held up for days, when the bison were on their annual migration, and blocked the path for miles. The hunter had no trouble usually, in slipping up quietly from some depression in the prairie, and sitting down with his heavy rifle resting on its tripod, and picking off the animals on the outskirts of the herd. If a buffalo should become uneasy at his presence and start to walk away, the hunter would immediately kill him to prevent the feeling of alarm spreading through the herd, and in this way he could keep the herd in one place until he had killed enough to keep his two skinners busy for the day. It would mean about 18 hides for each skinner, though, of course, some would do more.

A man had to be an excellent shot to hold this job, as most of his shooting was around two hundred yards, and it was very necessary to make a clean kill each time, as a wounded animal would do so much thrashing around, the herd might become alarmed and stampede, maybe away, maybe straight toward the killer, which could easily develop into a rather unhealthy situation.

None of Meat Used

THE killer did no skinning, such menial work being much beneath him. Instead, he would cut off the heads of the carcasses as fast as the skinners were through with them, and place them in a semicircle, with the largest skulls taking up the end positions, after which he would decorate the ends of the black horns with bits of bright cloth. Some of the hunters were so vainglorious as to sacrifice parts of their clothing rather than to let the scene of their day's kill go undecorated. There they would leave them waving pitifully in the western wind, mute testimony of the white man's prowess and utter thoughtlessness.

One old Indian fighter I talked with told of seeing as high as a hundred and twenty skulls in this way; where a killer had a number of skinners with him, every horn was decorated. How the proud victor could have gloated over the slaughter, especially when he saw the tons and tons of good meat left to rot, is hard for us of this day to understand. Some of the hide hunters became so greedy, especially when they saw the herds rapidly diminishing, that they resorted to pulling off the hides with a team of horses, but this was not very successful as it took some flesh with it, making it slow in drying and of less market value.

The hides were spread out on the prairie where the hot sun and dry wind soon made them into "flints," after which they were hauled to the Missouri River, where they were stacked up like cordwood, the piles stretching down the river for hundreds of yards. Then they were shipped everywhere, England taking large quantities of them, making them up into all kinds of leather goods.

Toward the last of the era of the buffalo the dealers appeared more secretive about the hide business, keeping them more out of sight, sometimes shipping them as something else. A smuggling appearance prevailed about the business. The reason for this furtiveness I never clearly discovered, but one old-timer hinted that the dealers still possessed a little conscience and felt somewhat ashamed of the wholesale slaughter. Others thought that the government was suspected of trying to stop some of the vicious work it had been guilty of fostering.

Cody Helped to Kill

BUT the work of extermination continued. When they could no longer kill them in the way I have described, they took to the horse and rode them down, killing them for sport. Many foreigners made the journey from England to the western plains just for the royal sport of killing the huge beasts. This aroused much animosity among the local inhabitants, for although they might indulge in the sport themselves, they disliked to see a foreigner follow their example.

It was in this period that William Cody (Buffalo Bill) got so much of his notoriety, guiding rich foreigners on hunting trips and supplying buffalo meat to the contractors on the railroads. I am sorry to say that the grand old plainsman never did a thing that I ever heard of to preserve the buffalo.

About this time the cattle men began crowding onto the buffalo range with their stock. But wild buffalo crossed with domestic cows, and the calving period was fatal to the latter, due to the conformation of the buffalo-fathered calf. So many cows were lost from the cause that it became clear that just as long as the buffalo ranged the prairies, just so long the cattle men would have to stay off with their stock. This was another stimulus toward the extermination of the buffalo.

Here is another strange cause for the warfare against the bison. About this time the Indians of the plains were doing some of their bitterest fighting to save their families and tribes from starvation, as *they depended almost entirely on the bison for their food and clothing. By killing off the buffalo the government hoped to starve the Indian into submission.*

How Government Worked

THE government took a unique way of exterminating the bison:

Ammunition for the heavy buffalo gun was very expensive, but if one would go to a government agency at Kansas City or any other point *he could get it for half price if he would take oath that he would shoot it all into buffalo.* There you have it, the simple truth as all old-timers know it.

Occasionally a band of desperate Indians would stampede a small band of *their* buffalo off up in the hills to some distant secluded valley in the hopes of saving them. But the hide hunter seldom failed to locate them, and ofttimes the maddened Indian would turn on and kill the entire hunting party. Then the eastern newspapers would carry screaming headlines, "HORRIBLE INDIAN MASSACRE," and demand that troops be sent forthwith to bring the redskins to justice.

More and more did the buffalo take to the hills and higher plains, refusing to come down in the autumn to their old wintering grounds. There in the higher levels and deep snow of winter, swept by the brutal winds, the dwindling herds perished by the thousand.

During the winter of '79 and '80 the southern herd retreated to the slopes and ravines of the Yellowstone Park, the winter of the big snow, the Indian would say, "Hi-u snow mebbe two squaws deep."

The Year They Didn't Come

WHEN springtime returned the prairie again put forth the rich green bunch grass over all its mighty breast as though anticipating the return of its children, but her children, the buffalo, came not. Instead they were sleeping the long sleep in the dark ravines of the mountain, where they lay row upon row, or perhaps out on the slopes where they had tried desperately to reach the life-giving grass of the mountain. To this day you will find their bones there, bleached white and slowly dissolving back into the earth that gave them, dumb evidence of the survival of the fittest, driven beyond their fitness.

The people of the plains looked much for their return, and wondered why they came not. The Indians, gaunt, sullen, disheartened, sought the agencies for sustenance, others whose pride would not let them seek aid of the hated white man, slowly starved to death in their tepees—and the old happy Indian days were soon a dream on the far horizon of the past.

The northern herd held out somewhat longer, finally disappearing in the foothills of the Rockies above the old wintering grounds of Alberta. This was the reason for the answer heard for years afterward in the States. When one inquired where the buffalo had gone, it was said, "Oh, they have gone up into Canady." That answer persisted for years, as though men were loath to admit that the buffalo were really gone.

A few straggling buffalo were left in the foothills of Wyoming, Colorado and Montana, which the government made a much belated attempt to save, but the butchery had been too great. As bison became fewer the hunters put forth greater efforts to kill what remained.

Buffalo Jones, "the savior of the buffalo"—a hero seldom heard of—smashed his rifle one day and swore he would not kill another buffalo, but do all he could to save them from extinction. It is through the efforts of Buffalo Jones that we have our few buffalo today.

He tried first to domesticate the mature animals, and failed; captivity killed them. Then he started catching the calves, a most dangerous undertaking. Often he had to invade Indian territory, where discovery meant certain death.

But he persisted and ultimately won out, and may it be said, to the everlasting disgrace of our American press, that it let the fine old plainsman go down to his grave unhonored and unsung, compared to the praise they dished up for Buffalo Bill. There was no comparison between the two men. Jones was a man of quiet nature and one who did not seek publicity. I could say much more but I won't. Suffice to say that I will not rest content till there is a proper memorial commemorating the achievements of Buffalo Jones, aside from the bison he left us. It seems so strange that the directors of the Yellowstone Park do not make some mention of Buffalo Jones in connection with the bison there. I saw signs marking Howard Eaton trails all over the park.

Even Zane Grey let the old plainsman pass out of his life forever, saying or doing nothing, that I know of, in memory of his old friend, who took him under his protecting arm and gave him the start that has made him the literary success he is today.

The last chapter of the wild buffalo is a rather bony one, as that is about all there was to it—bones, bones, bones everywhere. The early settler got his first money off the prairie by gathering up the bones and hauling them to the Missouri River, or some railroad where they were shipped out to be made into fertilizer, or charcoal for the refining of sugar. The plains buffalo furnished countless trainloads of bones to refine the sugar of the beets grown on his old feeding grounds.

The bones had to be gathered anyway before the sodbuster could mow any of the prairie grass, as one of the hard bones was sure to break the sickle of his mower.

Sometimes there would be found literally a mine of bones where the bison had stampeded over some cutbank, piling up till the balance of the herd would pass on over the fallen bodies of their companions. There is one such place in the Keyhoe Lakes country of Southern Alberta some 20 miles north of Lethbridge where, under a high steep bank, the bones lie many feet thick.

Wild Herd Ranges High

THE shoulder blade of the bison is nearly the shape of a painter's palette, and was much sought after as such, some 20 years ago.

In my trip East I talked with a Wyoming man, who said the last wild buffalo had disappeared from there some 15 years ago, an old crafty bull or two holding out that long, which goes to prove that had the buffalo that fled to the hills in the seventies been afforded proper protection, there would still be bison throughout our mountain country, instead of the 30 or 40 that make up the wild herd of Yellowstone Park. These latter are more wild than mountain sheep, so different in this respect from their ancestors of not much more than half a century ago. Whether the wild herd is increasing or not is a question, although some say it is. A ranger said that those he saw appeared larger and more virile than the ones comprising the tame herd.

The wild herd ranges high in the park, I think something over the 6,000-foot elevation. How it exists throughout the winter is a mystery, but it does in spite of the deep snow and its natural enemies. It shows no inclination to go down on the plains, as it holds all mankind in the greatest fear. How the members of this herd came there is more or less disputed among the rangers, some asserting that they are strays from the early tame herd, and others that they are survivors of the old herd of '79. But there they are just as in the old days, and the park people pin great faith to them, as being more typical of the old stock, and more apt to survive as such, than the tame herd, which has about lost its ability to rustle during the winter, and is so much more prone to disease.

Tame Two-year-olds Die

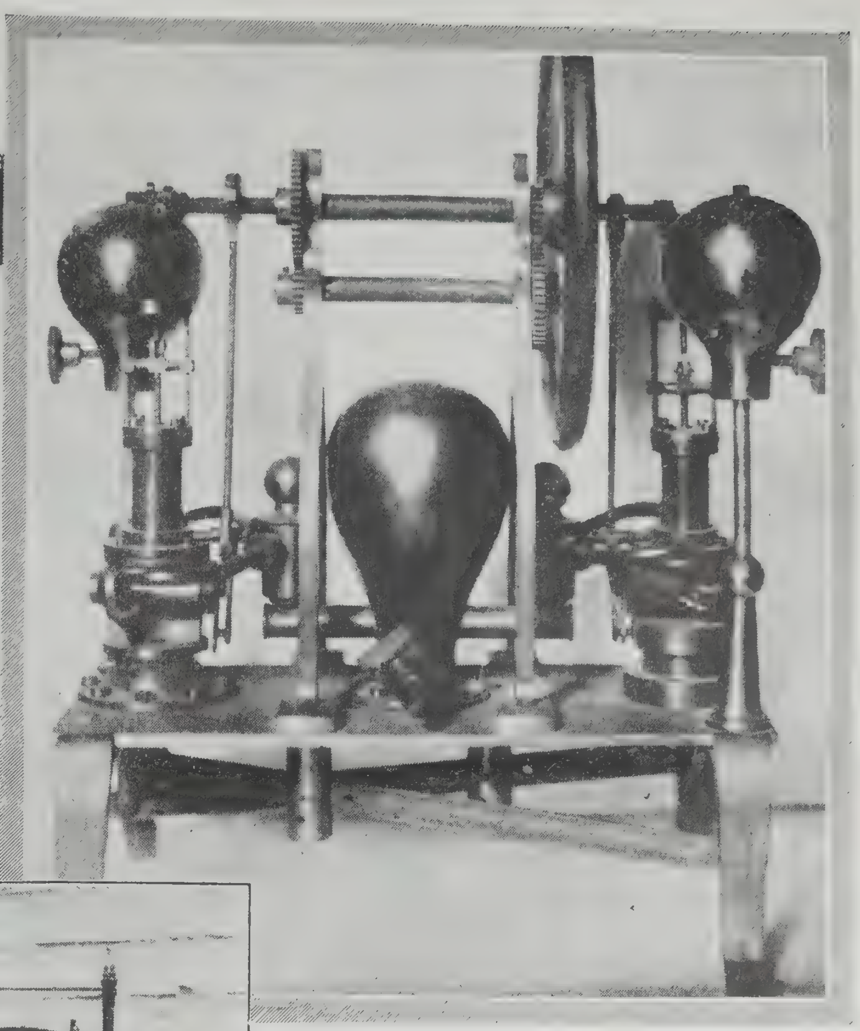
THE park lost 55 two-year-olds this last spring out of the tame herd through some mysterious disease. The affected animal first started to slobber, then bleed at the nose, and in about a day would be dead. A serum was prepared and the yearlings inoculated in the hope of saving them. The herd numbers more than 400 and has been increasing. It is under the mandate of the Bison Society of Boston. Although Congress furnishes the finances for its maintenance, the herd could be made self-supporting. Many a fine specimen of bison, dying of old age or through some accident, has been left to rot where he fell, when his head and cape would bring from $300 to $1,500. But no one would dare touch him; if they did I suppose he would be prosecuted. Some hides are taken off now and shipped to Boston.

Canada bought the Pablo herd and with those she had at Banff make up the finest herd of buffalo in America, thoroughly self-supporting, and as hardy and vigorous as in the old days. The herd is increasing so fast now that there is a steady income from the sale of the flesh, robes and heads.

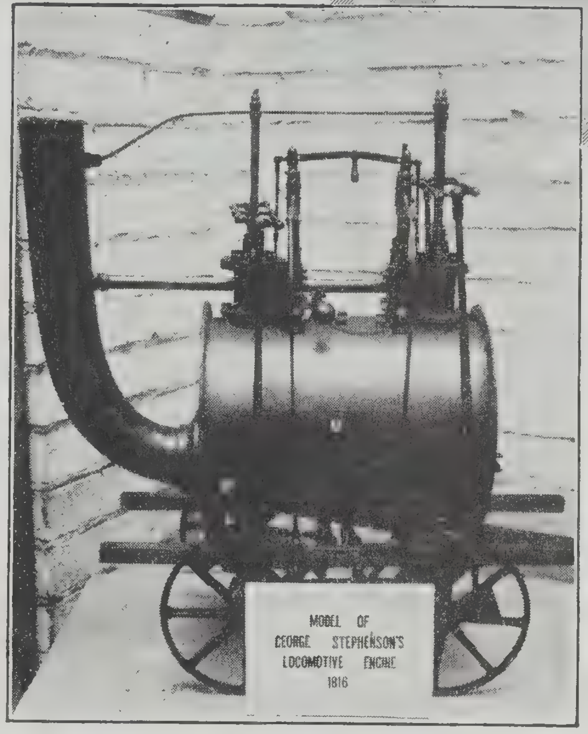
FRANKLIN MEDAL
FOUNDED IN 1914 BY SAMUEL INSULL
AWARDED BY THE FRANKLIN INSTITUTE TO
FOR SIGNAL EMINENT SERVICE IN SCIENCE

Where Perpetual Motion Got Desert

Franklin Institute Seeks Energy Facts



The Keely perpetual motion machine model in the Franklin Institute.



This model is in the Franklin Institute.

RECENT delivery by Sir Joseph John Thomson, regarded as the world's foremost physicist, of five lectures from the platform of Franklin Institute, of Philadelphia, serves to call attention to how fitting it was that the choice of such a rostrum should have been made by the eminent Englishman to describe the progress enjoyed during the year at the famous Cambridge Physical Laboratories in studying the behavior of the atom and its component parts.

Not only has the institute a most enviable record in the advancement of science and not only has it shown the most particular interest in the mysteries of energy, but its work in the exposure of scientific frauds has been magnificent. Energy in one form or another has held the imagination of mankind since the beginning of civilization; practical minds have sought in it a source of cheap power; the impractical dreamer has sought to achieve the same result, in a single bound, and at times succumbs to the belief that he has reached his goal through perpetual motion. It is a far cry, to be sure, from the person of that type to the research scientist, but it was only a year ago that one of the latter, a colleague of Dr. Thomson, Dr. S. C. Aston, of Cambridge, announced in lectures also given at the Franklin Institute that hydrogen may be the source of that perpetual-energy familiar to all in the sun.

In the light of that announcement and the further progress narrated by Dr. Thomson, it is interesting to recall that it was the Franklin Institute which exposed the greatest perpetual motion fake in history. Others have turned up from time to time, but few of them achieve the prominence—or the profits—gathered by John Ernest Worrell Keely, the model of whose perpetual motion machine is still on exhibit at the institute. A quarter of a century ago Keely, after prolonged studies, announced that he had discovered the secret of what he called universal force. He sold stock in the discovery, got more than a thousand contributors, gave public demonstrations and fooled not only the public, but many scientists.

In all of Keely's literature, and in his talks, there was a real foundation of scientific knowledge. Many of those who have studied his career believe that in another environment he might have become a noted research worker. But he wanted results too soon. He constructed a machine by which he professed to be able to draw energy from the atmosphere. That was done, he asserted, by releasing ether normally held in suspension, and the method was a secret "almost instantaneous process of intense vibratory action." By way of demonstration Keely built a liberating machine modeled after the human head, with eardrums as collectors of vibrations.

Various scientists then connected with the institute refused to admit being puzzled by Keely's demonstrations for the simple reason that he would not make them in the open. He insisted always on setting the stage in advance, in some property under his own control. He also superintended the "inspection" by skeptics. When stockholders began to demand returns he "invented" what he called the "anti-gravity" machine. It was supposed, by means of vibrations, to overcome gravity, thus lifting itself into the air to any desired height. But Keely did not stop with that. He said he could furnish it with other vibrators to give it a speed in any direction of 500 miles an hour. That stirred so much interest that he was able to make large profits by giving demonstrations of his older energy-producing machine at so much an admission. When the institute pointed to the possibilities of concealed power-producing machinery Keely was ordered by the courts to reveal his secret or go to jail. He smashed one machine and went to jail for a short time. It was not until after his death, however, that it was possible to make a thorough search of his premises. Then his secret was discovered to be nothing more nor less than compressed air, cleverly hidden in the cellar.

The institute was founded in 1824 as a memorial to Benjamin Franklin. Since then it has taken an active although at times unobtrusive part in the history of scientific research. At some time or other every really important invention or discovery comes to its attention. It has maintained since its foundation a corps of experts, picked to represent the leaders in every phase of science, "to examine and make report upon all new and useful machines, inventions and discoveries submitted to them." Countless inventors have had the advice of these men for little more than the price of a postage stamp, yet their aggregate earnings are so large that the wealthiest corporation could hardly afford to hire all of them.

A "Board of Examiners" did the work when the institute was first established, and later a "Committee on Inventions" was formed. In 1834 the present Committee on Science and the Arts took over the work. For many years membership on the committee was open to any member of the institute. Then the demands made upon its time and the importance of its work became such that the institute limited membership to forty-five men "who shall pledge themselves by their acceptance of membership to perform such duties as may devolve upon them, and to sustain by their labors the scientific character of the institute."

In such a service it is natural that the demands made should be almost overwhelming. The records show that nearly every discovery recognized by the committee in ninety-nine years and awarded either the certificate of merit or one of the medals given by the institute has come into general commercial use within a short time. When such an award is made it is published in the *Journal* of the institute, distributed among scientists, technical schools and colleges and research departments of large corporations throughout the world. The utmost caution is used in the making of awards.

The only thing necessary for the inventor seeking the approval of the institute is that he shall have something of real value. The institute will not consider an invention until a patent has been granted, of course, nor will it act where a patent is in litigation except where that action will not jeopardize the rights of either party to the suit. The rules of the Committee on Science and the Arts provide that it shall investigate "any subject referred to it by the institute, or by any of its sections, or by a majority vote of the members present at any stated meeting, it may investigate any subject presented on motion of a member or by application." An application blank for submission of any invention to the committee is issued by the secretary, Dr. R. B. Owens, on request, when it is shown that the appliance or process has merit. The following questions must be answered:

1 What is the specific purpose of this invention?
2 What is the condition of the prior art in this respect?
3 What improvement is claimed to be effected by the invention?
4 How is the improvement effected?
5 What patents, if any, have been issued for this invention?
6 What citations, if any, were made in this regard by the Patent Office before allowance of patent claims?
7 Is the invention now in actual use?
8 If so, since when?
9 Where may it be seen in operation?
10 Are you prepared to submit drawings of the apparatus or device?
11 Are you prepared to submit a model of the apparatus or device?
12 If the invention is a composition of matter, are you prepared to submit specimens of the ingredients and of the compound sufficient for the purpose of experiments?
13 If the invention is a chemical process, are you prepared to give a demonstration of the same?

It is also required that the applicant submit two copies of each of the United States patents issued to him. He should submit also whatever additional information may be called for by the nature of the discovery. Applications are first referred to a sub-committee on new subjects and preliminary examination, which recommends acceptance or rejection to the general body. Meetings are held once a month to discuss submitted subjects, but in addition to that a great deal of time is devoted to personal investigation by members of the various committees.

In addition to the certificate of merit, which is awarded by the institute for notable discoveries, there are endowments to provide for other awards. The Edward Longstreth Medal of Merit, with a money premium when the accumulated interest of the fund permits, is awarded for meritorious work in science or the arts, including papers relating to such subjects originally read before the institute and papers presented to the institute and published in the *Journal*. The Elliott Cresson Medal is awarded for discovery or original research, adding to the sum of human knowledge, irrespective of commercial value; leading and practical utilizations of discovery, and invention, methods or products embodying substantial elements of leadership in their respective classes or unusual skill or perfection in workmanship.

The Howard N. Potts medal is given for distinguished work in science or the arts, important developments of previous basic discoveries, inventions or products of superior excellence or utilizing important principles, and for papers of special merit presented to the institute and published in its *Journal*.

The chief award made by the institute, however, is the Franklin Medal. As a rule it goes only to men who have already achieved prominence. It was established in 1914 by Samuel Insull, of Chicago, for award to "those workers in physical science or technology, without regard to country, whose efforts, in the opinion of the institute, acting through its committee on Science and the Arts, have done most to advance a knowledge of physical science or its application."

An interesting fact about the institute is that although many of the men it has honored are pure scientists, meaning that they operate wholly in the field of research and are not compelled to find an immediate practical use for their discoveries, as a rule the most technical subjects are intimately related to affairs of everyday life. In the lectures by Dr. Thomson one of the points of interest to virtually all industrial concerns was the critical period of vibration for solids. Another item was the structure of metals.

The Poor Handling of Our Washington News

Concluded from page 8

political faith contrary to the politics of the Administration. It is a natural human instinct. The editor in his home office might easily discount it. But to do so, he would himself have to be familiar with the Washington scene. The editor may indeed make a point of taking himself to Washington now and then, for his own instruction. The occasional visit does him little good in the way of education. He is still the same imperfect judge of reports from Washington. So he and his Washington representatives become the highly imperfect sieve through which the country receives sometimes tragically twisted versions of what goes on there.

Absurd as it may seem, the Washington climate affects newspapermen as it affects government operations themselves. The Washington climate makes everyone lazy. It is too easy for a reporter to visit the lobbies of the large hotels, or other places where picturesque public figures are accustomed to congregate, and retail the endless amiable tales he hears at such places. Washington in its isolation is a good, typical American village. That is to say, it is shot through with gossip. This is far easier to collect than the stiff, accurate news stories that lie anywhere within a reporter's reach in Washington if he has the energy to use his legs or the street cars and cover the generous distances that creep in between the newspaper bureaus and the offices of Congressmen, Senators, Secretaries, or the other officials who are only too ready to confer with representatives of the press. The real news doesn't come out of Washington because there isn't energy enough there to go and get it in its real state.

Rely on Reporters

THERE is no other excuse. Officials in Washington are obliged to rely on the pressmen for their straightest short-cut to the ear of the American public. Officialdom has always something of importance to say to the public, and accordingly it has always something to say to the reporters. All the reporter has to do is go and get it. This he too seldom puts himself to the trouble of doing. Another reason has been supplied why the great volume of live news, news of often dramatic interest, in Washington, is so seldom retailed to a waiting and avid public.

Time was—and it is not so long ago—when the typical Washington correspondent was a seasoned newspaper worker. He was never intrusted with the important Washington job until he had shown capacities of judgment and enterprise such as entitled him to the distinction. Usually he was a sage, in his way. He had been about among men. He was a student of affairs. Few persons could fool him. Above all he had editorial capacity in comment on public affairs. His reports from Washington served as real information, real guidance to public opinion. Men of this type still function there.

Yet forces outside the control of the newspapermen themselves have served to disrupt the news service in Washington. Strangely, it was President Roosevelt who contributed chiefly to this. Roosevelt was accustomed to lift the hair on the heads of newspapermen with the outspokenness with which he confided to them personally the "low-down" on large affairs, domestic and foreign. But all this was "under the newspaperman's hat." He never dared betray these matters confided to him under the seal of secrecy. In fact, so much was confided to him in this manner, that his work was tremendously complicated. So much was left to his personal sense of honor, to his personal judgment, that he feared to relate even the simplest and most harmless of facts. In consequence a habit of another sort settled itself over the correspondents. They put on the wire only the most "smooth-bore" general gossip. The habit prevails to this day.

Unknown to People

IT IS hardly hyperbole to say that Washington, the seat of the national government, the scene of most momentous interests and activities, is almost wholly unknown to Americans.

It is not the only scene in which the hard facts of the news take on twists away from truth and accuracy. At no point is the government so badly served in its contacts with the public, through the press, as in matters of immigration. The story of this is too long to retail at this point. It is another chapter by itself. An instance or two of innocently and even zealously erroneous reporting will have to suffice.

Recently eastern newspapers have carried elaborate news stories of the sad case of a Rochester boy (Sammy Goldman) slated for deportation. He got into the country during the war. Expert medical testimony in his case is overwhelmingly to the effect that he is a hopeless idiot, and as such is subject to deportation by mandatory statement of the law. Yet endless "sob" stories about this lad have appeared in the newspapers. Two governors of the state in which he lives have been moved to exert themselves in his behalf. A wholly false picture of the boy's case was first presented to these officials, and then to the public. Stirred by these mistaken pictures, civic bodies have spent money and energy to have the boy retained. The truth and the facts are against them all. After inconceivable efforts in the schools to put the boy in a position where he might, even in parrot fashion, recite enough information to get him past the immigration tests, he remains what he was—an idiot. The files of the Immigration Bureau bear telltale evidence as to the truth of this. It is as nothing against the weight of public sympathy aroused by news stories, well-meant but mischievous in effect.

More recently still an Italian woman who had arrived in a first-class cabin on a large steamer was sent to Ellis Island for examination. She represented herself as the wife of a prominent Italian banker. She quickly reached the ear of the newspapermen. Her story was dramatic and appealing. The accounts of her case published in the public prints aroused wide interest and discussion. People wrote in indignation to the editors and asked if the government could not use some decency and common sense in its blind handling of the immigration law.

It would hardly do to reveal the real facts behind this case. The files of the Bureau of Immigration carry the sworn testimony nevertheless. An enormous amount of public sympathy had been stirred in behalf of a person little entitled to any such generous outpouring. And instances of this sort repeat themselves almost daily.

Whether the quality of newspaper reporting has fallen off in recent years might form the subject of another discussion altogether. The fact remains that, especially at important news centers, the real news of the day is imperfectly presented to our public. This other fact remains: that the reporting is imperfect not from vicious or sinister motives, but from sheer carelessness. *But it is imperfect, it is inadequate.* The real news seldom gets into the newspapers.

Better Pay, Better Men

THIS is said without the slightest intent to disparage the work of newspapermen. No body of workers in the United States is more conscientious on the whole, or works harder, on longer hours, or for so little pay. The fault lies not with the individual or with the newspaper body, but with the system under which that body works. Great papers suffer by it as much as the little. Any search for the remedy offers a deep problem. That is not here our concern. A reporter who can accurately record facts of importance, without obstruction from his own limitations of judgment, would be worth $10,000 a year to any paper. When that sum of money is offered, it may be that men of the caliber to fill the job will make themselves available.

In the meantime it behooves the public to read its newspapers with restrictions and likewise with indulgence. They do their best, but they are not infallible. The mischief they do is in stampeding public opinion in the wrong direction as a result of their own mistakes. The public holds the remedy, the safeguard, in its own hands. Until the handling of the news improves, it should take its daily news-offering with a grain of salt and with the exercise of judgment on its own part.

Shall We Have an American Opera?

Concluded from page 3

passing phase in cultural development, albeit a long time passing in our own particular case. Nevertheless, the day of the American composer and librettist will come.

"So far, a dozen American operas have been produced; hundreds have been written, and it is true, also, that the best of those written have not been produced; it would not have been to the advantage of the foreign impresario to produce the best of American music. Some day an American manager will arise, who will obtain a real American opera, one that means something to our country and to ourselves. And with the first American operatic success opera in our own language will be here to stay, while the foreign influence will decline, slowly, perhaps, but eventually it will disappear. Pioneers have a hard time in any field, but particularly so in opera. Sometimes the writing alone is a work of years, and then years more are spent in an ineffectual attempt to get a hearing, with ultimate disappointment, through the deceit and trickery of those foreigners whom we allow to dictate to us what music we shall hear.

"If by some great good fortune, a hearing is given to an American opera, perfection is expected at once; nothing less will satisfy these foreigners. In other fields of art one may start modestly and grow. Of all the operas that Puccini wrote, or of all those composed by Verdi, how many are known? How many are presented? An early Whistler or MacMonnies cannot be classed with later and more mature work. Yet in American opera, the composer and the librettist must scale the heights at a single bound—and the first bound—or be forever hurled into outer darkness by the emissaries of music 'as is' from Rome or from Jerusalem.

"At present, an opera will not be considered from an American composer until the score is completed. The only consideration given the libretto is to use it as an excuse for rejecting the score. The impresario informs the composer that his music is excellent but the book will not do at all; and this has happened in half a dozen cases, to my own knowledge. Yet, as a matter of fact, American operatic librettos will compare favorably with any yet written in any language."

Mr. Moyle's latest libretto, which is now being turned over to an American composer, probably Cadman, to supply the music, is the newest attempt to provide America with an American opera. It is entitled "The Traitor," and is concerned with the treason of Benedict Arnold and the events which led up to it. Moyle has found thrilling romance in the days preceding Arnold's defection and scenes of splendor seldom shown in the somber history of the colonies.

Washington! Wistful, Wasted and Waiting

Concluded from page 2

ist stranger who enters the maze without the precaution, "Pick your exit now." Only the stranger knows how easy it is to run out the wrong spoke of the wheel, and at the end of twenty minutes find himself miles out of his way and his notion of the points of the compass hopelessly askew.

These, and that still more bewildering maze, the singularly cool gully in the northern hills, Rock Creek Park, with its zoo and its fords, be at least a few of Washington's amiable absurdities. But its very isolation, its self-containment, its supreme contentment with itself, its cool indifference toward everything without its own borders, the balmy climate that softens life to a leisurely pace—these are making the Washington of the future. These, and the charm of its sociability, and the variety of its social interests and the color of its many classes. Old and wistful residents there will tell you they have long observed their city moving to the day when it may vie with any capital in the world. It is true. Nothing is wanting but time. And except for space, no commodity is more plentiful than time in Washington.

Not that it will ever sting the pride of the vulgar who take greatness to consist of volume of population. Not long ago a distinguished and beloved public official put into a sentence the nearly permanent size of Washington. This official—who stutters delightfully—it seems was stopped on a corner by a hurried stranger who demanded:

"Tell me the shortest way to the Union Station!"

The dignitary looked down at him and said, "Th-there are f-four hundred and f-fifty thousand people here. Wh-why the de-devil had you to p-pick me out for su-such a question!"

The four millions are not for Washington. It will never be a city of the many. But it will be a city of the distinguished—the distinguished outside as well as inside the circles of government and diplomacy. It is becoming that sort of city already. The tide of wealth and fashion and achievement has already set in. Persons of means who have learned the use of means, who have finished the making of money and have begun the living of life, are more and more seeking the company of their like in the expansive leisure of Washington. A residence in Washington has become indispensable to families of great name, or great fortunes, or both—enough of them to have set a fashion that others of their kind begin to follow. Within a short stretch of years clusters of their houses have mushroomed in upper Sixteenth street in the neighborhood of Meridian Park—one of these days to become the loveliest dazzle of its kind—in K street, in New Hampshire avenue; finest of them all, in Massachusetts avenue where it approaches its northward turn at Sheridan Circle. Here are mansions not outdone about Central Park, or Hyde Park, or the Parc Monceau. Roomy Washington affords these places a gorgeously gardened surrounding. It supplies their owners with the company of the distinguished, the cultivated, the famous, the powerful, from every quarter of the world. At the base of the social pyramid, Washington may be a great village. At the peak, it is a microcosm.

It is the more a microcosm because it is fashioned of more than the powers of politics and society. Men of science, the writers, the artists have discovered Washington. In its spacious comforts, its quietude, its dignity, its physical beauty, in the charm of its company, they find an atmosphere that permits meditation, that invites the exercise of talent. Their names are sprinkled over the membership lists of the clubs, the columns in the newspapers consecrated to social interests. From the day of its founding Washington has entertained the great of the earth. Now it begins to contain and to hold in the grip of its charm the illustrious and the picturesque among our own people. Henry Adams, John Hay, and others of an earlier day, who went to Washington only to visit or to work, and remained to live, seem to have made themselves the head of a real procession. The procession may be slow, but it is on the move.

So, after all, it may be that the fathers were right in pitching their capital at a far point of detachment. President Washington and Major L'Enfant may have had the superior foresight. They exiled their government; but they did give it room and quiet for deliberation, away from the passions passing in the crowd. The same room and quietude they offered to endeavorers in other fields than government—as those endeavorers are learning. Hence it is more than a pious wish that sets Washingtonians to predicting for their city its day as the true capital of our country. The wish is born of sense, and, even though slowly, is coming true. Willingly enough good Washingtonians let commerce and its enterprise, population and its bulk, look elsewhere, as they watch human fiat accomplishing there what Nature herself has elsewhere denied to America—a capital of the mind.

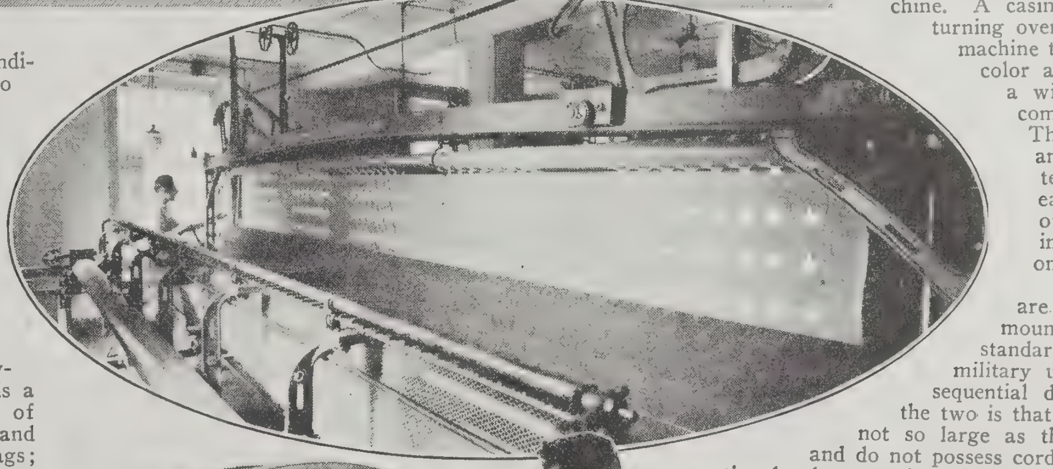
Uncle Sam's Own Factory Makes Army's Flags

Far Cry From Betsy Ross' Deft Fingers to Machines of Today

By S. R. WINTERS

EACH recurring June fourteenth is occasion for observance of Flag Day, especially in the schools where appropriate ceremonies recognize the significance of the national emblem. With the passing of another June, the Stars and Stripes as a symbol of nationality is 145 years old. The frequency of the appearance of the flag of the United States—fluttering in remote as well as thickly populated points on land and sea—would seem to indicate that knowledge concerning Old Glory is common property, indeed. Betsy Ross and the countless patriotic and romantic tales relating to the fashioning of the first Stars and Stripes are on the tongues of children. Grown-up members of the family are not unmindful of the fact that the 13 stripes on the flag represent the 13 original states of the Union.

Sentiment, instilled by patriotic exercises celebrating the anniversary of the making of the flag throughout the land, compels a common knowledge in the above-mentioned particulars. Strange to say, however, probably not one person in 10,000 is familiar with the structural environments of Old Glory—where, and under what conditions are flags of the United States manufactured. One hundred and forty-five years have elapsed since Mrs. Elizabeth Ross, according to tradition, fashioned by hand the pattern of the Stars and Stripes, from a house in Philadelphia, at a point later identified as No. 80 Arch street. The progress of modern science, giving to the world its labor-saving machinery, would not sanction the conditions of manufacture then obtaining, it is reasonable to assume. Sentiment, however, decrees that the Quaker City, the birthplace of the Stars and Stripes, shall remain the cradle of the flag through the changing centuries. Instead of Betsy Ross patiently fingering the symbol of a new-born nation, a traditional picture of 145 years ago, today scores of machines have increased production a hundredfold. And, thereby hangs a tale of how Uncle Sam is manufacturing flags in quantity lots.



Above—Stitching stars.
Oval—Embroidering the stars.
Below—Stamping out stars.

The manufacturing branch of the Quartermaster Intermediate Depot, located in Philadelphia, is responsible for the production of all flags in the service of the United States Army. The assignment is a comprehensive one—ranging from the manufacture of the President's flag to productions including colors and standards for regiments; garrison, post and storm flags; automobile, distinguishing and transport flags, and ensigns, harbor boat jacks, pennants and guidons of a variety of assortments. The fragment of bunting which defies the raging storm when stationed over a fort on the seacoast as well as the rich silk colors that thrill the members of a warring regiment are alike the machine-made products of Uncle Sam's flag factory in the Quaker City. With the exception of the colors and standards carried by troops, and camp colors, our national flag resolves itself into a dozen sizes. This is in conformity to an Executive Order, dated October 29, 1921, which fixes the hoist of flags.

The making of Old Glory in quantity production and in response to the dictates of economy is of comparatively recent origin. Progress in this direction has marked time with the development of the needle industry. Not unlike Betsy Ross who fashioned the national symbol with her fingers, not so very long ago an entire flag was constructed by a single operator. Today, the task is allotted to 13 units of operation. Piecemeal-like, each worker in Uncle Sam's flag factory is assigned the job of contributing a definite bit of workmanship, these progressive units making for a finished product. National emblems are constructed of red, white and blue bunting; the stars, which are stitched to the blue field, are of white percale.

Bunting—a thin woolen stuff used primarily for making flags—is painstakingly inspected before being issued to the cutting machine. It is placed one ply upon another and severed to specified length until a section 100-ply high is available. Forthwith, the material is marked and subjected to an electrically driven cutting machine which parcels the bunting into strips of two lengths, these entering into the manufacture of the Stars and Stripes. The procedure followed in cutting the blue bunting for the field is not dissimilar from that of cutting the long and short red and white stripes. The elasticity of the structural material involves the exercise of utmost care in the laying-up and cutting of it lest precision be sacrificed; accuracy being essential in joining the stripes on a sewing machine. The material on which stars are planted is stamped out with a steel-cutting die on an electrically driven stamping machine. Cutting by the latter method insures maximum production and uniformity in size and shape. The canvas heading on the flag is fashioned in a similar manner.

The cutting machines having performed their assignments, the component parts of the potential Old Glory are bundled and consigned to the operation room. The abbreviated stripes are joined together alternately red and white on a double-needle sewing machine, which negotiates two rows of stitching at a single operation. Simultaneously and in like fashion the long stripes are joined and the field made. The blue field is placed on a table, any wrinkles removed, and the correct position of the stars indicated on each field, employing a perforated pattern. After being subjected to a squaring process it is cut to exact dimensions. A piece of white percale, somewhat larger than the star, is placed on the under side of the field, and a star of the material placed in the same position on the upper side. This insures three thicknesses. The operator then stitches cautiously around the edge of the star with a zigzag machine. Once the stars have been fastened on the field, a trimmer robs the product of excess percale due to the stitching on the under side of the field.

The field and short stripes are then united and both are joined to the long stripes, these unions being effected by a double-needle machine. Then, the flag is smoothed out on a table, squared and cut to precise dimensions. The fly end is turned in and hemmed with three rows of stitching on a single-needle sewing machine. The other end is reinforced at each corner with a triangular strip of bunting, and stitched into a canvas heading. It is reinforced by means of a single-needle sewing machine of a heavy design for this operation. Each flat is equipped with a galvanized iron staple and ring, well riveted, one in each end of the heading, for hitching to the halyard—a rope or tackle for raising and lowering flags. The open ends of the heading are closed by hand stitching. The completed national emblem is again spread on a table, ends of thread cut off, and the final product inspected. If approved, the flag is folded and consigned to supply headquarters for disposition. Stars, contrary to the hand-fashioned articles of Betsy Ross, are manufactured of solid embroidery silk on a Swiss hand-embroider machine. The blue silk fields are placed in frames on this mechanism which is capable of producing a stitch not unlike hand embroidery—that is, both sides are alike. This machine, provided with numerous needles and threaded with white silk, perforates the field, back and forth, thus shaping the embroidery stitch. Not unlike the operation of a pantograph—a device for copying maps and plans on a predetermined scale—the operator of this embroidering device follows the lines on a pattern which is six times the real size of the design being fashioned. The needles make the corresponding stitches on the field.

The field and the short stripes are then sewed together and the two united to the long stripes by means of a one-eighth-inch seam, which may be effected either by hand or a double-needle sewing machine. The color is supplied with a yellow silk knotted fringe, securely stitched on three sides with a single-needle sewing machine. A casing is provided by turning over and stitching by machine that portion of the color at the staff end to a width ample to accommodate the staff. The casing is lined and a leather fastener provided at each end as a means of folding the color in correct position on the staff.

National colors are carried by unmounted troops, and standards by mounted military units. The inconsequential distinction between the two is that the standards are not so large as the national colors and do not possess cords and tassels. The national colors are four feet, four inches hoist, and five feet, six inches fly, the field of the flag measuring 30 inches in length. Once the silk for the stripes and field is inspected, it is fashioned to correct dimensions by use of shears. The short and long red and white stripes are united alternately by means of a neatly executed hand stitch, forming a one-eighth-inch seam. If manufactured in quantity production, however, this stitching may be performed by a double-needle machine.

Each unmounted organization is supplied with a regimental color of like dimensions as the national color. Similarly, mounted organizations share in the distribution of regimental and national standards of the same dimensions. Such banners are fashioned of heavy taffeta silk; in the center of the design there is embroidered by hand an eagle bearing similarity to that on the official coat of arms of the United States. Likewise, the coat of arms of the particular organization is embroidered on the shield. The crest goes above the eagle's head, and the motto on the scroll in the eagle's beak. Coat of arms, crest, and motto are distinctive for each unit. Immediately below the coat of arms, the official designation of the organization is embroidered on a scroll.

Silk for these banners is woven according to specified width, and the workmanship is in the absence of seams. Subsequent to inspection of the silk, it is cut to the proper length, and the design subject to embroidery, stenciled on the silk. A perforated pattern is employed for this purpose. The marking is of a durable nature since the design is traced with a specially prepared paint. The silk is then stitched in an embroidery frame and made taut. The different shades of silk thread employed in embroidering each banner approximate 30 in number, a variety suggesting that the seamstress exercise rare judgment to insure a proper blending of the finished product. Moreover, exceptional skill in manipulating the needle is essential since the embroidery stitch on both sides of the banner should harmonize. Both hands and two thimbles are necessary in the execution of such difficult embroidery work. The stitches in each design mount into the thousands and an experienced seamstress consumes 30 days in embroidering a regimental color and 20 days in fingering to completion a regimental standard.

Scrolls containing the official designation of the organization are embroidered separately and then put on the banner with an embroidered edging circling the entire scroll. This manner of fashioning the product makes it possible to read the identity of the unit from either side of the scroll.

THE LIBRARY OF THE UNIV OF ILLINOIS URBANA ILL

BRIEFLY TOLD

Sherwood Forest, the haunt of Robin Hood, is to be destroyed to supply coal. It is estimated 10,000,000 tons a year can be mined in the historical region of Nottingham County. Edwinstow Hall, the ancient mission, is to be turned into an educational center for the miners. The historic forest is owned by lords who are poor and harassed by the income tax.

There is a lake of Epsom salts near Basque, British Columbia. The lake lies on a plateau and is not affected by spring freshets or melting snow. The impregnated water bubbles up from a dozen springs and apparently the lake is inexhaustible. The product is taken out in four-inch sheets which are dried and pulverized.

What apparently are ancient stone gears, probably used hundreds of years ago by Indians who inhabited California near Santa Monica, have been found. The gears were about two feet apart and were uncovered fifteen feet below the surface. One was four inches in diameter and had several teeth neatly cut and smoothed and it is believed that the wheels were part of a machine invented by the Indians for grinding corn.

The Supreme Court was told during argument recently that the vaudeville business was controlled so completely by the B. F. Keith Vaudeville Exchange, the Orpheum Circuit Incorporated and similar agencies that an actor, author or producer could not succeed unless he subscribed to their direction.

Depredations of beaver in the Adirondacks region of New York have made necessary a law providing that the Conservation Commission be authorized to regulate the taking of beaver, in traps only, between March 1 and March 31. At one time the beaver was extinct in New York. A few were obtained and since then these forest rodents have multiplied so rapidly and have cut down so many trees and flooded so much territory that they have rendered valueless many large tracts of forest and farm land.

A remarkable fossil of the ginkgo leaf, the estimated age of which is 1,000,000 years, was found recently in Spokane, Washington. But one species of ginkgo is to be found in this day in China and Japan. It is also known as the maidenhair fern tree.

While the Osage Indians of Oklahoma are idly wallowing in the inherited wealth of oil lands, the Blackfeet tribe of Glacier National Park reservation today has achieved a reputation for thrift that brings to its 3,000 members high compliments from the Indian Department. So much wheat was raised last year by these Indians that the government built them a $65,000 gristmill to grind their grain for them. This is the first time in the history of United States civilization of the Indian that a tribe has become self-supporting through its own thrift.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The early Romans were the first glass makers of England.

The ship used by Captain Robert Falcon Scott on his South Polar trip of 1901-04 has been purchased by the British Government for a scientific expedition to trace the migration, numbers and rate of reproduction of whales in the Antarctic. In 1912, on another expedition, Captain Scott reached the South Pole by the longest continuous sledge journey (1,842 miles) ever made in the polar regions. He reached the pole January 18, 1912, five weeks later than Amundsen. He found Amundsen's Norwegian flag, tent, and so on, and carried away a photograph and notes regarding these.

In the modern hospitals when a baby is born a print of the child's foot is taken and on the same paper the thumb-print of the mother, for identification. It is claimed many mothers fear hospital accouchement lest the nurses "mix those babies up."

Hiring out as a Wisconsin farm hand, the son of the German ambassador to the United States proves himself a real dirt farmer. He spent a semester at the University of Wisconsin but left to work on a small farm located two and a half miles southwest of Madison. He is extremely energetic and is able to do all kinds of farm work.

When the oil boom hit the town of Smackover, Arkansas, the Postmaster-General at Washington received the following message from the postmaster who had grown wealthy in oil lands: "Office is out of my control; letters arriving 5,000 to 7,000 daily; parcel post by the ton; can't open mail any longer; no place to put it; accept resignation."

Eleven species of birds have been wiped out entirely in this country during the past 50 years.

An aviator glided 25 miles against a forty-nine-mile wind, with his motor developing less than fifteen horse power. Twenty-five horse power had previously been required to maintain the plane in the air. The test was made between Washington, D. C., and Dayton, Ohio, in a Sperry messenger, the smallest ship ever flown successfully. The aviator estimated that he gained 30 miles an hour by patterning his flight after buzzards observed on the trip in taking advantage of air currents.

Babe Ruth's salary is $4,333 a month.

The walnut in Bulgaria is almost indispensable to the housewife. The nut is eaten in the raw state and used for producing a cooking oil. The meats are salted, fried in a pan and then pressed with a rolling pin. Jam is made from the green walnuts and large quantities are used in the production of a very potent brandy.

Eleven daily newspapers are published in Rome, Italy.

While steaming in battle formation in the Gulf of Panama the United States battleship *Arizona* struck a whale head on. So vicious was the encounter that the whale was cut practically in two on the prow of the warship. It was necessary to halt the ship's engines while a wrecking crew disengaged the carcass.

Rear Admiral William S. Sims, retired, is quoted as follows: "The appointment of an officer who is not a graduate of the war college to be commander-in-chief of the great United States fleet is a crime against the people of this country. More than half the officers given preference in the transfers recently announced to take effect this summer are not graduates of the war college." The war college gives the officers training in the application of those doctrines which enable widely separated elements of a great fleet to co-operate as a single team and which enable the commander to make sound tactical decisions in time—that is, before the enemy can seize the initiative.

The premier of Bulgaria, M. Stamboulisky, proposes that wherever ten or more Communists are discovered in a peasant village, they shall be compelled to pool their resources and enter upon an experiment in communistic life.

"Usurer Has to Go," Says Oxford Don

Scientist Derives Economic Ideas From the Principles of the Heat Engine

By JOHN BASIL BARNHILL

PROFESSOR FREDERICK SODDY, one of the most distinguished and certainly one of the bravest of British scientists, lately astonished the scientific world by coming out for the absolute abolition of interest as the only alternative to the destruction of civilization. A consideration of the laws of the physical universe compels that conclusion, in his opinion.

The British "Who's Who" gives the following information in regard to Professor Soddy:

"Fellow Royal Society; Professor of Inorganic and Physical Chemistry, at Oxford, 1919; Lecturer on Physical Chemistry and Radioactivity, University Glasgow, 1904-14; Professor of Chemistry, University of Aberdeen, 1914-19; author of *Matter and Energy, Science and Life, Interpretation of Radium* and other works."

The following extracts from a recent lecture by Professor Soddy will indicate the departure from orthodox economics and orthodox science taken by him in his sweeping denunciation and utter rejection of interest:

All forms of energy previously utilized by life, with one or two minor exceptions, as tidal energy and that of hot springs, were forms of the solar revenue . . . . When coal became king the sunlight of a hundred million years ago added itself to that of today and by it was built a civilization such as the world had never seen.

The fundamental fact underlying this civilization is that while men can lighten their external labors by the aid of fuel-fed machinery, they can feed their internal fires only with new sunshine and then only through the good offices of the plant. In spite of the striking advances of the past century, the agriculturist, peasant and farm-laborer form the dominant economic class, and will remain so until some new discovery of science deposes them. To my mind this is one of the least obvious and yet most fundamental facts of economics and social science at the present time.

Physical science thus answers precisely, and I think for the first time, *the* problem of political economy, "What are the sources of our society's wealth; that is, the means of subsistence and comforts of the individuals comprising it?" The means of subsistence are derived from the daily revenue of solar energy, through the operations of agriculture. The accessories of life, clothes, houses and fuel, as well as its comforts and luxuries, are derived in great part by the augmentation of this revenue out of a capital store of energy preserved from bygone geological times. Life depends from instant to instant on a continuous flow of energy, and hence wealth, the enabling requisite of life, partakes of the character of a flow rather than a store.

Money and Wealth

THE wealth of a community can be increased only by production and discovery, not by acquisition and exchange . . . . Although my views are very similar in some respects to those arrived at long ago by Ruskin, I have deduced them, without at the time being aware of Ruskin's writings on this subject, from the principles of the heat-engine, rather than from those of ethics. . . .

There is much making of money but no making of wealth by exchange . . . .

The "economists" confound debt with wealth.

A ham merchant, working on what he is pleased to call a ten per cent basis of profit, may buy ten hams for the same sum as he sells nine. He may be pleased to think that he has made a profit of one ham, but he certainly has not made a ham. There were and remain ten, whereas if anyone had made a profit of one ham, there should now be eleven. These hams represent the lifetime profit of two and one-half pigs, fed, according to nursery tradition, on the skins of potatoes, which in turn derived their feeding value from the sunshine.

The material and scientific greatness of our day is due to the primitive accumulation of the solar energy of the forests of the carboniferous era, and preserved to this day as coal. The plant accumulated we *spend.* When coal is burned it is burned. You cannot both burn it and keep it in the cellar, and still less can you go on drawing interest from it forever at so much per cent, as is the case with the so-called capital of the economist and the business world. Here again the economist is mistaking our old friend, debt, for wealth. The wealth has been spent, not saved, and exchanged for some form of receipt, giving the holder a purely conventional right to so much per cent per annum until the debt is paid.

The capitalist wishes to have it both ways, to be regarded as a public benefactor because he spends his wealth, not in drinking himself to death, but in enterprises designed to increase the revenue. If he did this he would indeed be a public benefactor. But the community having spent his wealth, as regards himself, he expects it all back in due course with interest on the loan. The consequences of his abstinence are that civilization has got inextricably "into the hands of the Jews." Compared with this, the wildest profligacy on the part of the original capitalist would have been a relatively minor evil.

To Aristotle a usurer was a person beneath contempt. Today, even the vice-chancellors of the ancient universities, which purport to hold up to reverence Greek thought and culture, are as enamored as anyone of the excellence of compound interest. Of all hard critics of the usurer, Martin Luther is easily first, and in his vigorous denunciation there is a certain perspicuity which we moderns seem to lack. Otherwise few could tolerate the economics of an ordinary daily newspaper or social club. Thus Luther wrote:

"The heathen were able by the light of reason to conclude that a usurer is a double-dyed thief and murderer. We Christians, however, hold them in such honor that we fairly worship them for the sake of their money . . . .Usury is a great huge monster, like a were-wolf, who lays waste all, more than any Cacus . . . . For Cacus means the villain that is a pious usurer and steals and robs and eats everything, and will not own that he has done it and thinks no one will find him out, because the oxen drawn backward into his den make it seem from their footsteps that they have been let out. So the usurer would deceive the world as though he were of use and gave the world oxen while he however rends and eats all alone."

One must admit that it would be difficult to find a better description of usurer than is given here; "Oxen drawn back into the den which, from their footsteps appear to have been let out." Current orthodox economics gives the credit that rightly belongs to the scientific discoverer, the expander of wealth, to the usurer, the expander of debt.

The normal form of capital is simple debt, a permanent lien upon the future revenue of wealth. The assets are much overrated . . . . The vast heritage of wealth which science made available at the commencement of the nineteenth century, *in so far as it has been spent, has been replaced by paper receipts for the expenditure which bears interest in perpetuity.* Such capital merely means unearned income divided by the rate of interest and multiplied by 100. If I invent a process bringing in a thousand pounds a year revenue, its capital value is twenty thousand pounds if the rate of interest is five per cent, and I can sell it for some such sum. The capital of the world in this sense today aggregates to an altogether inconceivable sum. *There has never existed at one time such an amount of wealth.* It represents the accumulated capital expenditure of generations of men.

During the war the capital of England was *increased* by thirty-five billion pounds, which brings in three hundred and fifty million pounds a year permanent interest. I may be told that every one will admit that this is debt, whereas it is in fact, in this respect, precisely, on the same footing as so-called productive capital expenditure, a private lien upon the revenue, *wealth* to the individual owner and *debt* to the community. As regards the national accounts, this interest is a simple transference, rather than an item of expenditure. It is collected from the taxpayer and paid to the holder of war securities. It amounts to more than eight and one-half pounds per head of population, and includes the small item of ten shillings per head in respect of the Napoleonic wars.

There can be only one possible end to this process. Though for a time the advances of science may so increase the revenue from year to year as to render these payments by way of interest possible, **in the end the whole of the revenue must be in the control of the usurer.** A small part of the population will get into the position of a great rentier class living on interest, and most of the rest will be reduced to starvation in so far as they are not kept alive by state doles.

How far this process has already progressed in England is obvious, since something like a quarter of the population at the present time is unemployed and *the expenditure on national education is only a quarter as much as that upon the holders of war securities.*

The Meter on Wealth

THE river of wealth is divided, but a part is metered carefully and recorded as an accumulation of capital indebtedness against the community. Scientific men, in the innocence of their hearts and the benevolence of their souls, fondly imagine that by increasing the revenue available for life they benefit the community. But do they? The larger the revenue, and the greater the flow above that required for immediate consumption, the greater the debts incurred by the community and the impossibility of their ever being repaid. Meantime, though real wealth rots if stored, the meter readings spontaneously bear interest and increase *ad infinitum.* The principles and ethics of human conduct and convention have their own code and standards, but whatever they may be, they must conform to and not run counter to the principles of thermodynamics. A chauffeur may have a soul above the mechanism of his car, but if it led him to try to run the car on already consumed petrol, he would be considered a great ass.

It is remarkable how people, who never came up against reality from the cradle to the grave, and live all their lives a purely artificial existence in some city, divorced from all contact with primitive nature, get into the habit of supposing that the conventions which regulate their businesses and livelihoods can be applied to the economy of the world at large. It would be quite impossible for any member of the agricultural community, for example, accustomed to the ways in which wealth is really produced, to fall down and worship the institution of usury in such a naïve fashion, or for a labor government to be guilty of the confusions between wealth and debt which are characteristic of orthodox politicians at the present time. We have in the function of government as administered almost entirely by those who live by rent, interest, and profit, and thus take from rather than contribute to the revenue of the wealth of the community, a further justification for the view already expressed, that the community in its struggle for existence resembles an army officered almost entirely by the enemy.

You cannot permanently put an absurd human convention, such as the spontaneous increment of debt, against the natural law of the spontaneous decrement of wealth. This applies whether it is simple or compound interest which regulates the increment of debt. For obvious reasons the law of compound interest over great periods of time rarely as yet has fully operated. But the significant and distressing fact is that this absurd law, with the concentration of money in the hands of trusts and combines of financiers, now tends to operate more and more fully every day.

Some of you may have heard of the story of the reward asked of the Emperor of China by the man who taught him chess. It looked modest enough. He wanted one grain of corn for the first square of the chess-board, two for the second, four for the third, eight for the fourth, and so on in a geometrical progression to the sixty-fourth square. Before three-quarters of the board had been dealt with, the Emperor had to cry off, as his couriers came back to him reporting that there was not such a quantity of corn (actually twenty-three million tons) in the empire. At the sixty-fourth square the reckoning would have called for one million million tons—more than the present population of the world would consume in a period of time longer than that covered by the records of history.

This is the law of compound interest. Today one pound of debt doubles itself in about 12.5 years, and becomes 1,024 pounds in 125 years and more than a million pounds in 250 years at 5.5 per cent compound interest. If this is to be the inevitable consequence of scientific men increasing the wealth of the world, enthusiasm in well-doing may well dry up. Nevertheless, on no other terms than a perpetual increase of the revenue by scientific discovery can such a system of "economics" be maintained, and, even so, were the twentieth century as prolific in discovery as the nineteenth, there is no escape for it from ruin under the law of usury and the rule of the usurer.

"Its Inevitable End"

LET us, in the light of the analysis of wealth and wealth production which has been attempted, consider the aspect of this mad system which is now uppermost in the minds of many thoughtful people, *its inevitable end in world war.* Remember that it is impossible to save. The revenue of wealth must be spent as it accrues, either in consumption or in capital expenditure. The latter is for the purpose of securing a lien on the future revenue, by producing more goods or services out of which a profit can be made. But as the masses do not receive the profit, they cannot buy this increased production . . . . Man power is now cheapened by being pitted against the infinitely greater and more docile power of inanimate nature. For a brief period which is now closing, though only after terrible hardship and suffering, the displaced labor found an outlet ultimately by reason of the increased fraction of the revenue devoted to capital expenditure. But the world fills up. Its markets, at first open to the excess production of the industrialized nations in exchange for food, tend to close as time goes on. The fiercest international rivalry for markets ensues, and to industrialized nations armaments are, as products of *machino-facture,* the one thing that can be turned out in almost limitless abundance. But armaments and war do not produce food. They merely determine the distribution as between competing nations, and tend to destroy food-producing power to an extent that makes even the victors actual losers. In this Ruskin was again ahead of his own times. He alone seems to have had sufficient veracity of thought and power of penetrating below the conventions of society to realize that, in the pursuit of gain, the objective was illusory in a physical sense. Ruskin writes:

"Capital is a root which does not enter into the vital function till it produces fruit. Capital producing nothing but capital is root producing root, bulb issuing in bulb, never in tulip. The political economy of Europe has hitherto devoted itself to the multiplication of bulbs. It never saw or conceived such a thing as a tulip."

I do not pretend to be able to have got further in my own conclusions than this, *that the rule of the usurer in political and social affairs has become impossible and that he has to go.* At a time like the present, when the usurers of the world, if cheated of their expectations, like Shylock are bent on a pound of flesh next to the heart, their pretentiousness and futility are obvious, and some form of government according to economic, rather than chrematistic, principles will have to be resumed.

The laws of energy under which men live furnish an intellectual foundation for sociology and economics, and make crystal clear some of the chief causes of failure not only of our own but, I think, also, of every preceding great civilization. They do not give the whole truth, but, in so far as they are correct to physics and chemistry, they cannot possibly be false. I think with but little amplification and modification they might furnish a common scientific starting point from which all men concerned with the public rather than with their own private interests might start to rebuild the world more in conformity with the great intellectual achievements which have distinguished the present age.

The first step toward such a scientific Utopia would be the due delimitation of the rights of the community's creditors—THE CURBING OF THE DEMON OF DEBT WHICH MASQUERADES AMONG THE IGNORANT AS WEALTH.

This teaching is in line with the wisdom of Edmund Burke who, with characteristic profundity and humanity, wrote:

"IT IS TO THE PROPERTY OF THE CITIZEN AND NOT TO THE DEMAND OF THE CREDITOR OF THE STATE THAT THE ORIGINAL FAITH OF SOCIETY IS PLEDGED. THE CLAIM OF THE CITIZEN IS PRIOR IN TIME, PARAMOUNT IN TITLE, SUPERIOR IN EQUITY."

A Stream of Defective Immigrants Taints American Life

Commissioner at Ellis Island Bares Influence of Politicians, Lobbyists and Congressmen in Introducing Feeble-minded Aliens

By CHARLES ALBERT COLLMAN

THE recent bold spiriting away of a defective immigrant in Syracuse, New York, after a deportation order had been issued against him, has again centered attention on evils of the immigration problem. It is significant that these continue to persist in defiance of quota limitations and personal restrictions.

Figures tell only part of the story. But it appears that nearly 20,000 defective aliens entered the United States last year, of whom about 15,000 were admitted under no restrictions at all, while some 5,000 sufferers from diseases or disabilities were entered under the conditional restraint of a bond. Some of these cases were of so incurable a nature, that it was inevitable that the victims should become inmates of publicly supported institutions.

Now official records of the Bureau of Immigration show that in the past, 95 per cent of the immigrants admitted temporarily or under bond ultimately violated and forfeited their bonds and remained in this country. In other words, not five per cent of the bonds of defective immigrants have ever been enforced. Furthermore, investigations have shown that it has been a usual practice for bonded aliens to give incorrect names, for them to leave the cities or states in which they had agreed to reside, and that, in fact, they have violated at will the terms of the bonds which were to govern their conduct.

Much may be said on behalf of the foreign-born friends and relatives of immigrants who are deficient mentally or disabled physically, in their efforts to provide new homes for their distressed kinsfolk. To Americans, however, such efforts mean the introduction of a strain that threatens to undermine their well-being.

It is remarkable to observe—and such observations are substantiated by data of the Bureau of Immigration—that a singular number of attorneys, lobbyists, politicians and Congressmen, for purposes of profit or other self-interest, are constantly exercising pressure on the Department of Labor, not only that there may be laxity in the enforcement of the immigration laws, but also that individual immigrants may be admitted in spite of the law or the best interests of the country.

The Pressure in Washington

SUCH pressure is being exerted by friends of deportable aliens through political leaders in Congress who have large foreign-born constituencies—those most active in this propaganda being from New York, Chicago and Boston. Senators and Representatives of this type deliberately bring threats or persuasions to bear upon State and Federal authorities charged with the deportation and debarment of aliens. It is a patent fact also, that in Washington there are to be found rings of immigrant aid societies and groups of their attorneys whose efforts are devoted toward the interests of excludable immigrants. One immigrant aid society is represented by an adroit attorney to whom it pays a retaining fee of $15,000 a year.

Representative John L. Cable, of Ohio, after having studied conditions at Ellis Island, last December, on the floor of the House, endorsed the administration of Immigration Commissioner Robert E. Tod in the following words:

> The effectiveness of the work at Ellis Island is one of the chief factors in determining our country's future. The admission of mentally, morally or physically unfit into this country, even in small numbers, would, in the future, weaken our nation and place a huge burden upon generations to come. Millions of dollars each year must now be raised by the various states for the maintenance of foreigners heretofore admitted and now confined in state institutions. The Commissioner of Immigration, Robert E. Tod, was persuaded through patriotism to accept that position. Upon accepting the appointment, he went abroad at his own expense and studied immigration conditions in Europe, and from investigations I made at Ellis Island, I find there is no one devoting so much work and effort for the good of that service.

It is undeniably true that Commissioner Tod has come out courageously in exposing the influences that are so unscrupulously active in tainting the American population with a flood of defective life. As far as his attitude is concerned, it has apparently been received with approval by the public. Every mail brings to his office letters of commendation from editors, clubs, and representative people in every walk in life, urging him to continue and promising him their support. He has been besought not only to deliver speeches on the subject, but has been urged to make public the names of the Congressmen who, after having been elected by the people to pass laws to protect the United States, do not hesitate to bring pressure on officer who were appointed to administer the laws, in efforts to let in undesirables or to keep them here.

"The whole stream of American life should not be permitted to be polluted," was Commissioner Tod's comment, when I recently visited him at his offices on Ellis Island. "I am interested in the welfare of America and the future of this country, and this country has no place for feeble-minded aliens. I am working harder now than at any time in my life," he added, with a laugh—"harder than when as a banker I worked to make money. But I intend to stick it out and keep on with my efforts. I was not exactly anxious to get into this work, but was asked by President Harding to take it up, and being once in it, I'm going to see it through. I have been here now about 18 months—since my return from Warsaw.

"The law is going to be administered here in absolute accordance with the work of Congress in placing it on the statute books, and in the administration of it I have been assured by the Secretary of Labor, his two assistants, and the Commissioner-General, that I shall have their warm support and co-operation. I intend to guard the privileges of immigrants as assiduously as I do the rights of the United States. This country does not need new immigration laws so much as it needs the honest administration of the laws already on the statute books and the protection of honest officials from vilification and irresponsible attacks from irresponsible persons."

Mr. Tod then gave me certain examples of individual cases which exemplify better than generalities the studied efforts that are being made constantly to thwart the law. They concern mostly feeble-minded and other excludable cases, which should never have been admitted in bond in the first place. Once admitted wrongfully, however, their illegality has been renewed and re-renewed. Whenever attempts are made to deport such aliens, there are strange reversals of decisions, which result in a constant succession of orders of "Deport" being changed to "Stay deportation"; of orders from "Bond" to "Deport" and back once more to "Bond."

"The law," said Mr. Tod, "explicitly states that the mentally deficient alien has no right to appeal to the Secretary in Washington, his admission resting with the decision of a board based upon medical certificate. He can appeal from a decision and have a re-examination with one medical expert present. This applies only to arriving aliens, and the law certainly is not intended to apply to endless chains of examinations and re-examinations. The decision of the Board of Public Health Surgeons, which has no reason to be prejudiced against the alien, better preserves the rights and protects the interests of the United States than the opinion of an expert paid by the immigrant, whose inclinations are naturally in the direction of the person who pays his fee. The practice of declining to take opinions of psychiatrists at this station, compelling them over and over again to make examinations, is an insult to their intelligence and professional knowledge, and is bitterly resented here."

Take the Sas Case

IN CASES of aliens who have been admitted on bond, it is only their contempt for the law that forces the government to take action forcibly to eject them from the country. According to the commissioner, the most flagrant instance of this sort that came to his attention was that of the Sas family. For calm defiance and contempt of the immigration laws it would be difficult to find its parallel.

"If ever there was a family," observed Commissioner Tod, "which the laws contemplated to keep out of this country, this was one."

A chronological summary of this case will best illustrate the methods adopted by the relatives of and counsel for these aliens.

On November 24, 1920, the Sas family arrived on the steamship *Olympic*. The father, 61 years old, was certified for inguinal hernia, the mother for chronic valvular disease of the heart, and the grandmother, Ryfka Fink, with senility and varicose veins. The two children, Melach, 10 years old, and Sara, 10 years old, were manifested as twins. These twins were certified as being feeble-minded.

But immediately when counsel appeared for these aliens, their ages and status were changed. It was now alleged that instead of being 61, the father was but 45. The twins, it was said, were not twins at all, nor were they ten years old. The commissioner comments that the testimony given under oath, if untrue, should have warranted a charge of perjury.

January 30, 1921, the Sas family were let in on bond.

ROBERT E. TOD

March 6, 1922—Farcical proceedings were conducted until this date, when the Board of Review rendered a memorandum, showing that the department was fully cognizant of the conflicting testimony that had been given, and recommending deportation in the event that the immigrants were again certified. Upon the age given for Sara, the Board of Medical Examiners withdrew the certificate for her, but again certified Melach, who, even to a lay person, presented an unusual appearance. Here is the sequence of defiance:

Uncle Sam's Might Scorned

APRIL 14, 1922—The bureau wrote that the deportation order had been stayed, that an investigation could be made concerning a report that the family had spent $3,000 or thereabouts for attorneys' fees.

May 15, 1922—The Department of Labor directed that they be deported.

June 1, 1922—*Bondsmen were ordered to produce them for deportation. They ignored the demand.*

June 16, 1922—A warrant of arrest was issued to force them to obey the law.

August 15, 1922—The farce was renewed, and another examination ordered with a medical expert present. Arrangements were made with the Chief Medical Officer at Ellis Island to convene the Board, and the bondsmen were notified to produce the aliens there on August 22.

August 19, 1922—The attorney in Pittsburgh requested that the date be changed to August 30 or 31. The aliens and their attorney were again catered to, but for the fourth time Melach was certified for feeble-mindedness. The bureau, in its certificates, stated that on close observation the boy, while having the physical development of a child of 7, had an old look to his face, like that of a boy of 12 to 14, which would have been his age according to the original testimony. There was a very strong suspicion that the children were dwarfs.

September 18, 1922—A warrant of deportation was issued, with instructions not to deport until December 1, being an additional favor granted to these clearly deportable aliens.

December 21, 1922—An order was issued that if agreeable to the Public Health Service, the alien, Melach, be granted a final examination before the Board of Public Health Surgeons, *composed of members who had not previously examined him.* Yet competent men at Ellis Island had examined this boy four times. It was directed that if again found to be feeble-minded, Melach's deportation should be effective by the first sailing.

February 13, 1923—The Pittsburgh office notified

The Court—Does It Matter?

IS IT, after all, a matter of Court or no Court, League or no League? Is that the vital question for whose settlement the mind of the country waits? Does anyone feel that, for or against, a settlement would bring any ease to the tension of the world? Is not everywhere the feeling something like this, that the matter was revived with political intent, and not with reference either to the duty of America or the need of Europe?

The people of this country were hungry and after many consultations the rulers gave them a stone of academic interest in foreign relations that have not yet become relations. If we are to assist Europe we must first find our own footing. We must settle our own difficulties. We must show our capacity to administer our own affairs. Then, perhaps, we may be able to play counselor to the world. Not that our joining the Court would give us this position of counselor. We have that, or as much as we want of it, now. It would do not one whit more than supply a small boom of thunder for the campaign. A campaign without issues approaches. It must have an issue!

The pity of it is not the proposal to enter the Court—because the Court is not the question at all. The pity is that having hundreds of pressing domestic problems on hand an Administration will admit its incompetence by turning to foreign problems for which it has neither aptitude nor ability.

To States Having Water Power

GOVERNORS, legislators and people of States possessing undeveloped water power should know of an attack which is being made upon the development of that water power. The attack is delivered under the pretense of conserving water power. The term "conservation" is one of the slogans of a past period, and there are people who still believe that "conservation" really means what it says. As a theory it was undoubtedly right. The people would not have approved it if it were not. But in practice the thing called "conservation" has worked out most shamefully and harmfully to the nation. The story of "conservation" is so bad that if told in its entirety the people would not believe it. The principle was excellent, but has issued only in costly administrative systems which have never accomplished what they promised.

Every State is justified in protecting the people's rights in their basic resources. Water power is one of these resources. In some States the protection has come too late. But in certain other States the authorities and people are alert to prevent the errors made elsewhere. It is to these latter States that this is addressed.

Let the awakened State take stock of itself and it will see that already the power trust has fastened upon it. It will discover within its own borders the presence of exploiting companies which are distinguished by two plain marks, namely, certain developed water power sites which are disposing of their power to industries and communities at exorbitant rates, and a larger or smaller number of water power sites which have been seized and held to prevent independent competition. By these two marks any State may know whether it has been invaded by the power trust.

Now ensues a situation which for ingenuity and danger can hardly be equaled in the power field. The power trust knows that honest industry is turning more and more to the use of water power, and the power trust knows that the industrial development of water power will show a decreased cost which must ultimately form an uncomfortable contrast to the charges now made to the public. The power trust also knows that, possibly, industrial water power activities may result in a surplus which could be delivered to the consuming public at a greatly lowered price. Therefore the power trust looks upon the possible industrial development of water power as a menace to their monopoly.

And here is what follows. The power companies instruct one of their attorneys to draw up a bill which will work upon the popular prejudice in favor of "conservation," such a bill providing that no water power sites shall be let to anybody for any purpose for a considerable length of time. Consider the situation—these power companies have all the sites they want, they have as a rule more than they have developed, and being well supplied themselves they seek to shut out competition by working on the people's well-known prejudice in favor of "conservation."

Such an instance occurred only recently in a northwestern state. The attorney of several companies which are interested in power monopoly drew up a bill forbidding the development of more water power sites in that State for a term of years. He had the bill presented to the legislature through an assemblyman with whom he was closely associated in politics.

So far it was all plain sailing. But the strategy of the power trust was not complete. The next thing they did was to send down corporation lobbyists to oppose the bill! The legislature was composed of honest men, and when they saw all the corporation lobbyists opposing the bill they thought to themselves, "Why, this must be a good bill for the people, if the corporations are against it." It was natural for them to think so, being honest men. They did not know of the motives behind it.

But even that was not all. Others besides corporation lobbyists opposed the bill. Honest manufacturers who wanted to develop their own power, thus to circumvent the high charges of the power companies and give the public the benefit in lower cost of the product, also went up to the legislature to protest. And they endured the ignominy of being confused with the corporation lobbyists. Indeed, the lobbyists were glad of the opportunity to be in such excellent company as the representatives of honest manufacturing enterprises, and they made the most of it saying, "See, all of us are against it"—which rendered it difficult for legislators to see at once the distinction between manufacturing uses of power and exploitation of power.

This is a situation of which all States should be apprised as early and as fully as possible. A trick worked by the trust in one State is sure as fate to appear in another State. From now on States may expect to see a most ardent interest in "conservation" exhibited in the most unlikely places. And to cover the source, the power trust's lobbyists will lobby against what they want, according to the rule of contraries. For, in alert States, legislatures are pretty well convinced by now that the interests of exploiting corporations and those of honest productive business and of the people are distinct and different.

Every effort should be made to safeguard the natural sources of power, and to prevent the grabbing of it for the greater oppression of the people who have to pay for it in the form of light or heat or power. That is the duty of the State. That is the desire of all good citizens.

But distinction should be made between the exploiter and the man who wishes to avoid the exploiter by developing his own water power for use. When a manufacturer wants to develop his own water power, what does it mean? It means, first, that he wants to escape the oppressive charges of the power trust which the public eventually pays in the greater cost of the manufactured article; and it means, second, that he wants to get his power cheaper in order to sell his product to the people cheaper. And if to do this he builds a factory by the water power site, he is making jobs for men, increasing the wealth of the community and putting industry on a sounder basis.

Every bill introduced by power companies under the thin guise of "conservation" is designed to stop the honest progressive manufacturer, and no one else. And there is no State in the Union that wants to stop the USE of power. Power is meant to be USED. Until it is USED, it is a total loss, it is utterly wasted. States should encourage the man who wants to USE power to do useful things. In this way States will make their most effective stroke against the exploiter.

Too Late

CONGRESS is not to be congratulated on its rising intention to look into the activity of that gentleman known as Albert D. Lasker. It is too late. Mr. Lasker has accomplished the thing he started out to do, and he accomplished it by keeping in a befuddled condition some of the men who should have been on his trail from the first. What exactly Mr. Lasker has accomplished will be laid before Congress and the public at the proper time, not that there is the slightest desire to penalize Mr. Lasker, who has simply followed his instincts, but because the exposure of the facts may help to rouse from their sleep those who have been called "the Gentile boobs" at Washington. Mr. Lasker has finished his program, set the currents of advantage in the directions he desires, and is now ready to step out. The Dearborn Independent has not the slightest desire to undo a single thing that he has done. Long may it stand to be rubbed under the noses of the sleepy crowd that let him get away with it.

The same applies to the newspapers. A large number of newspapers have suddenly become excited about Mr. Lasker. Mr. Lasker is no worse today than he was two years ago, but too many newspapermen dined and drank with Mr. Lasker for the truth to come out. And even now that they are aroused, the newspapers will not tell the whole truth about Mr. Lasker, nor all of the truth in their possession.

Questions Answered

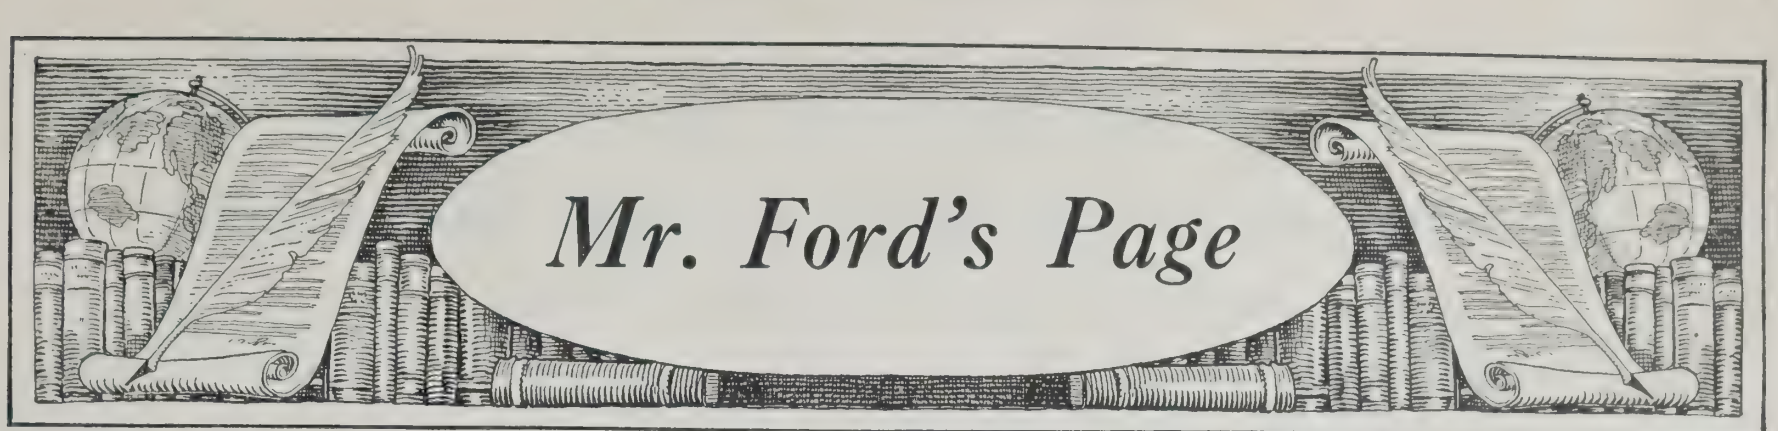
A SUBSCRIBER asks us to answer three questions. First, concerning the condition of law enforcement in this country. It becomes more and more a question whether laws are enforced or only their violation penalized. Putting law into force depends on the inner conviction and good will of the citizen more than on anything else. Officers cannot enforce the law. They may detect violations of it and arrest violators. It may be said that where people believe in the law and want the law they put it into force themselves, that is, they observe it in their conduct.

The second question concerns the failure of law enforcement. That there is failure no one can deny. But the failure is among those who do not believe in the law which they violate. Take prohibition, for example. People who believe in it observe it, many others do not. It is this law which our subscriber probably has in mind. He is probably thinking of the failure to force the prohibition law upon the observance of those who object to it. The failure to do this rests on two points, first, the authorities whose duty includes enforcement, do not themselves believe in the law; second, the number of officers required to make absolute enforcement would be so large that it would probably be equivalent to one-half of the country taking up police duty against the other half—a situation that is not likely to ensue. On the general question of enforcement, there is this to say: If the conscience or interest of the country were aroused, and if the dangers of law violation were apparent to the intelligence of the nation, there would be no difficulty at all about law enforcement. We had military conscription and forced bond sales when whole communities of people objected to it, but nevertheless the men were conscripted and the bonds were sold. The nation can do what it wants to do when its mind is made up.

The third question concerns suggestions for a remedy. There are as many suggestions as there are interested persons. The condition is not amenable to suggestion. It is working itself out and will thrust to the surface its own remedy.

More Ignorance, But Also More Brains

THIS year's Romanes lecturer at Oxford said that the young men of this generation are more ignorant than were the men of his own generation forty years ago, but that they are also more intelligent. If that is true, the result is gain instead of loss. Surely intelligence and not mere informedness is the ideal for the mind. We are acquainted through the fiction of forty years ago, and through biography, with the type of man who was very well educated and carried a number of different lines of information, mostly useless, at his finger tips, but there was always a question about his general intelligence. Much that we used to call knowledge has become attic accumulations. It was far too respectable to throw away, so there just seems to have arisen a generation that begins with intelligence and finds its own knowledge in those fields where its work will be found. The world can afford to endure a great deal of ignorance of what it once called knowledge, if in return it may have an excess of intelligence.



Mr. Ford's Page

THE people are now fairly alert to the currents and cross-currents that are being played upon their minds. They are sufficiently experienced by this time that no amount of manufactured propaganda on any subject will be permitted to drive them from their own base of knowledge which they have won by their own instinct and observation. It is a living knowledge that the people have, not mere say-so floated on the winds of hearsay. The people can be influenced wrongly only by being lured to forget what they already know; but as they always come back to their own base, they are not wrong for very long at a time.

The people of the United States, as well as the people of other countries (these latter to a greater extent than we realize) have kept themselves steadily aloof from plans which would consolidate this world under an international banking government. For international amity and assistance the whole world calls, and these have been promised most fulsomely by the very statesmen who are most amenable to international financial influence, but the people have heard silent warnings bidding them listen discreetly and hold their hand. There is no assurance anywhere in the world that the statesmen of the old regime are able, even if they were well-intentioned, to bring anything but further chaos out of the chaos they have already caused.

When you read the mind of the people of the United States—and the mind of our people is, as it were, our New Testament, of which the Old Testament is the Constitution of the United States—the one being good law and the other being high hope and glad gospel—what do you find in the mind of our people?

You find, first of all, a feeling that there are certain things to be done around home which are being neglected. Just what these things are you will discover by touching the people's interests in the various parts of the land. Everywhere there is a pressure, a feeling that the wheel is wabbling for lack of an experienced hand upon it.

The interest of the people is upon American questions. We have fought side by side with nations in war, we have fed them in famine, we have received their people by millions in times of peace, our prosperity has been felt in every corner of the globe and there is scarcely a tribe that has not somehow benefited by our service—so that we can hardly with fairness be described as insular or isolated or any of those things which the propagandists of International Finance are calling us. As a nation we are not cold to the rest of the world, but we feel that there is a way to help which is not yet acceptable to the real rulers of the Old World, and that in the meantime we might as well be getting our own house in order. There are things to be done in the United States and the people have an uneasy feeling that foreign affairs may be made an excuse for domestic incompetency. Everything begins at home. If we lack there, we lack everywhere.

IF OUR officials feel that they are able to go over and straighten out Europe, what can they do for the United States? Usefulness should begin at home. This country has a number of problems to solve and it does not look well to run away from them nor to obscure them with a smoke-screen of foreign politics. A swing around the country would reveal that nearly every section has a serious, unnecessary and unjust burden to carry. Not merely a political dissatisfaction, a partisan prejudice nor a conversational grouch, but a daily painful burden originating in some form of government action or neglect of action—and nothing is being done about it. While Europe is getting into the shape where it will accept the only kind of help that will really help it, our officials should keep their hand in by doing something for the United States.

It is not an answer to the people that here we have plenty of employment and a measure of prosperity, for it seems to be in the back of their minds that a country which can do so well in the regions of private business ought to be equally able in the regions of public business, and it is their opinion that most of the present drawbacks are due to the incapacity in public business.

They feel that a Government which pretends to be able to straighten out Europe ought to be able to do some very much needed things for the United States.

In one section of the country you will find people actually burdened and impoverished by the railroad situation. Now to most of us the railroad question is purely academic. It is something we read about and discuss for the purposes of conversation. It does not actually hurt us; we do not feel it as an hourly pressure. But there are parts of the country where the farmer cannot charge the railroad rates back upon the public, he pays them himself, and after he has paid the railroad he has little left. In fact, railroads get more for carrying farm products a short distance in a few hours than the farmer gets all year for raising them. Why? Because the Government passed a law permitting railroad rates to be based on valuations of the roads, and the "valuations" included every speculative burden that could be counted in. The people were compelled by law to pay for what did not exist. Any gambler can make a $10,000 house cost $100,000, but to compel a tenant to pay on the basis of $100,000 would be sheer injustice. Well, that kind of injustice is a daily burden for hundreds of thousands of the best citizens we have, and who is doing anything about it?

You go to another section of the country and you will find an undeveloped empire whose inhabitants pray for someone to come along and do something to open it up. This particular section has been deliberately discriminated against. It has been humiliated and made to feel that it is worthless. After asking that someone do something about it, the Government holds up all offers. In that empire the people of the United States have the opportunity to make themselves forever nationally and economically secure, and to demonstrate on the largest possible scale that life may still be had on decent terms by the intelligent use of our country's natural resources. Yet nothing is met here but obstructionism. The perfection of these United States does not seem to be the objective at all—nothing is done about it.

The people of this country feel that certain things are waiting to be done which the mind and conscience of the people demand to be done. But the means for doing are lacking. Yet the mind and conscience of the people are supposed to be the law. Still no way exists to get the law in force. If there was in Washington a sense of fellowship with the people of the country, an understanding of their problems and a sympathy with their patience and good will, we should see something come to pass. But sometimes Washington seems as if it had never heard of the plain people of the country—except at election time. Even at election time, it is not the common people who are counseled with, but the party bosses who seem to be able to "vote" the people as desired.

It has come to the point where Government has become just one department in the people's life, although claiming to exercise jurisdiction in all departments. But as the claim has not been accompanied by able exercise, it has lost its prestige. People are coming to think of the Government as being an exalted bureaucracy having to do with the army and navy and customs, and not able to do anything more. And yet the people know that Government must be able to do more when the necessity arises. And as necessity after necessity has arisen in this country recently, and the inability of Government to help has become more and more apparent, there have come to the people's mind thoughts of an expansion of the usefulness of Government by demanding higher and more varied ability in its personnel.

There is little doubt that the people who compose the Government would gladly do more and better—if they only knew how. But how can it be expected of them when they have spent their lives as orators, politicians, job-holders, bond-brokers and society favorites? Are these the activities which train men to real public service? They are not.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Let Us Ask Them to Pronounce "Shibboleth"

We Speak of the New Parasites With Which America Suffers

By LEWIS WORTHINGTON SMITH

A NEW body of parasites is finding a foothold in America. There have been predatory classes with us before, no doubt. At one time the slaveholders were included in that group. Later the captains of industry were given the doubtful honor of popular election to that fellowship. Whether they were entitled to that distinction or not, they were angels in comparison with some of the parasites of today. Whatever else they did, they worked. They produced something, and they helped others to produce. They did their part in organizing life and directing it in ways of fruitful activities. If they preyed upon society at all, it was only, at the worst, in taking more than their share of what they and those whom they directed jointly produced.

The founders of America, those who gave the decisive bent to American life, were not parasites. They believed in work. The new parasites have a horror of work that is both theoretical and instinctive. As cultivated men, they hold that work is not their province. It is their field, as they understand it, to prey upon the emotional susceptibilities of women, upon the generosities of the prosperous, upon the vulnerabilities of the high-minded and the great. In pursuit of this natural aim and end of being, they feel that they must devote their devitalized energies to the business of eliminating marriage contracts for all the emancipated. Extending their survey of the human material upon which parasites may prey, they discover that artists and intellectuals of all sorts should satisfy the cravings of what they understand as their higher natures. They were created so to be independent of the limitations imposed upon ordinary men and, rejoicingly and triumphantly, to live as they please.

Believe in Parasitism

WHETHER some other individual man or individual woman or society at large pays the bill for this predatory license of theirs is to them not a matter of moment. All that they care about is that the bill shall not be presented to them. It is not in agreement with parasitic doctrine for them to be asked to write their acceptances across it. That doctrine not only sets them free of all petty obligations, but also encourages them to believe that newly imported continental immigrants should take the best holdings of the Anglo-Saxon, for the obvious reason that here in the New World the Anglo-Saxon, having come first, has the best holdings. It is a further justification of that faith that they know very well that the Anglo-Saxon is able to build a new roof over his head more easily than the incoming parasite. He should therefore be ready to surrender his homestead. Moreover, he should learn that the parasite is a fine exotic flower, something for him to rejoice in, whatever the cost. Look at us and judge for yourselves, say the presumptuaries, expounding their doctrine—Harold Stearns, Theodore Dreiser, George Jean Nathan, Floyd Dell, Ludwig Lewisohn, and all the others.

We must not forget all the others. They are obsessed by the confident belief that parasitism is a charming and infallible provision for the maintenance of the elect at the expense of the common Anglo-Norman in America. So confident are they, partly by reason of their increasing numbers, that they are beginning to rely on the use of clubs. It is time, they are sure, for the American to discover that orchids are necessary for the development of any civilization assuming to stand comparison with the civilization of Germany or Russia. It is their purpose, beneficent and almost charitable, to teach us how to grow orchids. Then they will themselves be the orchids. That is their manifest destiny. They have found evidence of so much reposing modestly in the inner recesses of their own spiritual natures. An orchid certainly knows the difference between itself and a sunflower, or should. It knows better than to push its roots down into black soil not enriched by the decay of some plant life upon which it may in part feed. Following the example of luxuriant beauty, these outlanders of the spirit are happy in being parasites. Where could parasites flourish more magnificently, they ask themselves, than in prosperous America? From whom could they suck nourishment better than from the people who have conquered a continent?

Refuse to Pay Their Debts

THE parasite is wise in his day and generation. It seems probable, however, that his generation is swift and his day short. At the very longest calculation it is very much shorter than that of the Anglo-Norman. There are reasons for that, not only in the reaction of the world to the parasite and his activities, but in his inner character itself.

It is worth while asking ourselves what it is to be a parasite. There is more than one understanding of the term, and a proper definition of terms is always desirable. As a matter of the cult of beauty, it will no doubt be somewhat generally accepted that too much work, too much worry, too much slavery to the material details of existence may easily rob the most glowing of human presences of its charm. To be a parasite, from one point of view, is merely to escape all this, to be beautiful and to insist on living under conditions that make the preservation of beauty possible. That is the positive face of parasitism, and it is not altogether unlovely.

The other face is different. To be a parasite, from the second point of view, is to refuse to be a creative or productive energy. It is to refuse to pay one's debts to the totality of existence. Probably most of us will and must refuse to think very much about the totality of existence. It is rather comprehensive, and thinking about it and our relations to it involves, no doubt, the acceptance of some considerable intellectual burden. None the less we are social beings, as far as we are fully members of the human race. As social beings it is impossible for us to escape our relations, almost impossible to escape thinking about them, even though our thoughts touch the totality of existence but lightly.

One among those of our relations that the young radical seems most anxious to escape is *our relation to the past.* In the chapter on "Scholarship and Criticism," in "Civilization in the United States," the author, a writer who deserves better companionship than this volume affords him, says, "Under all the great works of culture there broods the quivering soul of tradition, a burden sometimes disturbing and heavy to bear, but more often helping the soul to soar on wings not of its own making." This is an honest recognition of an elemental fact. If we soar at all, and if our soaring is at all according to current modes, it is almost always on wings not of our own making. That is the basis of our debt to the past. The literary parasite of the present wishes to soar on these wings not of his own making, and at the same time he denies any allegiance to tradition. Doing that is very much like building a skyscraper in New York, and then suggesting that the lower stories be removed that the offices on the top floor may have more air and their occupants be free from the annoying proximity of the less ethereal spirits quartered on the floors below them. Ideally the conception is beautiful. Practically it is Icarus mounting too near the sun.

Another of the traditions that deeply afflict the supposititious souls of our young critics is *the tradition of morals.* They tell us that the United States is the only civilized country where morals are still held to be of some moment with relation to creative literature. In the judgment of these critics, literature as one of the fine arts should be utterly divorced from morals. The absurdity of this attitude is equalled only by the assurance with which it is advanced. Music as one of the arts has, it may be granted, almost no relation to morals. Its art material is not life but sound. Literature, it is to be admitted, may deal with its fuller material fractionally. It may therefore in any given piece of literature be independent of the moral implications of its subject matter. That it should do this in the literature of any people in the mass is believable only on the assumption that that literature has narrowed itself to a survey of only a portion of its proper field. The material of literature is life, and life can no more strip itself of morals than the orchid, by being parasitic or semi-parasitic, can sever itself from the laws of vegetable growth. It may nourish itself by the decay of something else, of something that has flourished by drawing its own substance directly from the soil, but, whether orchid or mistletoe or giant rafflesia, it will, for that bandit dependence, the more surely decay soon itself.

"Aw, They Don't Belong!"

IT IS the grievance of those who belong to the school of the latter-day saints of art that morals are a part of the traditions that the past has imposed upon us. In fact, they are merely the accumulation of what the world has discovered for us with regard to the business of getting along pleasantly together in some sort of social solidarity. Moreover, the Puritans, against whom they drive their shafts with the most virulent hatred, are just that group of our fellows and our ancestors whom we can most clearly single out as having transformed morals from ecclesiastical inhibitions into social sanctions. They have been the chief active force in projecting the whole body of moral responsibilities from the dark ages of unreason into the clear light of common sense. The moral law, wherever it may be surely discovered, is a law aimed at the parasite. It tells him that it is not his proper function to blossom on any stalk whose roots are not his roots drawing their own juices from the soil. It tells him that the imposition of things that he enjoys upon those whose tastes do not find them pleasant is at least bad manners. It suggests that fattening on the contributions of other men to a culture that he has not created, has not strengthened, has not added to by one jot or tittle, is being a parasite and a sponge. It reminds him that the first instinct of the sponge, whether he walks the ties from tank town to tank town or manages to disguise his beggary by some show of legal possession, is to belittle the moral law. The sponge and the Puritan are certain to be at enmity. The Puritan can no more love the sponge than the oak can love the mistletoe. Their antagonism is as deeply grounded in self-interest as the antagonism of the householder for the midnight thief. It is as futile to try to argue it out of existence as it would be to recommend some relative of the immortal Micawber's to a Hebrew as the manager of his business affairs.

It is one of the conventions of ordinary good society that a guest at a dinner party shall not leave too immediately after having satisfied his hunger. He must remain some little time for the give and take of conversation for which the dinner may be supposed to have been the enlivening preparation. Otherwise he will seem to have ignored the obligation of giving, to have been interested only in taking, to have been, in effect at least, a parasite, a sponge. As a simple consequence of the contempt that the ordinary self-respecting man feels for the sponge, when the guest has sufficiently demonstrated his parasitic character, he will be permitted in his dining thereafter to provide himself with cocktails and make the best of his soup alone.

The moral law, it cannot be too much insisted, is at one with the laws of good breeding in its detestation of the parasite. The Puritan no less than the hospitable host is the conserver of beauty through his hatred of sham, of insincerity, of ugliness, of dawdling social awkwardness, of indifference to the reserves that make grace and charm and social ease possible. It is the distinction between the gentleman and the boor that the gentleman belongs to a social order that has a code, that he knows the code, and that he can carry himself in agreement with it. A code, any code, is more or less puritanical. It in some measure decides what should and what should not be. Inevitably it is a determinant of values. It cannot escape the business of condemning some and approving of others. Those whom it assigns to the regions of outer darkness will naturally resent their exclusion from more pleasant quarters, but here the Puritan and the aristocrat are at one. They have always been at one in maintaining a doctrine of exclusion. They have both always wished to escape the presence of the unfit. That they were so in agreement some centuries ago appears a little quaintly in a sentence that John Richard Green quotes from an earlier writer: "The Puritan squire 'left off early the wearing of anything that was costly, yet in his plainest negligent habit appeared very much the gentleman.'"

The Critic Parasite

THERE is one parasitic activity that seems of late to have been extending itself seriously. It is that of the literary critic who, not having done anything creative himself, finds his greatest happiness in scoffing at the creative achievements of others. But for those achievements, he would be little more than a soap bubble, for a moment a flash of irridescence and then a furtive and fugitive smell. It is not a great while since American literary criticism was judicial, open-minded, and fairly objective. It gave reasons for its conclusions, and it assumed that the mere expression of a vituperative opinion was not a satisfying exercise of the critical function. That that intensely personal method of dealing with critical problems should seem to be sufficient for some of our more pretentious literary appraisers now is the more amazing, because our literary development in its productive phases has been going the other way. For years literary art in America has been passing steadily out of the personal and subjective method of presentation to the scientific and objective. We have been getting rid of sentimentalism. We have been eliminating the excesses of emotionalism. We have been putting away the pocket handkerchiefs that were needed in the days of Dickens, the days of literary subjectivity, the days when sentimentalism and emotionalism ran riot together in an almost Germanic fashion. Our intellects have become cooler, our literary methods surer. We have outgrown the habit of putting our thoughts down burblingly on paper in the way of untutored self-expression. We have attained to the higher constructive artistry. We have learned to write for readers, and not simply for ourselves. We were never quite babes in the woods, because we had a substantial literary tradition to build on from the beginning. Now our best writers could give useful advice to Goethe, and a novel like Suderman's "Dame Care" has a very sickly and mawkish look in the presence of the last thing from Edith Wharton or James Branch Cabell or Booth Tarkington or any one of a half-dozen other American novelists.

When we have done this, as a kind of comic irony, certain of our outlanders turn back to the naïveté of personal subjective appraisal. They declare themselves fond, for instance, of Theodore Dreiser, and it appears to follow in their critical judgment that Mr. Dreiser must be a great man. They find themselves possessed of a dislike for Clayton Hamilton, and it is clear, therefore, that he must be some sort of donkey at whom it is proper to bray. "Booh!" is consequently the critical word for him, and so he is dismissed.

Let Them Learn Code

THIS is pathetic. Charlatanry is always pathetic. The clown at the circus deceives neither himself nor the public. He has no such intention. We may laugh at him heartily without any misgivings. This sort of buffoonery is different. It takes itself seriously, and so it deceives both itself and some considerable body of the unsuspecting. Preying so upon themselves, upon the intellectually helpless in their public, and upon the writers whom they single out for the lampoon, the purveyors of this sort of criticism are threefold parasites. They would be this if they were genuinely American, endowed with the rights of those to the manner born. They would then at least not be preying upon the courtesy of their entertainers. As guests in the house they have no such rights. Their first proper business is to learn the code, to familiarize themselves with the system of manners agreeable to their host and hostess. Perhaps, too, they have a little question whether my lady, the hostess, is of an accommodating temper or not. Is she so old-fashioned as to be mindful of her loyalty to her husband, or has she learned the art of making guests enjoy themselves in the fashion of Vienna, Berlin and Timbuktu?

We should ask them to pronounce "shibboleth" at the door. If they cannot give it the right accent, they should be told to keep on their hats, even to draw them down over their eyes, since there is a bit of wind in the air and the dust may be blowing along the street.

Your Chances of Becoming a Millionaire

Income Tax Returns Reveal How Difficult the Task Is as Income Rises

By O. M. KILE

"WHAT would you do with a million dollars?" has given way to the more modern and perhaps more practical question, "What are my chances of getting a million?"

This is a question that can never be answered satisfactorily for any given individual, any more than can the life insurance companies tell by consulting their expectancy tables how long you or I shall live. But if you will let the insurance expert figure on a thousand of us, he will not miss it far on the total number of years still allotted to the group taken as a whole, and therefore the average expectancy for each man.

So it is with wealth. Only the flight of time can determine whether you or I individually shall ever be reckoned among the millionaire or quarter-millionaire class, but Uncle Sam has assembled some mighty interesting figures during the past five or six years which throw a strong light on our legitimate "expectancy" of wealth.

First, let us have an understanding of just what we mean by "millionaire." If we mean merely anyone who is the possessor of property worth at least one million dollars, our sources of information are scant and our calculations soon ended. If, instead, we consider those with annual incomes of $50,000 or more—that is, five per cent interest on a million dollars—as belonging to the "millionaire" class, we are able to get at real facts and figures.

Under this latter definition, we had in the United States in 1920, according to income tax reports, 12,093 millionaires. This was 1,227 fewer, however, than for the preceding year. Since there are 41,609,192 persons in the United States gainfully employed, it might look at first glance as though any individual's average chance to get into the "millionaire" class was something like one in 3,000.

But this lumps together the shop girl and the banker, the engineer and the farmer. No distinctions as to occupation or present attainments are made. It is possible to come much nearer than this to fitting your individual case, as an examination of the chart on this page will show.

In the first place only 5,332,760 persons made sufficient income to get into the running at all. So if you are regularly making an income tax return, your chances for the millionaire class shoot up at once. In fact, the odds are then 1 to 400.

If you are above the $2,000 income class, your stock takes another big boost. You are now quoted as 1 to 250 shot in the millionaire income marathon. Getting out of the $3,000 class means a further spurt and reduces the odds to 1 to 138.

At this point, however, the field narrows and the good runners settle down for the real race. Getting out of the $4,000 class brings the ratio down to one to eighty-two, and rounding the next post, the $5,000 group, is a big help, leaving the odds just under one to fifty. But there the strain of the race begins to tell. It takes three more one-thousand-dollar raises to cut the odds down another one-half and when the $10,000 income mark is passed, the ratio is still sixteen to one against the aspiring millionaire.

One man in each ten who has a $15,000 income may expect to arrive at the millionaire income goal, and among those receiving $20,000 the ratio is one to six. The $25,000 man has, according to the table, slightly less than one chance in four to double his income.

These figures are based upon the year 1919, since that year seems nearer the average than either 1920 or 1921. The year 1920 showed bigger income than 1919, but 1921 dropped below 1919 in total income.

But where does the average millionaire get his income? There are very few $50,000 salaries, we know. How is the $50,000 yearly income split up?

Personal Income-Tax Returns Filed for the Calendar Year Ended December 31, 1919, Distributed by Income Classes.

3,000,000	”	4,000,000	6
4,000,000	”	5,000,000	..
5,000,000	and over		5
		Total	5,332,760

According to Uncle Sam's bookkeeping, as interpreted by Edward White, of the income tax section, the personal account books of the 5,213 persons who had incomes running between $50,000 and $60,000 would on the average appear as follows:

Income	
Salary	$14,214
Profits from private business	6,600
Profits from partnership and personal service corporations	11,116
Dividends on stocks	19,111
Profits from sale of real estate, stocks & bonds	4,613
Rents and royalties	2,200
Interest and investments	6,650
Total	$64,504
Deductions for money spent for taxes, interest and so on, not apportionable to the above items	$ 9,888
Net income	$54,616

So salary, it appears, accounts for only about one-fourth of the average $50,000 income. If you are intent upon getting into that class you must, ordinarily, develop other sources of income.

Three items in the account may, as you will notice, be grouped together. These are the income from business, either direct, through partnership or from dividends on stock. These items amount to considerably more than half the total income. Obviously the choosing and development of a business is a highly important feature in the production of most large incomes. Just how important is this choice is indicated by the fact that of 320,198 corporations filing income statements in 1919, 110,564—a little more than one-third—showed no taxable income; and this in a good business year, too. Yes, business is the all-important thing, it seems.

Now if you were selecting a business, which would you choose as offering the best chances for big income?

Not farming, logging or fishing, surely, since forty-six per cent of the corporations engaged in these lines reported no net income. Mining and quarrying were even worse, seventy-one per cent showing no net income. Coal mines did very well, however. Manufacturing showed up much better, failures to make net income ranging from thirty-eight per cent in the case of firms making rubber goods, thirty-three per cent in chemicals, twenty-six in metals, twenty-five in food products, down to twelve per cent in leather and leather products. Construction work and banking did very well also, only twenty-eight per cent in each class failing to make a profit. In trade, all but sixteen per cent made a net income, but this average is very much lower in most years.

Of course it is possible to go through with a fine-toothed comb and find lines of business here and there that were almost a sure thing in 1919. But, it does not necessarily follow that these would still prove lucrative today. Among cotton goods manufacturers, only eighty-four of 1,045 failed to make a net income above exemptions. In fact the entire textile fabric industry fared nearly as well. Only twenty-four of 802 manufacturers of agricultural machinery, steam appliances and construction machinery failed to get into the net income column; likewise only eleven of 434 makers of heavy ordnance, cars, safes, vaults, and so on. In "metal furniture, ornamental iron work, sewing machines, and so on," the business heads apparently had to be absolutely stupid to escape making a net income, at least in the year 1919. Only two out of 104 fell into this class.

How much capital are you going to require in the line of business you choose to make the necessary $30,000 to $40,000 income to carry out the program that should land you in the millionaire income class?

This will, of course, vary with the business and more particularly with the management. We find, however, that taking incorporated businesses as they come, one after the other, those making a net income of $30,000 to $40,000 in 1919 had average capital investments running about $287,000. Capital approximating $100,000 produced $11,000 to $12,000 incomes on the average.

It is interesting to note however—and quite encouraging to the man who does not have these larger amounts of capital—that the smaller sums earn the highest rates of return. For instance, the usual rates of return in a business having $150,000 to $200,000 invested was around seventeen per cent in the year we are considering. This same rate holds steadily up to investments of $3,000,000 and down to investments of $50,000. Above this figure the rate drops off rapidly and none of the 113 concerns having more than $60,000,000 capital paid in excess of ten per cent. Below the $50,000 mark, on the other hand, the rate goes up rather rapidly. Investments of $25,000 to $30,000 paid 18.2 per cent, and $14,000 to $15,000 investments returned 23.2 per cent on the average. Ten thousand dollar investments gave net incomes amounting to twenty-seven per cent and $5,000 invested, usually in a man's own business, paid approximately forty per cent. Don't mistake this for an argument for small capital. It usually means merely that where a man has only these smaller amounts to work with, he makes them work harder. But the fact that it can be done should be a big encouragement to the man just starting out.

It seems to make a difference, too, where you live as to what your chances for wealth are. In Mississippi, North Carolina, Alabama and Arkansas less than two per cent of the population filed any income tax return at all. In the District of Columbia 13.4 per cent filed, and in Ohio, Pennsylvania, Illinois, New York, California and Connecticut, the percentage runs from 5.35 up to 8.00, in the order mentioned.

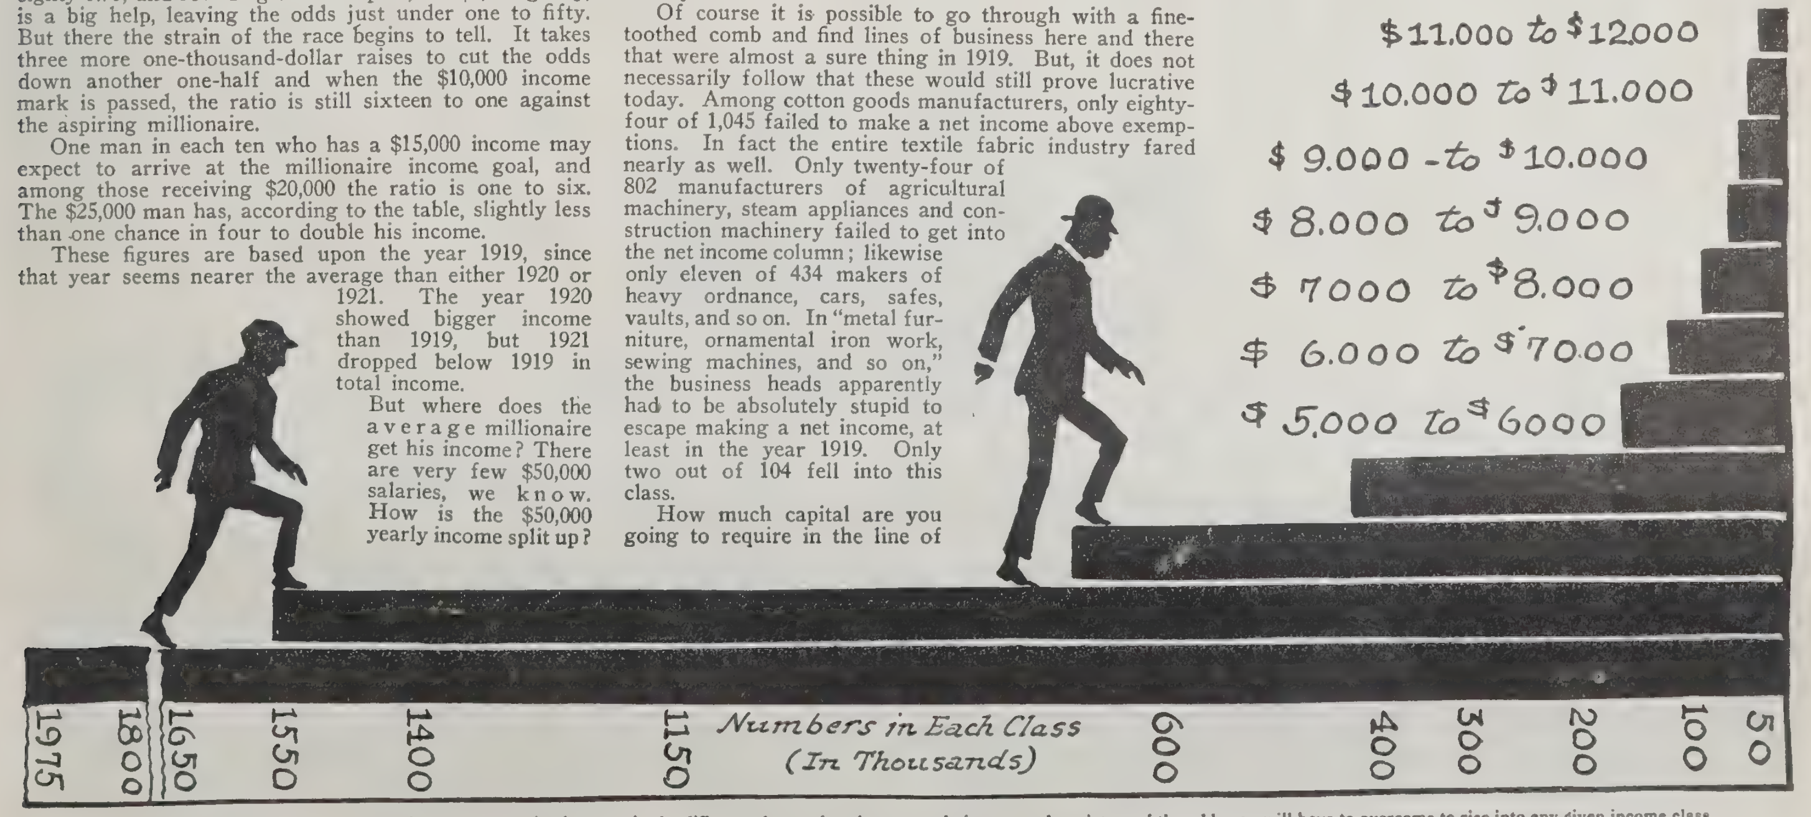
Average net taxable incomes are highest, however, in New York, where the average return was $5,030. New York had 6,420 persons who reported net incomes of $50,000 or more. Undoubtedly a large part of this money was made elsewhere, however, and reported from New York because the owner now makes his residence there.

But suppose your income is modest at the present time. How rapidly might you attain to affluence? Or taking it the other way around, suppose you are wealthy, how quickly might your income be cut off? Then again, suppose a man makes a big income and loses it. Does he come back?

You might not look for the answers to these questions in the dry statistics of the United States Treasury, but they are there if you will dig them out and make the interpretation. Here, again, Mr. White has helped us breathe life into endless income tables.

It had been said that incomes in the United States fluctuate more rapidly than in any other country in the world and our income tax figures seem to bear out this statement. But this only proves that there is greater opportunity for money making here than in any other country in the world and these opportunities invite greater enterprise, which in turn involves greater chances for either profit or loss.

We have long observed the ease with which individuals rise to wealth in this favored land of ours, but here for the first time we have something approaching an expectancy table measuring your average chances and mine.

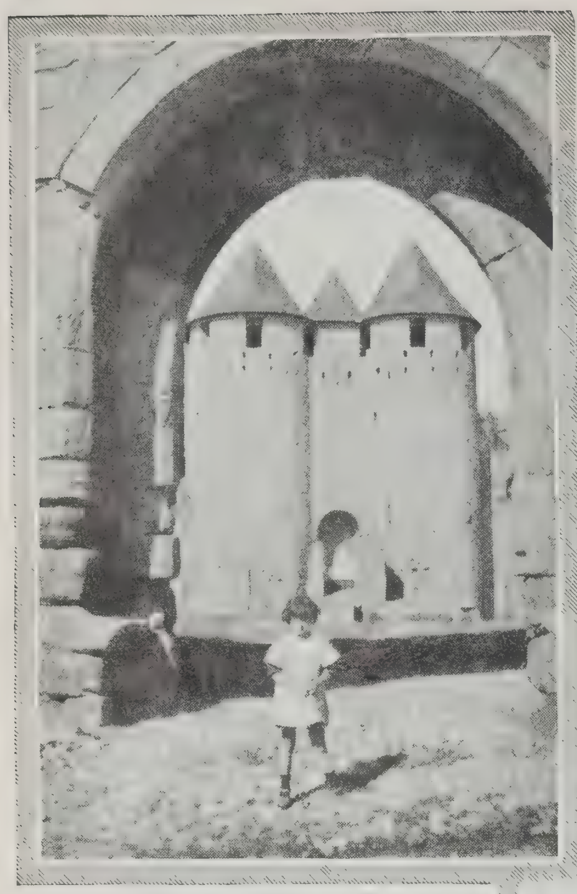


This chart, which shows the number of persons reporting incomes in the different classes, is, when properly interpreted, a picture of the odds you will have to overcome to rise into any given income class. It is based on the income tax returns for 1919.

Our Main Street and Europe's

Americans Who Really Became Acquainted With Small Towns Were Men of the A. E. F.; Tourists Seldom Get the True Perspective

By HENRY BECKETT



A child of Carcassonne, the French medieval town, now a national monument.

THE only fair way to measure America's Main Street is to lay it parallel with Europe's Main Street. That the critics have never done. They have simply written down the failings of their small towns of fancy and have hinted that these failings are common to most American towns, large and small. If the critics have any standard of comparison, in sizing up Main Street, it is an ideal conception, in their own minds, of what the American Main Street ought to be.

The authors who write about our Main Street really do not know anything about Main Street in Europe. This ignorance is general among Americans and somewhat excusable. Americans who travel do their studying in the cities, or go sightseeing in resorts of natural beauty and in towns which exist principally as monuments to the past. If by accident tourists cross a real Main Street, they are looking for a cathedral, and have no eyes, no thoughts, for the living thoroughfare.

There is one considerable body of Americans which does know Europe's Main Street—the men of the American Expeditionary Forces who were billeted on it, in France or in the Rhineland, during and since the war. These Americans, and I was among them, were astonished at the primitive state of things on Europe's Main Street. Some of us wrote home about it, and were rebuked by our elders, former tourists, for mistaking war conditions for normalcy.

The rebuke was undeserved, because the things which astonished us were not a consequence of conflict; yet from a desire to think well of our allies' Main Street the soldiers, and more recently the battlefield tourists, who actually are seeing something of Main Street, are willing even now to believe that Europe's Main Street is as it is because it has not recovered from the war. This attitude is benevolent, but in fairness to our own small towns, and by way of contrast, it might be well, at least for a change, to try to see the towns of Europe as they really are.

In physical appearance there is a marked difference between the two Main Streets, considering them merely as streets. America's is universally wide, straight and on the level, and its buildings vary uncouthly in size, and have no unity, no harmony of line, color, architectural plan. Europe's has degrees of narrowness and crookedness, and it may run over a hill, but the buildings are in harmony and form a certain unity together. America's Main Street, variously haphazard from end to end, is much the same as a whole, everywhere in the United States, because our small towns have grown up under similar conditions, within a single century, and under one government. Europe's Main Street, not everywhere the same within the territory of one small nation, varies strikingly over the Continent.

Aside from a diversity due to nationality, the moderate towns of Europe may be classed in three basic types, in their very reasons for existence. There is the tourist town, almost non-existent in this country; the town living by manufacturing, commercial position or as a university seat, and the town which came into being centuries ago, on the safety-first principle. Now that piracy is a thing of the past, and brigandage is no more, and a few shells could scale a cliff once inaccessible, and social contact is the principle of growth, rather than security, this third kind of town is stagnant, though not altogether dead.

Carcassonne, France, memorial to an age departed.

Of the three types, the only town well known to Americans is the tourists' shrine, charming, quaint, historic, possessing a castle, cathedral or museum enjoyed more by outsiders than by the inhabitants. The tourist seldom thinks of this town as a place where people live their whole lives long, but regards it as a curiosity to be inspected with a whimsical delight, and thus do I love it myself. It pleases me to see a German goat butt the door open at nightfall, and turn in with the family, yet I should not care to sleep with the goat. It gives me joy, as a novelty, to sit under a café awning and drink milk extracted from a Spanish goat, on the spot and while I wait, but I do not wish it as a regular thing. I am charmed to meet, every time I step into the Main Street of Alsatian Obernai, a goose or a pig, and six dachshunds so low and long that in turning around their hind legs stand fast, as a pivot, and they sag in the middle, and should be supported by roller skates under the stomach. I give these brother creatures greeting, and chuckle to see the stork on the housetop, for I realize that he has to live on top of the house, because there is no more room inside. Nevertheless, I do not care for the stable-house combination as living quarters. The dormer roofs are adorable but they cover dismal rooms, and the carving on the public fountain does not atone for the fact that a housewife must make a trip to it every time she wants water, because there is no running water in her home.

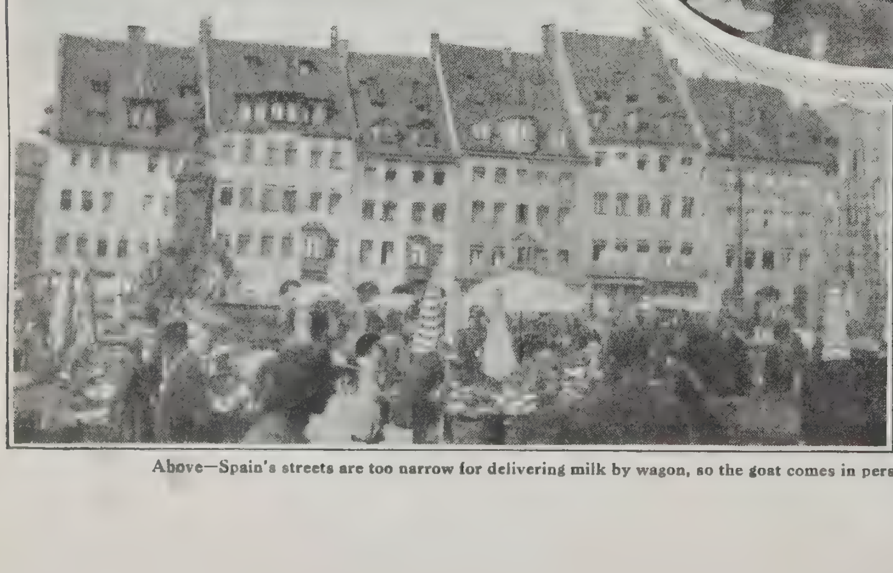
In the case of the tourists' town, their own quarters and their own interests are confused, in travel accounts, with Main Street itself and the interests thereof. This is grave error. The enthusiasms of the artist and the connoisseur are in no wise shared by the local Main Street of Rothenburg-on-the-Tauber, in Bavaria, of Moret-sur-Loing, near Fontainebleau, of Pisa, of Cintra, the Portuguese Elysium, and of Toledo, so august in historic perspective, but otherwise only a country town of Castile. Crumbling walls and a town moat where apple trees grow no longer keep out the enemy, but they are a barrier to change. Left untouristed, Main Street would sink into decay; in fact, is doing so, despite the tourists.

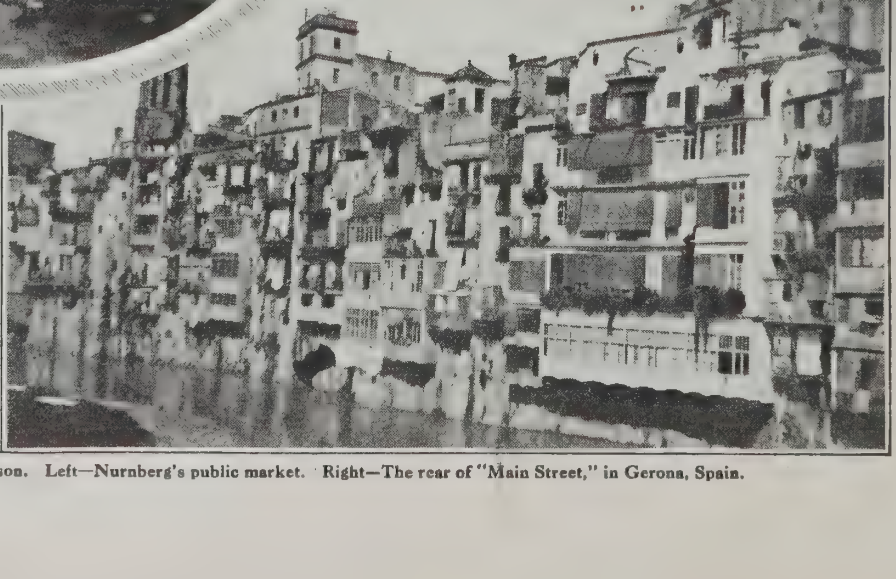
Main Street is worse in the case of the towns which function for themselves, and are not, like the tourists' towns, blessed medieval parasites on the twentieth century. In Portuguese Coimbra, a university center since the time of the Norman Conquest, women shuffle down Main Street in sabots, wear black shawls, and carry so much junk on the top of their heads that because of the pressure there is no room for any thoughts inside. The Main Street of Jäen, ever a-rumble with American trucks and tractors, is almost totally ignorant that the Moorish castle ruin on the hill behind was once the seat of a kingdom, and that its own Main Street, being truly a bit of the main highway between Granada and Toledo, is a high road, a Main Street, of history.

Main Street in Massa, center of Italian marble quarrying in foreign control, wrangles the livelong day in a bright but slovenly market place, then limps home to dine, inevitably, on sloppy macaroni, coarse bread and coarse cheese. In Chateau-Gontier, a considerable mill town of France, the gossiping in the public wash-house is as bad as any in our small town, where at least not many women rub their hands red in cold water, doing the most disagreeable work as disagreeably as possible. As for Germany—well, in a town like Freiburg, so old that one of its residents proposed the name "America" for this continent, and quite consequential, the common lot is as low as our lowest.

Without meaning to, one compares our Gopher Prairie with European towns of much greater size, towns whose names stand out in history, and have a dignity and prestige today. The town which does correspond in population to our Gopher Prairie, with its three thousand, is too hopelessly dull. It exists by and for food and shelter, the food limited to a half-dozen crude common staples, the shelter to a bunk with the animals. The tradespeople do not go to business; they live business, do business in their homes, or live in their shops.

In Portugal a family grinds its own grain. In Spain children play naked in Main Street and stone the stranger out of town, as I well know. In Italy the household dumps its refuse out of the window and nobody takes it away, and mothers wrap their babies tight in many folds of cloth, precisely like Della Robbia's "bambini" in blue and white porcelain, on the front of the hospital in Florence. In Germany, France, Switzerland and the lands to the





Above—Spain's streets are too narrow for delivering milk by wagon, so the goat comes in person. Left—Nurnberg's public market. Right—The rear of "Main Street," in Gerona, Spain.

east, self-preservation is the one activity of Main Street.

Now it is true that in the primitive Main Street of the Old World there is less bad taste in building, in paint, in decoration, than over here. Proportions are good because they are simple; so are the benches, tables, water jars, and crude fireplaces inside better, esthetically, than the bric-a-brac appurtenances of our Main Street. Europe's Main Street has the virtue of simplicity; ours has the shortcomings, yea, the horrors, of pretension in uncultivated taste.

Our Main Street tries, makes blunders, and is laughed at for trying. This applies to the activities of Main Street's society. The Boosters' Club is ridiculed for its extravagances in "pep," and puffing, but Europe's Main Street has no club, no "pep," and no pride that puffs, because its pride is stupid bigotry. Charges that our Main Street is hidebound, tries to "suppress" evolution, keeps advanced books out of the library, and is materialistic in overemphasizing manual training and domestic science in the high school, boring, rather than enlightening itself, in a sham of a Thanatopsis Club and a dramatic society, do not, to be sure, apply overseas. Europe's Main Street never heard of evolution, has no library at all, no high school, no cultural attempts.

Europe's Main Street does not have in its hotel a vulgar, shiny cuspidor and mud-colored writing desk. Nobody writes and everybody spits on the floor. The drug store is not a type of ghastly materialism, with trays of tooth brushes, cosmetics, garden seeds. Europe's Main Street does not use a tooth brush, the girls do not care enough about their looks to employ cosmetics, and, with rare exceptions, there is no garden in the town. In fact, there is seldom a drug store.

Wanting in billboards Europe's Main Street is, not for art's sake but for want of enterprise and because business knows better than to advertise there. Europe's Main Street does not boast of "seven miles of concrete sidewalks," for usually it has none and is not interested in getting any. There is no bragging about sleeping porches, for windows are closed at night, the night air being "poisonous" on Europe's Main Street. There is no "noisy garage," no silent one either. There is no aping of the big city, no telling about the big city business man who came from Main Street, for the big city is nothing in Main Street's life, which is static and unto itself.

A street shrine in Au, the old quarter of Munich.

Woman's rights and divorce do not bother Europe's Main Street. Woman cannot imagine rights, and in consequence there is little divorce, because woman must stand for anything. People do not make foolish investments; they put their money into a stocking.

The flapper problem does not exist, nor are parents worried that daughters may marry beneath their station. To prevent worry, marriages are arranged, strictly on the dowry basis, and there is no cheap, conventional honeymoon trip to the city or Niagara Falls. No, conventional housekeeping, in the parents' home, begins at once. The newspapers, on Europe's Main Street, do not print bunk and ignore vital news, for there are no newspapers. I doubt, though, whether their Main Street gets "the full truth about Russia," either from town crier, or through no medium at all.

Europe's Main Street has no social engagements, picnics, rows of magazines and books, screened porch, "Swat-the-Fly" campaigns, telephones, typewriters, toys, dairies, pianos, machines of musical reproduction, agency for agricultural machinery, Red Cross chapter, Boy Scouts, Campfire Girls, town clean-up week, pure food regulations, furnaces, tennis courts, baseball teams, gymnasium, bathtubs, ice, table manners, home reading circle, child welfare, nor sons and daughters going to college. There are no petty social distinctions because the entire population exists on one dead level, and it is not bored with sewing bees and lodge meetings because it is not interested in anything sufficiently to be bored with something else.

One cannot properly compare the two Main Streets without taking the time element into account, and the current trend. Europe's Main Street, putting it generally, is old, finished. The present generation improves nothing, except by round-about imitation of our Main Street. Whatever independent changes there are seem to be for the worse. The charming customs of yore, the colorful costumes, folk dances and songs, the festivals of a picturesque peasantry, are all being abandoned, unless as tourist ventures, and if a town has enough energy to change things at all it proceeds to electrify the candles on the altar of the church, and decorate in a manner which proves that the taste of Europe's Main Street is much worse than our Main Street's is, and worse than its own taste used to be.

The current trend is the hopeful thing about our Main Street. Not even existing, fifty years ago, it transforms itself while the critics are criticizing. Almost every development is for the better.

Three and four-story buildings, with good points, rise in place of the frame horrors and yellow-brown excrescences of yesterday, and on side streets bungalows and cottages are going up, far more attractive than the houses of a generation gone. While the plaster of Europe's Main Street is peeling off, our Main Street plants trees, lays out a park, builds in pride.

In one light the temporary character of buildings along Main Street is a fine thing. It indicates that Main Street has such confidence in itself that it dares not estimate its own tomorrow. Why build for the far future? Main Street moves so fast that the taste, comfort, and sanitation of the next generation are beyond our imagining. Leave it to the children.

The truth is that our Main Street is entirely too humble. Instead of "bullying other civilizations," as has been charged, it swallows whole the tales of its own travelers, who bluff about the culture of Europe. Really our Main Street is touchingly pitiful in its aspiration toward a culture not equal to its own. Main Street sends out much money to help poor Europe, thereby showing a cosmic consciousness fully an aeon ahead of Europe's Main Street; yet America's Main Street does not realize its own superiority to "European civilization." Our Main Street is not provincial, but the critic who considers Main Street provincial—he is.

Stream of Defective Immigrants Taints Life

Concluded from page 3

Ellis Island that the attorney for the aliens had made arrangements for a medical expert to be present at the examination, provided it take place in March, and once more the aliens' attorney, not the government, took precedence.

March 5, 1923—Melach was examined for the fifth time. A warrant for deportation was on file, and the law plainly stated, as regarded warrant cases, that at any time within five years after entry any alien, who at the time of entry was a member of one or more of excludable classes, should upon the warrant of the Secretary of Labor be taken into custody and deported. The secretary had issued the warrant far back in September, 1922. By this time it was easy to see how friends of this family had spent $3,000 on attorneys' fees and medical experts.

Commissioner Tod now strongly urged that the Sas family be deported at once. "I believe," he said in his protest, "that this is a subject which requires the closest thought and attention. As commissioner at this port, I am interested to know whether the psychiatrists here are competent to pass upon these arriving aliens, for if their certificates are to be challenged and disputed in cases where attorneys and Congressmen are active, what are those poor aliens to do, who, being excluded on their certificates, have no attorneys and Congressmen to bring their cases before the Surgeon-General? To my mind it is one of the most important phases of the immigration administration at this port that has been brought to my attention."

March 27, 1923, the Sas family was finally deported, after innumerable hearings and delays and the expenditure of thousands of dollars.

Among the many other instances of a similar character pending today is the one which has been exploited by certain types of newspapers in Syracuse and New York City, under the title of the "Sammy Goldman case." Influences working on behalf of this 15-year-old mental deficient have gone so far that they induced Governor Smith of New York and the New York legislature to petition President Harding, requesting the latter's intervention to prevent his deportation.

"Sammy Goldman, whose real name is 'Smull,'" said Commissioner Tod, "is a native of Bucharest, Rumania. The boy's sympathizers professed that he had come here from Russia, and that if deported he would be doomed to death. I fully believe that had the governor had all the facts before him, he could not have been prevailed upon to take this action, as the alien is feeble-minded beyond any doubt, is clearly in this country in violation of the law and excludable by Congress.

"This office is co-operating with the state of New York in every way to protect taxpayers and keep out of the country those who are mentally weak and a menace to the public. Where this boy is concerned, the mere fact that he is able to learn to read does not matter. If permitted to remain here he will probably marry, and, according to the Mendelian Law, about 75 per cent of his progeny will be mentally weak, if not worse. Furthermore, to admit this boy in the face of having to deport others equally entitled to consideration is manifestly unfair and unjust.

"It is being circulated that the boy's condition is due to hardships incurred in Russia. This is the favorite story of propagandists. The boy never suffered any hardships, and when he arrived here in 1921 he was excluded as feeble-minded, and his mother admitted under oath that he had always been that way. He was admitted for one year on the condition that relatives would then send him out of the country accompanied by a suitable attendant. They are now striving to frustrate the government.

"This boy's Rumanian nationality is emphasized by the Immigration Office because his spokesman in the assembly in Albany made a strong point of the fact that the boy was being sent back 'to Russia whence he was driven with curses and blows,' and 'must be torn from every relative in the world and be forced back to the waiting knout.' As to separating him from his relatives, it may be pointed out that his aunt lives in Bucharest and his mother, at the time of his temporary admission, agreed that she, herself, would take him back if later he were deported. The point as to his correct nationality is also felt at Ellis Island to be important, because doubt has been cast by his advocates on the findings of the original board of psychiatrists, who declared him feeble-minded, by the statement that when Smull was examined he was 'weak from starvation and hardships suffered in Russia.'

"Six separate psychiatrists, men trained in the detection of mental deficiency, on three occasions certified that the boy was incurably feeble-minded, according to the official records in the case.

"Smull's admission to the country was brought about by the political pressure of two Congressmen on the Department of Labor. This pressure continued and brought about the amazing situation of the immigration committee's HAVING TO CONSIDER A BILL TO ADMIT MENTALLY DEFICIENT CHILDREN INTO THE COUNTRY, SIMPLY TO GET THIS ONE INDIVIDUAL PAST THE LAW. So far did his political backers go in the desire to have him admitted, regardless of consequences to him, that they actually proposed to incorporate a provision that children to be admitted under the proposed measure should first have to submit to sterilization. The bill died in committee.

"No one save the man who sits in the office of the commissioner at Ellis Island can know or understand this great pressure that is brought to bear upon the Department of Labor to allow mental defectives, undesirables and persons afflicted with loathsome and contagious diseases to enter this country. Half the stories sent out regarding the cases of deportees are regarded from merely sentimental aspects, while the cruel facts are ignored.

"People become interested in individual instances, and this has the effect of breaking down the immigration law. The Sas family was mandatorily excluded from the start, yet lawyers and politicians juggled the case for more than two years. The whole thing is a mockery of the law, and subjects our handling of the immigration question to ridicule and criticism by other countries of the world.

"Six months ago there were 150 of these cases, but the number has been boiled down now to 83, as some of the defectives have voluntarily gone back, while not a few have married. On the basis that 75 per cent of the children of mental defectives are mental defectives, we have planted an unfortunate possibility in New York State by not acting promptly. It seems the attitude of these families who are admitted under bond, that, once in, they can fly in the face of our laws through the aid of lawyers and politicians. I don't propose that this shall be the rule by any means, and every one of these 83 cases is going to be threshed out, and where exclusion is justified, it is going to be excluded.

"There are 43,000 men, women and children in various New York institutions who came here as immigrants and who entered because of a let-down of the immigration law with respect to the entrance of mental defectives. Of this number, 46 per cent are foreign-born, and in 69 per cent both parents are foreign-born. It is all very well to sentimentalize over a mentally defective youth, but it is better to face the situation and realize that it is such cases as these which lead to the filling of our institutions with foreign defectives, when our asylums are too crowded to take care of American-born."

Since I had this talk with the commissioner, it is significant to observe further developments in the case of "Smull" Goldman. On May 8, the Goldman boy violated a deportation order when his relatives failed to take him to Ellis Island. He disappeared from his home in Syracuse soon after it was reported that immigration officials had ordered his arrest. The $500 bond posted to insure the boy's return to Ellis Island was declared forfeited. Members of the boy's family refused to give any clue as to his whereabouts. His attorney, Ralph Shulman, said: "If the authorities want him, let them find him." On May 14, it developed that Smull was in hiding in Albany with his mother. Smull was turned over to the immigration authorities. An hour later a writ of habeas corpus was obtained, and the boy was released in the custody of his attorney. **On May 22, propagandist stories were issued from Syracuse that Smull had obtained an average of 83 per cent in his school studies. The newspapers that printed this story well knew that the immigration officials had previously stated that this 15-year-old boy had been placed in school with lads of 7 to 9 years old, that being the average of his intelligence.**

(A subsequent article will detail further instances of violations of America's immigration laws, and the nature and type of attacks which have been directed against Commissioner Tod because of his efforts to enforce the law.)

From Cowboy to President of a Great College

The Picturesque Career of One Westerner

By E. B. CHAPMAN

DR. WILLIAM M. JARDINE

MOST of his waking hours since he was eight years old had been spent on horseback. He was nearing 20 now, working with a cattle outfit in the Big-Hole Basin country in Montana. In the spring there was the trip with the cattle and the other cowboys to the grazing lands, the summer was spent with the cattle and in the fall the round-up. What a glorious life for a youth.

But it wasn't a glorious life for that youth. He still was "The Kid." His tasks included getting up early, wrangling the horses and milking cows while the older men slept. Milking cows was the supreme humiliation with a "cow outfit." Other summers there had been the hay camp. As a "kid" he had done the chores then, too. But besides those chores he had raked more hay than any man on the job. And he was proud of that accomplishment.

But farming had irked him just as cow punching now irked him. He didn't like it.

At times, however, there had been glimpses of a train. On the right side of the engine cab sat a man in greasy overalls. That man represented adventure to the youth to whom a thousand nights spent under the stars with cattle carried no thrill. He envied the man who rode and guided the iron horse that carried throngs from city to city. That was the life that appealed to the youth to whom the quick turn of the broncho after a straying steer meant only work. Engineering was the magic word to the youth.

But parents insisted on school. Teachers, most of whom the youth had liked, always were urging the importance of it. Go to school, of course, he would. But he would study engineering.

The local schools never had lasted more than four months to the term for the youth. They had, however, been four months well spent by the youngster, to whom study was the road to adventure. And before long "that Jardine boy" had been employed as a public school teacher.

Thus it was that Dr. William M. Jardine, president of the Kansas Agricultural College, began his career as an educator. He didn't realize he was beginning such a career. He was teaching school simply to get the money to go to college and study engineering. The pay was $40 a month and that school term lasted six months. He was paid in $20 gold pieces, and he saved every one of them. They were the start of his college fund.

Days That Are Gone

THE week after school was out the teacher was at work with 100 other men shearing sheep. Most of the money received for that work was saved also. One summer he took charge of his father's farm. That added to the engineering fund. He worked as a cow puncher for still other money.

"That was the life," Dr. Jardine said, his eyes sparkling as he recalled the other days. And then a trifle sadly—"No boy ever will live them again. They are gone."

But his face lighted again.

"There is nothing like a virgin country, unmarked, unsullied, by man," he said. "There were immense prairies, the grass shoulder high on a horse. There were big rivers filled with fish; the mountains covered with timber that grew down to the water's edge. There were no bridges to cross, no fences. The people came from all parts of the country. They were young, hopeful, ambitious, full of life and mostly well-bred and well educated.

"Neighbors were five to 20 miles apart. The cooking—the beefsteaks we get from our mammoth refrigerating plants today cannot compare with those served fresh from the fat young animals, as we ate them those days."

The speaker was no longer in the office of a college president. His appearance indicated, for the moment, he was again on a horse, part way up the mountain side, watching the cattle below him convert the succulent grasses into beef.

However the good old days appealed to him now they didn't appeal so much then. He went to college to study engineering. Between his sophomore and junior years came the realization of an ambition. He was employed with a surveying party. That meant adventure. He was head chairman and some times had charge of the level and transit.

Some times, it is said, the story of Alexander the Great might have been different if the world hadn't been conquered so easily.

That might have been the way with the young surveyor. At any rate, his first surveying job, his first taste of engineering, was his last. The surveying party was working for the government on big reclamation projects. Without realizing it, he became interested in the "dry farming" that was to be carried on within the big tracts that were being set aside. His agricultural course, which had extended over the growing and developing years of his life, was too well grounded for his engineering course of two years. When he went back to school he took up agriculture.

Possibly he was influenced by the offer of the president of the college to give him a place as a teacher if the agricultural course was taken up. The place paid $40 a month, and young Jardine could take his college course, too. Engineering graduates were getting only $40 a month at the start, then. So the former chore boy again was working overtime—earning his pay as a teacher and carrying a full college course in his spare hours. There were only five students in the agricultural courses and the teacher-student received a great deal of personal attention and help.

The Jardine farm, although in a cattle country, devoted half its attention to grain—to farming as well as cattle raising. Then the interest aroused in the dry farming drew him into crops more than stock raising or beef production. He knew it was necessary to have feed for the stock when the grass was gone. And he soon was deeply attached to the new course. Not that he liked it all. But—

"When, as a boy, I had been given a job I was expected to do it," he said. "There wasn't any one to feel sorry for me. I would be fired if I didn't do my work. There were plenty of men to take my place. I learned then the value and advantage to me of doing things I didn't like to do. And I learned to smile while I did them.

"That is the finest kind of experience for a boy. It develops an unlimited confidence in himself and makes him expect to do things, rather than ask for help."

In Demand as Speaker

GRADUATING from the Utah Agricultural College, he became instructor in agronomy in that institution. A year later he became professor in that subject. Then he left the college to take charge of investigations in dry land farming for the United States Department of Agriculture. While at Utah he had pioneered in dry farming development and that work grew while he was with the department. His texts on that subject are widely known. He has written articles on it for foreign papers and magazines. He helped in establishing stations where methods of management and dry farming crops of inestimable value have been worked out, adding millions to the value of crops produced in western states.

In 1912 he was lecturer for the graduate school of agriculture held that year at the Michigan Agricultural College. From 1915 to 1917 he was president of the International Dry Farming Congress. The next year he was elected president of the American Society of Agronomy. He was vice-chairman of the National Council of Defense. He is a fellow in the American Association for the Advancement of Science. He is a member of the National Research Council, and the Food Research Institute of the Carnegie Corporation. In 1916 Campbell College conferred on him the degree of doctor of laws. He was married in 1905 to Miss Effie Nebeker. They have three children.

Dr. Jardine is in demand as a public speaker. He has a habit of saying things. In the depression that wiped out 75 cents of every dollar agriculture had it was customary, in the West, to say soothing things and blame the other fellow. Dr. Jardine didn't administer any soothing sirup. He told bankers, farmers, merchants and others before whom he spoke that the situation was largely one of their making. They, too, had been extravagant, careless, and had got away from sound economic principles. There was no panacea. They simply must get back to work along the old lines. Whether they would weather the storm was an individual matter for each man. He had to work out his own salvation.

Dr. Jardine became dean of the Kansas College three years after going there. He was made president in 1917. He is young, as college presidents go. He was born in 1879 in Oneida County, Idaho.

He knows the practical side of farming now, just as he did when, as a boy, he had a part in growing field crops as well as with the cattle. A few years ago he was a partner in a 6,000-acre dry farm at Nephi, Utah. He unloaded the first tractor ever taken there for practical farming purposes. He still owns an interest in another farm.

The greatest farm crop today is the crop of boys and girls, he says.

"But we must not foster the thought that the farmer's son must be a farmer or the blacksmith's son a blacksmith," he said. "The interchange of blood between the city and the country has been one of wholesome, leavening influence in our national life. We must encourage that interchange. We must offer to every child, whether urban or rural, opportunity to enter into whatever vocation or profession it may choose."

Has Done Much for Kansas

"THE new, broader education trains for citizenship," Dr. Jardine said. "Formerly we believed these matters would take care of themselves. The war showed us that error. We had failed to make Americans of many persons.

"The first consideration of Americans must not be the money group or the labor group, but the interests of free America.

"Our educational system, whatever its defects, had served admirably to bring about an unexampled democratization of society," Dr. Jardine continued. "The fact that several of the most noted men had come from log cabin surroundings had symbolized the truth and reality of democracy. What was needed was a balance between vocational or industrial training on one hand and a type that would give a broad insight into the industrial world's activity and yet develop the individual's capacity for the highest degree of esthetic appreciation possible."

Perhaps no period in the history of Kansas agriculture has seen more improvement than since Dr. Jardine went to the college. Experiments were begun and completed that resulted in the control of the Hessian fly, Black Leg, and hog cholera.

New crops have been introduced. New farming systems devised. Old methods have been found inefficient and cast aside for new ones in virtually every line of agriculture. Kansas has given to the world a new variety of wheat, Kanred.

When Dr. Jardine went to Kansas it still was attempted to farm in Kansas as the farther east states farmed. Kansans resented the insinuation they needed dry farming. He knew dry farming needs and the territories that needed that system. He knew enough about human nature not to tell Kansas it needed dry farming methods.

But he took up the methods, one by one, and showed the state the advantages to be gained until their use now is becoming general. He introduced dry farming crops into the districts that needed them. His influence on the agriculture of the state has been far-reaching. Perhaps one of the most important was his working out the system for the earlier preparation of the ground for wheat. That alone has made it possible, according to an eminent agricultural authority, to increase the average yield of wheat in Kansas five bushels an acre.

The thing Dr. Jardine works for year after year is a permanent plan for agriculture. He urges the individual to apply it. He would have the farmer select his work carefully, then stick to it. "In and outers" lose money as frequently on the farm as elsewhere, perhaps more frequently. Dairying, stock raising, grain farming, whatever it is, stick with it if it is founded on sound principles; study how to improve it, but don't give up, don't be changing every year or two, is his advice.

And so the cowboy who dreamed of adventure as an engineer found it in making semi-arid lands produce good crops; in making better land, more fortunately situated, produce better crops than it had been producing. He rides on trains, for he has been into almost every nook and corner of the state. But he travels as a passenger rather than the guide of the iron horse. Instead of guiding a train he directs education of 4,000 students in the school each year. Through the college extension department he directs the spreading of information to thousands of grown-ups and boys and girls not yet ready for college. For he insists the campus extends to the four boundaries of the state. And his associates say he still keeps as busy as he was in the old days he now has come to mourn.

Maine's Great Peak Accessible Now to Tourists

Wild and Magnificent Beauty Brings Plea for Preservation of Timber

By EDWARD L. M'COLGIN

MOUNT KTAADN (Katahdin), considered by many the finest peak in the Appalachians, which has remained almost unknown because of its isolation in the heart of the Maine wilderness, is now accessible. A motor trucking road has been completed from Millinocket to within two miles of Chimney Pond at the foot of the vertical colored granite cliffs, which for 2,300 feet form the eastern wall of Ktaadn.

Whether one be an automobile tourist seeking a New England wild comparable with the Far West, or a vacation tramper who enjoys easy mountain climbing with smashing scenery as its reward, or an experienced rock climber who will not be satisfied with anything but chimneys, cracks and traverses equal to the famous English districts, Mt. Ktaadn will prove a splendid surprise.

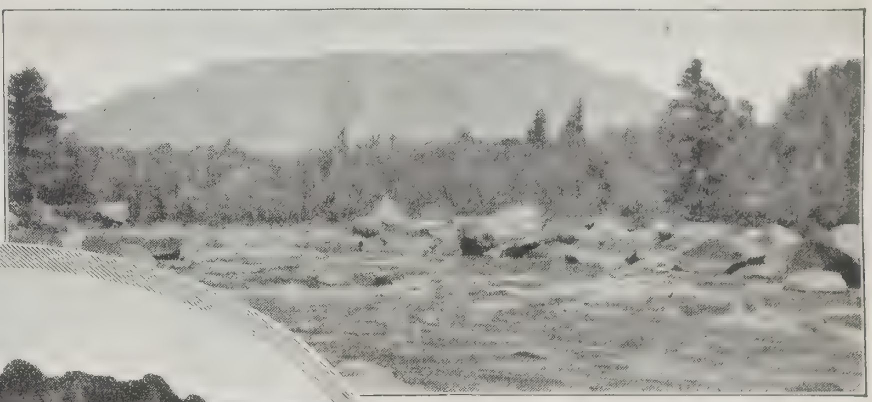
Ktaadn is worthy to rank with the several outstanding mountains of America. Were it in Canada or Europe, Ktaadn would have long since been world-famous and provided with good roads and trails to its bases where camps and hotels of the first-class would be available.

Ktaadn is located between the east and west branches of the Penobscot River about 100 miles north of Bangor; this is slightly more than 300 miles by rail from Boston and 30 miles back from the railroad. It was first climbed in 1804. The few who have since penetrated the vast forests and numerous brawling streams which surround this giant mountain have agreed with Theodore Winthrop who said, generations ago, that Ktaadn was "the best mountain in the wildest wild to be had on this side of the continent."

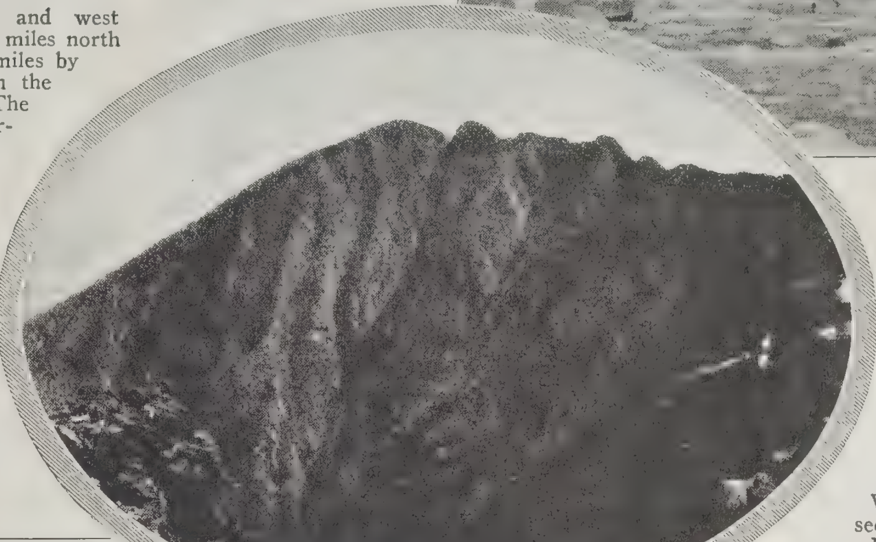
While tramping in from Stacyville I found the intervening country much as it was when Thoreau wrote of the Maine woods. Everything suggests the mountain regions of the West rather than New England.

Because of its unique beauty and unusual environment, comparatively near the congested districts of the North Atlantic states, Ktaadn should be preserved for the public before it is lumbered bare like the White Mountains, which were only made national property after their forests had been ruined for generations to come. The Appalachians are perhaps the oldest mountain system on the face of the earth and Ktaadn is their glory.

A paper company owns Ktaadn and the entire surrounding district. It has built the new road to carry supplies to its spruce cutting camps by motor truck. The management takes pleasure in offering every courtesy and hospitality to visitors to the mountain who comply with the law, especially that relating to forest fires. The camps of this company along this road and at its terminus near the mountain are exceptionally clean and well kept. Those in charge are real hosts although they only offer food and overnight lodging as an accommodation.

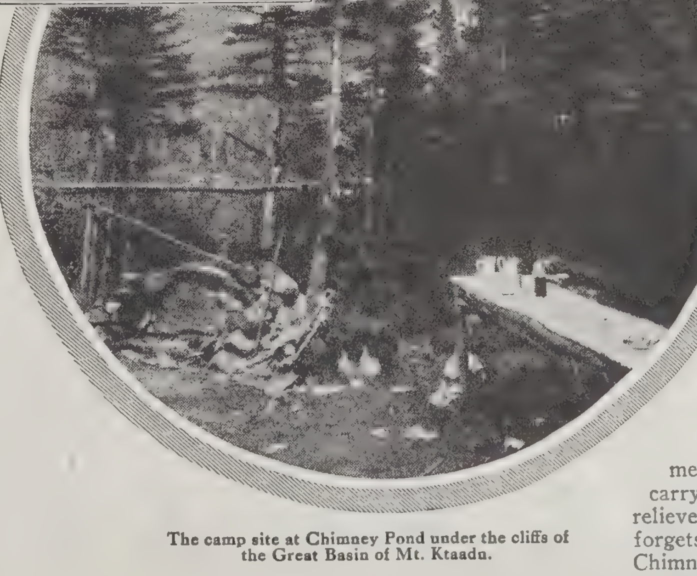


Main mountain stream with the southerly side of Mt. Ktaadn in the distance. The Abol Slide, table-land top, high peak and knife-edge may be seen.



The knife-edge crest of Mt. Ktaadn from Great Basin side; Pamola Peak and the chimney.

Mt. Ktaadn from Ktaadn Lake on the Stacyville trail showing the high peak, knife edge, the two eastern basins and Hamlin Ridge separating them.



The camp site at Chimney Pond under the cliffs of the Great Basin of Mt. Ktaadn.

Ktaadn resembles Rainier in that it completely dominates the scene. Unlike most of the other Appalachians, Ktaadn is not merely slightly higher than a group or chain of kindred mountains. Neither is its summit so rounded that it suggests a great hill rather than a clearly defined mountain mass. Ktaadn stands alone and rises abruptly from the low plain with every appearance of real grandeur. The upper slopes are quite bare.

The top of Ktaadn is an irregularly shaped plateau suggesting a triangle with southern, northwestern and eastern sides. The south end of the eastern side curves to the east making that side resemble a fishhook. Caribou once grazed upon the table-land top of Ktaadn but the game hogs made away with the last of them a number of years ago.

The southern and northwestern sides of Ktaadn rise evenly to the height of the plateau. The well-known Hunt trail climbs over the southwestern edge and the Abol Slide trail ascends a great rock slide on the southerly side, which can be seen for miles.

However, it is the eastern side which has the notable scenic features of Ktaadn including the six peaks which rise from the edge of the great summit table-land; the famous mile-long "knife-edge" crest between the topmost peak and Pamola Peak at the end of the fishhook curve; the two glacial formed cirques cut out of the granite mass of Ktaadn, one known as North Basin, separated by Hamlin Ridge from South or Great Basin which holds the beautiful eight-acre Chimney Pond, the highest body of water in the eastern states from whose twenty-nine hundred foot level the warm colored granite cliffs rise sheer to the summit peak, 5,273 feet high.

The outward shore of Chimney Pond is the finest camp site in the eastern states and provinces. A brightly colored saxifrage brought down by the great ice sheet from the Arctic, its only other flowering place, grows in profusion on the banks of the pond. The geologist and the botanist were the pioneers in exploring Ktaadn.

Chimney Pond is the terminus of the trail from Stacyville, the eastern gateway. The new road from Millinocket ends on the trail about two miles from the pond, the easy trail continuing. There are two trails to the top of Ktaadn from Chimney Pond, also trails to Hamlin Ridge and the North Basin. The Basin Slide trail ascends from Chimney Pond to the lowest point of the summit plateau. It is quite easy. Pamola trail up the great buttress peak is a long hard grind over and about gigantic boulders.

The best amateur trip over Ktaadn from Chimney Pond is to ascend the Basin Slide trail, explore the table-land, climb the high peak, traverse the knife-edge crest down either side of whose narrow width one can look for thousands of feet and descend the Pamola trail. While it is ordinarily safe, but somewhat thrilling, the knife-edge should not be attempted in windy weather.

Experienced rock climbers will find the Chimney route to the knife-edge from the pond the sportiest climb in the East. There are endless other opportunities for hard rock climbing. Roy Dudley, the well-known Stacyville guide, is an expert rock climber who has accompanied most of the qualified amateurs.

The entire state of Maine with its forests, lakes, rivers and the seacoast, including Mt. Desert Island, parts of the maritime provinces of Canada, and the White Mountains of New Hampshire, can be seen from the top of Ktaadn.

Near at hand the observer from Ktaadn probably finds the northwestern side most interesting because it holds the lure of the partly unknown. Few have penetrated the matted growth to the Klondike pond lying at the foot of the slope. There is a cirque or basin along the upper end of the side which is still to be described. To the northwest the oddly named Sourdnahunk range of mountains is to be seen. Ktaadn's nearest mountain neighbor is Turner Mountain to the northwest.

While use of the new road from Millinocket would doubtless enable one to drive to its end, make the short trail trip to Chimney Pond, eat luncheon under the great cliffs and return to town by night, few would care to make such a perfunctory call. Since there is nothing but a rude stone hearth at Chimney Pond, tenting, bedding and food must be brought in.

The classic and most interesting route to Ktaadn is from Stacyville on the Bangor and Aroostook Railroad, twenty miles northeast of Millinocket. It fords the eastern branch of the Penobscot near the famous Hunt farm, follows and crosses the Wassataquok stream, a brawling mountain torrent, which in itself is one of the finest things in Maine. The view of Ktaadn and the intervening country from the edge of the Stacyville plateau just outside of the village would be ample compensation for the trip to Maine.

The Maine laws, a copy of which should be obtained from the office of the Commissioner of Inland Fisheries and Game at Augusta, require that those carrying firearms and fishing tackle must be accompanied by a registered guide. Anyway, none but experienced woodsmen and mountaineers familiar with the region would care to venture into it without a guide. Don't confuse the trails to Ktaadn with the Adirondack and White Mountain trails which are coming to resemble sidewalks in many places.

A good Maine guide would be worth his hire merely for his companionship even if he did not carry the pack, cook the food, pitch the tent and relieve his employer of other work and worry. One forgets his troubles while sitting by the camp fire at Chimney Pond listening to Roy Dudley relate the Indian legends of Pamola.

August and early September are the best months in which to visit Ktaadn. The black flies are then a thing of the past and the mosquitoes, mentioned by Thoreau, which are encountered earlier in the season at the East Branch by those using the Stacyville trail, have usually vanished by that time.

It is a familiar saying of all who visit the Appalachian Mountains that they grow upon one and satisfy more deeply than some higher ranges elsewhere. Their lingering charm causes most people to return year after year. Ktaadn is recommended to these as well as to newcomers. The splendor and the greatness of this noble mountain must be seen to be understood.

Politicians, Operating Through Parties, Dictate Without Warrant of Law

Exact Opposite of What Was Planned by Fathers of Country, for Presidential Elections, Has Come to Be

By AARON HARDY ULM

This is the third and last article on this subject by Mr. Ulm.

WITHIN less than a year the voters will begin to decide, at least ostensibly, by ballots duly cast, on the great question of who should be the next President of this country. The general election in November, 1924, will be only the culminating one of long series of selective processes, legal, extra-legal and otherwise, which now have to do with choosing the country's ruler. The formal operation of these processes will begin when the first preferential primaries for the naming of Presidential candidates take place, which will be in the spring of next year. Such primaries at present are required by law in from one-third to one-half of the states. In others, delegates to the national conventions may be chosen without direct reference to the voters.

Then will come,

(1) The great national conventions, which will nominate the candidates;
(2) The big campaign;
(3) The general election;
(4) The Electoral College.

And if some candidate cannot command a majority in the Electoral College, it will then be up to the present United States House of Representatives to select the next President from the three candidates who receive the highest number of votes in the Electoral College.

Thus the routine of choosing a President and Vice-President has become a long and in many respects a tedious matter, involving immense detail.

Exact Opposite Obtains

IN FACT the process as a whole is so complicated and is now controlled by such a wide variety of statutes as well as customs that a person who seriously plans to "run" for President next year would be wise if he immediately engaged a good lawyer to find out and attend to the manifold technicalities that have to be looked after.

Even then his "running" would be more or less futile unless made within the realm of organized politics. For it now is all but impossible for anyone to be elected President of the United States independently of the established control of the parties.

Therefore, the exact opposite of what was planned and expected by the "fathers" has come to be.

Nothing was further from the desire of the makers of the Federal Constitution than that there should be need for anyone *"running for"* or being *"run by"* others for the highest office in the land.

Under the Electoral College plan which they worked out very thoughtfully it was expected that a group of wise and patriotic men would meet quietly, look over the situation impersonally and without partisanship, and calmly select the best available man for the job.

Political Parties Control

BUT, as pointed out in a preceding article, the plan didn't work out that way, not even in the beginning. Political parties, which the Electoral College was to obviate, stepped in and assumed control of the matter in despite of Constitutional precaution. The parties first functioned chiefly through what was known as the "Congressional caucus." Adherents of the different parties in Congress would meet, prior to each national election, and agree on the candidates who would head the tickets of their respective parties. These candidates were accepted by the rank and file of the parties for about a quarter of a century. But the protest against "King Caucus" was so virulent that that process of choosing candidates came into disrepute and broke down in 1824. Andrew Jackson, who defied the "Congressional caucus" won a plurality but not a majority of the votes in the Electoral College, which in 1824 failed to elect anyone. The House of Representatives chose John Quincy Adams, who was defeated overwhelmingly by Jackson four years later. It was during Jackson's first term that the main parts of the present system of choosing a President came into vogue.

The turning point of this system is *the party national convention.* It was first used by a "third party" in 1831. The other parties adopted it at once and though, from the beginning, it has been criticized almost as severely as was the old "Congressional caucus" the national convention holds on. The national convention probably is of more significance now than ever before, despite vigorous effort during the present century to curb it with checks decreed by both law and custom. Actually, these "checks" no doubt have augmented the significance of the national conventions and the network of political organization, which, in the cases of the big parties, revolves around them.

This isn't because the "checks" do not, as a rule, represent sincere attempts to eliminate or reduce the evils and shortcomings of our extra-Constitutional method of choosing a President. It probably is because of the fact that, so long as the forms now decreed by the Constitution have to be followed technically, it is next to impossible to develop a "check" which in most respects won't merely accentuate the evils aimed at. For Congress can do virtually nothing in the premises. It is a problem that is almost wholly in the hands of the states and it seems beyond the possible to procure uniform action on any subject from forty-eight state legislatures. Attempts on the parts of the states to solve the problem have resulted in as wide an assortment of laws, as now, so some writer points out, governs the subject of divorce. These laws, whatever the merit of most of them, give a "crazy quilt" aspect to the otherwise highly complex process of choosing the chief executive of the nation.

Most of these laws connote *the preferential primary* as a medium for giving the voters a chance to express themselves as to who shall be formally nominated candidates for President and Vice-President. In most cases the voters of each party may express themselves directly as to their choice of candidates, delegates "instructed" accordingly being chosen in state conventions of the parties. In other cases the voters taking part in the primaries may vote both for candidates and for delegates to the national conventions; in some, they vote only for delegates.

In three states, unless changes have been made recently, any voter can take part in any party's primary. That is to say, a Republican may assist in choosing a Democratic Presidential candidate, and vice versa.

But, even in those states where the voters may express themselves directly as to party nominees, there is quite a gap between the cup of expression and the lip of performance. For even then the ultimate expression of the voters' wills as made in the primaries must be left to delegates to the national conventions. The laws sometimes require that those delegates be affirmatively pledged to follow the "instructions" of the voters. In one or two states, the laws go so far as to say how many times the delegates must vote in convention for the candidates winning in their state primaries. Others merely direct the delegates to support those candidates so long as they have a reasonable chance of procuring the nominations.

Voters' Will Nullified

THUS, so far, no one has been able to devise a secure method for insuring the carrying out of the voters' wills, as expressed in Presidential primaries, in the national conventions. Delegates not in sympathy with the expressions of the voters often are chosen to carry out instructions, sometimes by the very voters who give the instructions. Such delegates may technically adhere to instructions and yet oppose them successfully. There is one historic case in which a nomination of a candidate for, and, as it turned out, the subsequent election of a President probably turned upon an action of that kind.

Where laws govern the subject, preferential primaries are held at varying times, most of them during the months of April and May of the election year. One, however, takes place as early as the last Tuesday in March. One state has provided for two primary elections, the first—for delegates to a state convention which may arrange for the second primary—occurring as early as the second Tuesday in March.

State laws, where there are any, that have to do with putting the names of candidates on the ballots used in the primaries, also vary quite widely. The acme in this respect probably was reached in South Dakota. There until the law recently was changed the candidates themselves had formally to enter the race, set forth a "paramount" issue, and engage, in person or by designated representative, in a joint debate within the state with other candidates for the party's nomination. And all these steps had to be taken early in the spring of election year. In some others a candidate must file a statement signifying that he wants to be President. In most states candidates' names were put on primary ballots by petitions signed by voters.

The New Jersey Law

IN MOST states having preferential primary laws a plurality expression is sufficient to instruct. In Indiana, however, if no candidate receives a majority the instructions are not binding on the delegates to the national convention.

In New Jersey a very elaborate law goes so far as to state the maximum amounts of money that candidates for delegates (who are chosen there in the primary) to the national conventions may spend in the preprimary campaign. The limit is $10,000 a delegate! New Jersey is entitled to 28 delegates in each national convention. Thus, on the basis of two contestants for each delegate's place in the conventions of the two big parties, the sum of $560,000 may be expended legally on that one preliminary item of Republican and Democratic Presidential campaigning in that state!

The increased cost of Presidential campaigning, incident if not due to it, is one of the chief objections made by its critics to the preferential primary as a method of selecting candidates for President.

The pre-primary expenditures made by or on behalf of candidates for the Republican nomination for President in 1920 amounted to a total of $3,000,000! On the other side of that question it may be noted that, in the case used for illustration, no one of the "big spenders" ultimately won the nomination. At least one, it is rather generally agreed by students of politics, lost the nomination on account of reckless expenditures.

It is worth while noting, as against the preferential primary, that in the case of neither one of the big parties did a candidate having the greatest volume of approval as expressed directly by the voters win the nomination in 1920.

However, it was the fact that he had won the approval of the voters in the greatest number of states that had held preferential primaries which was among Woodrow Wilson's greatest leverages in the Baltimore convention of 1912.

Defects Not Corrected

THOUGH the preferential primary reached its highest influence in 1912, little has since been done to extend it and virtually nothing to correct its defects. For the last several years the pendulum has swung the other way. In at least one state, the laws requiring the holding of a preferential primary for passing on Presidential candidates has been repealed. In several others the legislatures have repealed similar laws but in two or three of these cases the voters, on referendum, annulled the acts of repeal. Several state legislatures, at this writing, are debating the question of repeal; none, so far as the writer can find, is newly adopting the preferential Presidential primary or enacting any legislation to perfect that institution or otherwise to simplify and popularize the election of the chief executive of the country.

Thus, both by reason of and in despite of serious attempts during the last twenty years to bring the selection of a President closer to the people, the power of the politicians over the task of filling the highest office in the land will be in 1924 as great as and possibly greater than ever before in history.

Though the voters may be free to choose between the offerings of the conventions, the system operates so as to limit the range of choice, exercised directly by the voters, to only two out of many millions of persons for the office of President of the United States. And those two will be selected by agencies beyond the positive control of, and only vaguely responsible to, the electorate.

What can be done to correct the matter, and simplify and genuinely popularize the election of President?

A straight-out "popular" method of voting for President isn't likely ever to be adopted, though it has been advocated by many able men since the time when Thomas H. Benton led in pointing out the evils and certain dangers of the system which for a hundred years has been in vogue. For a fully "popular" method of selection would place the Presidency within the invincible control of a few of the most populous states.

Get Rid of Electoral College

THE abolition of the Electoral College no doubt would eliminate some of the needless complications existing at present.

However, the situation in fact may not be so bad as the above review probably seems to make it appear.

It is a truism of political science that no people have ever been governed except by their consent—which does not necessarily mean approval.

And, to reassert what was said in another article, the Anglo-Saxon mind, which in times of crisis always is dominant in this country, generally can be depended on to find ways to get around if not to solve intricate political problems. This is illustrated by our present extra-Constitutional system for choosing the head of the nation.

It repeatedly has been demonstrated that when they are determined, the voters can thrust their wills through all the befuddling impedimenta encumbering free action on their part.

But for the present the Presidency is a prize stake for which the politicians can battle much more freely and decisively than any other of like attraction in the world. For about nine out of ten parts of the process of selecting a President are purely political and have no specific warrant in the Constitution or laws of the country. They are managed primarily by the organized forces of the parties, which forces naturally are under the control of the more or less professional types of politicians. Efforts, both by law and change of custom to make it otherwise, have proved, so far, to be virtually futile.

Our Only Woman Patent Attorney

Has Added Distinction of Never Losing a Case Before the U. S. Supreme Court

By CARL SCHURZ LOWDEN

THINK of the many women who earned a few dollars a week as housemaids or "hired girls" 30 or 40 years ago. How many of them had the will power, the grit, the determination to amount to something? And how many of them did? Not many. But one of these who did is Florence King, eminent citizen of Chicago, who has yet to taste defeat before the United States Supreme Court. She is the only woman honored by having her name placed on the government's register of patent attorneys. She heads the National Women's Association of Commerce and is the only woman member in the Illinois branch of the American Association of Engineers.

Florence King is now known internationally. The Montreal *Star* succinctly sketched the low-light and the high-light in the amazing career of this woman when it thus presented her:

"Twenty years ago earning $1.25 a week; today a Chicago attorney licensed to practice in the United States Supreme Court, and with the record of having put a $5.000,000 corporation entirely out of existence by proving in open court that the corporation was wrong and that her client was right. These are the extremes of the achievements of Florence King who is a self-made woman if ever there was one."

That overworked word or phrase, "self-made," peculiarly applies to Miss King. Her father and mother were Iowa pioneers; in that state she was born. She became a half orphan at five years of age when her mother had to shoulder the family burden alone. Those days of hardship and rigorous efforts forged a bond of attachment between mother and daughter which is much in evidence today; for they are real pals with the surviving parent intensely proud of the outstanding and noteworthy success her daughter has gained through unceasing endeavor.

Miss King is self-educated in the ordinary branches, self-educated in law, self-educated in patent law; and she made her own living during the educative process. She also helped her mother and the other members of the fatherless family. For a time she did housework at the lowly wage of $1.25 a week with board and room supplied. Then she ventured forth to Chicago, became a stenographer at $6 a week and spent her evenings in a night school fitting herself for the big opportunity to arrive later. She believed in the preparedness policy.

Miss King then met J. G. Parkinson, a deaf-mute who was also a patent attorney in Chicago. He labored, of course, under a severe handicap; but he had a trustworthy stenographer who knew the sign language and who patiently assisted him to the extent of her ability. He was absolutely dependent upon her. Everything went well until illness forced her to go to a hospital. Mr. Parkinson then turned to Miss King who responded to his desperate need, though not without some misgivings.

The former housemaid had to communicate as mutes do, but she knew nothing about the system. She learned the language. Her night schooling served her well. The woman in the hospital died; the position which had seemed only temporary, became permanent. For a long time Miss King was associated with this deaf mute attorney, but she acted virtually as his business partner and was thus enabled to master the intricacies of the law on the subject of patents.

Would Like Judgeship

IN THE life of every one there are certain turning points, certain moments when a career is much in the making. This successful Chicago woman admits that her experience with Mr. Parkinson was one of these climaxes in her own career.

"I presume you feel," I declared, "that you have found your life work."

"Absolutely," she avowed. "I am not interested in any other kind of an occupation. I wouldn't care to change unless I could get the appointment to a Federal judgeship here in Chicago, but I fear it would be too revolutionary in character for a woman to hold such a position at the present time."

After the Parkinson days Miss King became a patent solicitor in her own right, also qualifying as a mechanical engineer and as an electrical engineer; knowledge of this kind is absolutely essential in the procuring of patents for clients. Being the only woman member among the 2,250 comprising the Illinois department of the American Association of Engineers, she also has the honor of serving as its vice-president. I name this distinction not because it is the only one but because it stands as one among a comparative many.

A friend informed me that Miss King was the first woman to be admitted to practice before the highest tribunal in the land. For some reason, I could not quite accept the declaration as a fact; so I asked Miss King herself, as she would be direct testimony.

Miss King and her mother on the steps of the Chicago Art Institute.

"Oh," she laughed, "Belva Lockwood was first, but I happen to be number four."

Various persons had solemnly asserted to me that Miss King had never lost a case in her long practice before the Supreme Court of our country. That seemed almost too remarkable to be true. Was it possible or were they over-enthusiastic? Again I thought she should know, and again I questioned.

"Yes," she frankly affirmed, "it is true. I have been unusually fortunate in that respect."

Miss King's hobby is women's rights. If she had not been a zealous advocate of the principle that the sexes should be as equal as practicable in the sharing of rights, she would not be head of the National Women's Association of Commerce. Strange as it may seem, this organization may disband at any time. Sounds like failure, doesn't it? Well, you see, it has achieved the purpose for which it was formed, and the need for its continued existence has passed.

In 1912 when Miss King was a member of the Chicago Chamber of Commerce and had some small duty to look after in connection with the payment of dues, she was awakened to the fact that women had only a negligible representation in such organizations. Of the women members in the Chicago body none held a committee assignment of any real consequence. During that year she resigned, interested the business workers of her sex and organized the Women's Association of Commerce. It was distinctly a protest against the one-sided dominance of man.

The organization flourished from the start. The fame of the attempt spread to women elsewhere with a similar grievance. They sent for Miss King, who made clarion-like addresses and founded branches in other cities such as Cincinnati, Columbus, Indianapolis, Detroit, Cleveland and Grand Rapids. With this expansion of the movement it became advisable to make it national in name because it had about grown so in fact.

Pioneer of the Family

WHAT was the result of all this agitation? Ten years ago women members in chambers of commerce were almost as scarce as the proverbial hen's teeth, but today 97 per cent of these organizations have feminine names upon their rolls. Quite naturally the N. W. A. C. considers its work accomplished and is willing to disband; but if Florence King should discover a need for its continuance, it would be most certainly continued.

If you ask Miss King whether her immediate or her remote forbears entered the legal or the mechanical professions, you will discover her to be the pioneer of the family in that respect. Early in her life she showed a definite bent or disposition toward mechanics.

MISS FLORENCE KING,

The first and only woman patent attorney registered in the United States Patent Office.

"I never cared much for dolls or the ordinary playthings that girls like," she will testify as she returns to those bygone days. "I wanted a carpenter box. I always wished to cut and make toys and other things."

She got the carpenter box, too. She worked for it just as she worked for her education, picking it up a little here and a little there just as she could, and helping her mother at home at the same time. Long after she acquired the box of tools, she managed to enter Mt. Morris College; at the beginning it was not much better that a mere foothold but "by the sweat of the brow" she made her own way through, and was graduated.

Chicago beckoned to the "little girl of the carpenter box," and there she obtained the position as a stenographer. It was another foothold, but her natural tenacity and will to succeed enabled her to continue on the job; not only that but she also achieved her great ambition to study law by going to night school throughout a period of two years. Then, specializing in patent law, she took another two years in mechanical and electrical engineering. She formed a large acquaintance with many engineers and inventors who noted her mechanical aptitude, shared their problems with her and shared the fruit of their years of experience.

Then came the long, long pull for recognition in a field where no woman had trod before. The difficulties were heart-rending and well-nigh insurmountable; but this gently forceful woman with the dauntless spirit of the pioneer persevered. She weathered the starvation or semi-starvation time usually encountered in becoming established in one of the learned professions, and she triumphed over the additional obstacles due to the fact that she was of the "weaker sex." Florence King really has spent a large proportion of her life in overcoming handicaps and breaking down barriers either for herself or for her sisterhood.

In 1903 she won her great victory, the victory that decisively established her as a patent attorney fit to cope with men and to outfight them. It was a case that related to the axle boxes of railway cars. She stood the opposing counsel figuratively upon their heads, defeated some of the most brilliant lawyers in this country and put out of business a large English corporation. The modern Portia had proved herself.

A Newspaper Tribute

"FLORENCE KING," a Chicago newspaper declared on that occasion, "has won the most brilliant legal battle ever fought by a woman. She marshaled her arguments as a general does an army, and her line of defense built up in many months of careful study was impregnable. She won the biggest legal woman's victory yet chronicled in the United States, if not in the world."

Another Chicago newspaper pictured her as well equipped with a knowledge of mechanical and electrical engineering that amazed, confused and dumfounded all the "array of engineers and lawyers on the opposite side of the case." Ever fighting and ever pulling herself up by her boot-straps, as it were, the "little girl of the carpenter box" came into the glory rightfully hers. She felt the thrill that comes with the realization of any dream long fostered in the imagination.

Her quarter of a century of law practice has endowed Miss King with a true perspective of the potentialities that lie in creative ideas. She is, as may be expected, quite enthusiastic.

"Every boy and girl, man and woman," she says, "is a possible discoverer and inventor. Many of the most ingenious and helpful things have emerged unexpectedly. The simple idea may develop into a remarkable product.

"Women must be in earnest, must put their whole heart and soul into whatever line of endeavor they adopt. At the present time matrimony is a speculation: if successful, all right; if not, you are no better off, perhaps worse than before. Therefore woman should not look upon matrimony as a goal. Attainment of one's chief aim should be the goal, followed with the utmost perseverance and sincerity."

The "Lost Decision": a Story on Coal Rates

"Forgotten" Ruling Handed Down in 1914 Held to Have Cost People Millions as a Result of Its Never Having Been Enforced

By WILLIAM A. M'GARRY

IN 1914 the Pennsylvania Public Service Commission handed down what was said to be the first railroad rate decision that, if put into effect, would result in an actual reduction of net revenue to the railroads named. The decision applied specifically only to the rates on anthracite coal to the Philadelphia district from the three Pennsylvania hard coal fields, and according to careful estimates it meant a saving to the consumers in that district of approximately one million dollars a year if the coal dealers passed along the reduction. Consumers elsewhere also stood to save, since enforcement of the decision would be followed inevitably by appeals for like reductions of exorbitant freight rates on anthracite to all points where it is shipped.

The simple facts of what happened to that decision during the nine years that have intervened are of interest at all times to buyers of hard coal, not only as they help to explain the history of increases in the price of anthracite, but in their possible effect on the supply for next winter and the price that must be paid for it. They are of specific value to all citizens at this time, when the United States Coal Commission, sometimes known as President Harding's Fact Finding Commission, has announced that it intends to recommend reductions in the hard coal freight rates. Apparently the members of the commission are wholly unaware of the decision still standing on the legal records of Pennsylvania, never enforced for more than a few weeks but never legally canceled or repealed. Nevertheless the action of the President's commission holds out for the first time in a quarter of a century the hope that a method may be found to halt the rise of anthracite prices by striking at the root of the evil.

Find Rates Too High

THE United States Coal Commission, of course, was not in existence at the time the decision was made. It was created only last year, as one step in the settlement of the soft coal strike. It was charged with the duty of investigating conditions, including wages, working conditions and costs and prices of coal, to the end that its report might help to stabilize the coal industry and by eliminating differences make future strikes unnecessary. Although the hard coal interests have not bound themselves to accept its recommendations, the survey has been extended to cover the anthracite as well as the bituminous fields. It is unnecessary to go into any more detail about the work of this commission, but it may be well to quote the three outstanding reasons given by John Hays Hammond, chairman of the commission, or one of his representatives, for recommending freight rate decreases. They are as follows:

"First: The members of the commission are convinced that anthracite rates are too high as compared with bituminous rates when the price of the two grades of coal is taken into consideration.

"Second: The commissioners are inclined to think that anthracite coal rates are too high when compared to the rates of other expensive commodities.

"Third: Anthracite coal is comparatively easy to handle when compared with soft coal, and handling should be taken into consideration in framing rate schedules."

It should be borne in mind that these reasons were put forth only after most of the members of the commission had gone into the anthracite fields for personal investigation. There, without learning anything about the reduction ordered nine years ago, they got the facts which the railroads have been trying ever since to conceal, and on which that reduction order was based. Unquestionably those facts include figures covering the present cost of handling hard coal shipments. The railroads have been protesting that all costs have increased, but it is hardly likely that their increases have been large enough to equal the advances in freight rates which have been made since the reduction was ordered in 1914. If it costs them more for supplies, those costs have been offset to some extent by the fact that larger coal cars are being used, longer trains are being hauled, and there has been a parallel improvement in mechanical facilities for loading and unloading coal. To give but one example, the Pennsylvania Railroad has increased the size of its coal cars from fifty to seventy tons.

But Records Tell the Story

A REDUCTION turned into an advance, or rather a series of advances, may seem impossible to those not acquainted with the ways of anthracite. The records, however, speak for themselves. The legal battle that led to the order for the reduction was started in 1912. In that year and for many years thereafter the rates under attack ranged from $1.70 to $2.10 a ton on prepared sizes of anthracite from the different fields to Philadelphia, the distances covered averaging less than 150 miles, most of which was down grade. Today coal is being hauled by the same roads over the same distances for rates ranging from $2.39 to $2.52 a ton on prepared sizes, and $2.14 to $2.27 a ton on pea coal and buckwheat sizes. The 1914 pea and buckwheat rate averaged twenty-five cents a ton less than the rate for prepared sizes, which include broken, egg, stove and nut.

The existing rates, although still high, do not represent the peak. Until after the settlement of the strike last year they were much higher. Then, it will be recalled, the Interstate Commerce Commission ordered a ten per cent reduction, so that present-day rates are reduced that amount below what they had been. Even with that reduction it will be seen that it costs the consumer from forty-two to sixty-nine cents a ton more for freight today than it did nine years ago; or rather, that is the basic increase. The consumer really pays a great deal more by the time the coal dealer takes his profit on the freight rate.

To return to the original decision, however, it called first for a reduction of forty-five cents a ton in the basic rates, some of the cuts being higher and some lower. When the attack on the coal freight rates was started the controlling power was vested in the old State Railroad Commission. During the hearings that commission was succeeded by the present Pennsylvania Public Service Commission. The late Samuel W. Pennypacker was chairman when, in 1914, he ordered the reduction described. Some of the delay had been caused up to that point by the change in commissions, but by far the greater part of it was due to the tactics of the six railroads directly involved. It is not necessary to go into all the details, but an incident which is typical will show how the roads attempted to fight the reduction. Officials of all the anthracite carrying roads insisted under oath that their accountants had never estimated the actual cost to the roads of hauling hard coal. It happened that the late Wharton Barker, onetime Populist candidate for President, knew better. He had seen the figures. Just when the case against the roads seemed hopeless he made affidavit to that effect, and the commission was able to order that the books be produced.

When the reduction was announced the railroads gave notice of an appeal to the state court which handles such matters. Through one pretext or another they managed to delay action of any kind until 1917. Then the campaign was reopened and the services of the attorney-general of the state were enlisted. He appointed a special assistant to look into the matter. At that point the railroads decided it might be better to agree to some sort of a reduction, rather than have the subject reopened and risk the possibility of an even more drastic cut. Accordingly a series of conferences was held between officials of the six railroads and the attorneys for the complainants, comprising several business men's organizations and the city of Philadelphia. The railroads agreed to put the reduction into effect on a fifty-fifty basis, and agreement finally was reached on a basic rate of $1.45 a ton, as compared to the $1.70 then in effect.

Little "Joker" Kills It

WITHIN a few weeks the rate went into effect. But it had not been enforced for more than another two or three weeks when the Federal railroad administration announced the first of its rate increases, averaging fifteen per cent. There were several "jokers" in the order granting that increase. One provided that all recent rate reductions were to be restored before the increase went into effect. Another granted a greater rate of increase on rates that had not been increased for a stipulated period. The net result in so far as coal consumers were concerned was that, instead of saving a million dollars a year in Philadelphia on their coal bills, the increases in freight rates added considerably more than that sum to the exorbitant prices they had been paying. Still later the government granted another increase in rates which was permitted to apply to anthracite, bringing the rate to Philadelphia up to $2.66. There it remained until the 10 per cent reduction hereinbefore referred to.

The reader does not need much mathematical skill to figure out what this forgotten decision has cost the consumer. It was estimated that Philadelphia would save twenty-five cents a ton on about four million tons a year, or one million dollars a year. Instead, the consumers have paid from fifty cents to a dollar a ton more in freight rates for nine years. Even on the old tonnage estimate, that would mean from two to four million dollars extra to the railroads, but since then the tonnage has increased. Of course, the same increases have been made to apply to anthracite shipped to all other points. On a rough average of sixty-five million tons a year, the hard coal carrying railroads have been getting from thirty to sixty million dollars annually over and above rates that the Pennsylvania Commission found to be fair and profitable nine years ago. The peak rate was in effect for about four years, so that it represented an extra income of approximately two hundred million dollars to the railroads interested. The total extra income for the whole nine-year period can easily be figured to run well over three hundred million dollars.

It is not difficult to understand some of the huge dividends of the coal carrying railroads when those facts are known. The roads against which the rate reduction was ordered are the Philadelphia & Reading Railway, the Pennsylvania Railroad Company, the Lehigh Valley Railroad Company, the Delaware, Lackawanna & Western, the Erie and the Central Railroad of New Jersey. The Reading carries most of the tonnage, but the D. L. & W. also has a profitable anthracite business, so much so that it was able to pay a 100 per cent dividend a few years ago. There are, of course, other roads interested in hard coal hauling, as for instance the Delaware & Hudson. The decision did not apply to them because no part of their haul comes to Philadelphia. If it had been enforced against the other roads it would have been only a question of time until other communities—New York, New England and the Middle West, for instance—appealed for similar reductions against these other roads.

Two men who took part in the fight against the railroads are dead now. One of them was Major Ward W. Pierson, attorney, who was killed on the American front in France two days before the Armistice was signed. The other was Harry E. Bellis, a rate expert. The third, Harold S. Shertz, law partner of Major Pierson, is still an active opponent of high freight rates. If the Federal commission which has recommended the reduction of the rates on hard coal gets to the point of looking at his evidence no doubt it will be able to find more than the reasons given above for its recommendations. But Federal commissions which investigate hard coal have always developed the habit of making their surveys more or less under the supervision of the operators, who insist that the matter of railroad rates is something with which they have nothing to do. Men acquainted with actual conditions, on the other hand, insist that the railroads still control anthracite production to as great an extent as they ever did.

Tariff Most Important

IF FREIGHT rates can be reduced the consumer may hope to get reductions elsewhere all along the line. The possibilities of such reductions may be found in the annual reports of almost any of the big anthracite railroads and operating companies. Evidence also crops up in the news from time to time. Not long ago a row developed that made it possible to get the president of a colliery on the witness stand before a Federal judge at Sunbury, Pennsylvania. He testified under oath that he paid $750,000 for his mine three and a half years ago. He borrowed $725,000 from another millionaire operator. In the first year and a half the colliery earned $1,500,000. Within the three years the operator paid off his loan of $725,000. He also paid, to the man from whom he had borrowed that amount, $400,000 in commissions as coal sales agent. The agent, needless to say, never saw any of the coal and never actually handled any of it.

The question of rates, however, is far more important in many respects than that of colliery profits. Even in districts where anthracite is not generally used, the anthracite freight rate to other points is of some importance. A high rate on anthracite makes it possible for the railroads to argue for equally high rates on bituminous coal. The differences between the rates are still marked, although not so much so as nine years ago. It has been pointed out that the United States Coal Commission finds anthracite cheaper to handle than soft coal. Yet when the rate battle was started it was shown that some railroads were carrying soft coal to tidewater distances, ranging up to 600 miles, at a rate no higher than that charged by other roads for hauling hard coal 100 miles. The freight rate on soft coal may be taken as an indication of how cheaply it may be hauled and still show a profit. If anthracite freight rates are permitted to remain high it is only a question of time until the soft coal rates are brought up to the same level, and in some cases that has already been done.

Rail Control the Evil

OTHER conditions in the soft coal fields also may be affected by anthracite. It will be recalled that the agreement under which the hard coal strike was settled expires September 1 next. Miners already have indicated a willingness to avoid a strike, having abandoned the demands made last year. They are to meet soon to formulate new demands, the chief of which will be for a universal eight-hour day. In event that a settlement is not reached and the hard coal mines are closed September 1, it becomes obvious that the soft coal producers can get more for their output, and can get a greater output by many millions of tons. If citizens are to bring any pressure to bear on governmental officials to avert another strike and to force reductions of last winter's prices, the time to begin is now. It will be too late if they wait until after the coal commission has made its final report. That report, under the instructions given the commission, must be made before July 1 of this year. A general convention of all the anthracite union leaders will be held in Scranton, beginning June 26.

The miners know better than any other class the full extent of railroad control of coal production. Again and again the workers in the mines have insisted that this is the basic evil of the industry, and at all times they have been willing to help in any public movement to break the grip of the railroad monopoly of hard coal, and to prevent the establishment of a similar combination in the bituminous fields. Attacks on hard coal freight rates based on the facts found in Pennsylvania and on those more recently brought to light by the coal commission cannot fail to have some effect on the price of coal next winter, if that effect turns out to be only prevention of another increase.

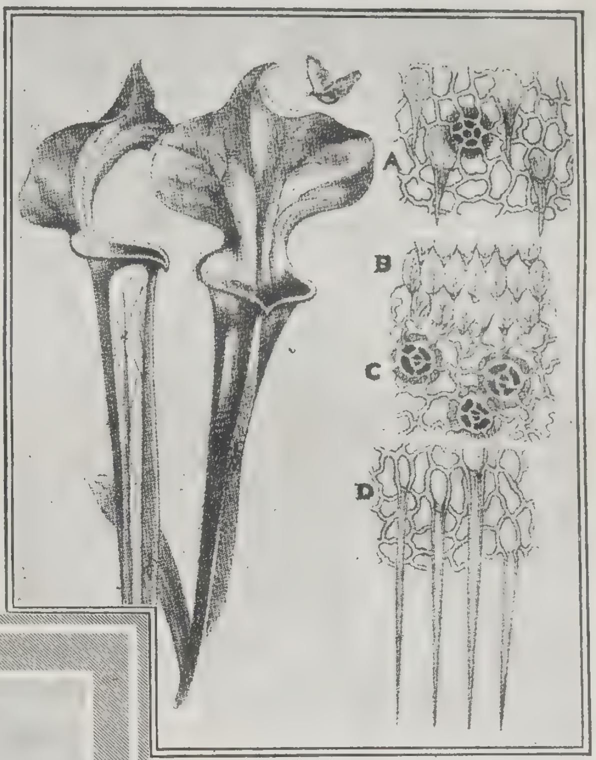
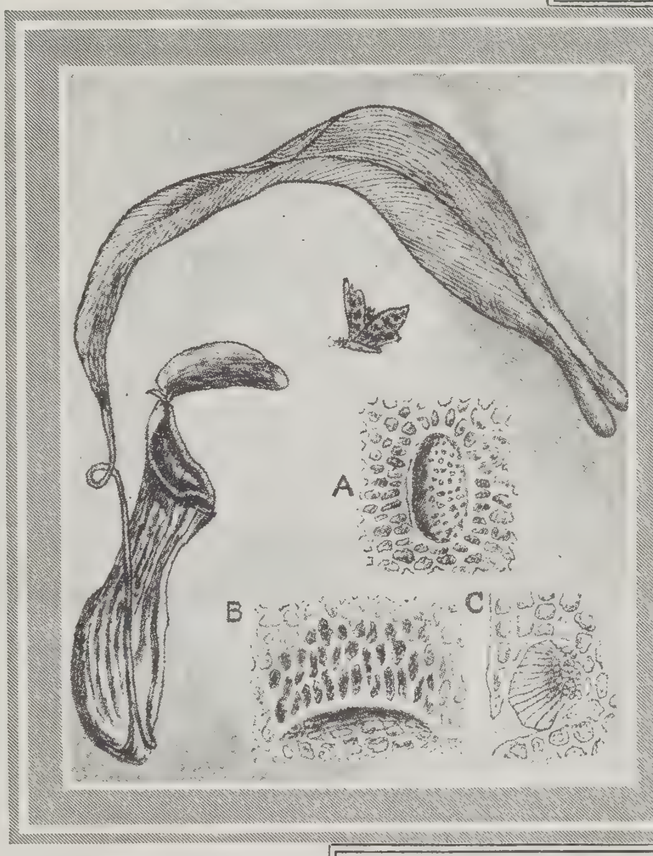
President, Ramsey Institute of Technology, St. Paul, Minnesota.

Meat-eating Plants—Myth or Fact?

IN A recent article which appeared in the Swedish scientific journal, *Vetenskapen Och Livet,* Dr. R. Dubois, professor of physiology at the University of Lyon, discussed the question of meat-eating plants. Strange stories have reached us from foreign lands concerning plants and trees possessing well-developed carnivorous tendencies. Not long ago a Central American explorer, in a lecture, stated that in the great lakes of Nicaragua an awe-inspiring tree grows. It seems to thrive on flesh and it is equipped with numerous suction-mouths that are generally closed but which open to receive nourishment. According to this explorer, whenever an animal comes in contact with the tentacles of this terrible tree the suction-mouths begin to operate and gradually extract the blood from the animal. When this operation is completed this carnivorous tree devours the flesh. The remaining skeleton is then cast aside by the uncanny being thus making room for the next victim. The "Baron Munchausen" of Central America tried to remove the "hearsay evidence" feature of his gruesome yarn by relating that one of these trees captured his dog. In vainly trying to rescue the animal, the explorer came into contact with the horrible tentacles of the monster tree with the dire result that portions of flesh from his hands and legs were literally torn loose by the "devil-tree." It is unfortunate that our valorous explorer lost his camera during his set-to with the tree. Subsequent search failed to reveal the slightest trace of the missing camera, and the gentleman, "lately from Nicaragua," came to the conclusion that it was spitefully devoured by the meat-eating tree. The unfortunate loss of the camera prevented the explorer from bringing back photographs of the monster tree. Sketches from memory, however, have been reproduced in certain pseudo-scientific publications. So much for the mythical, and now for facts. Professor Dubois points out in his article that the French biologist, Claude Bernard, was the father of the modern "general biology." One of the fundamental tenets of this science is that, "the same biological laws hold good both in the plant and the animal world. The life mechanism and life's hidden motor principles are fundamentally alike in both." The sharp demarcations, which previously existed in the study of the various objects and living things found in nature, have disappeared. In certain scientific quarters this law has given a new impetus to the hypothesis that some plants actually consume meat by essentially the same mechanical and physiological processes that are used by animals. The notion that meat-eating plants actually exist is not new. The English botanist Ellis, in the year 1768, sent a specimen of the fly-catching plant *Dionaea* to the great Swedish botanist, Karl Von Linne. It is a well-known fact that the leaves of the *Dionaea* close when insects alight on their upper surface. Linne, however, did not believe that this plant lived on insects as did Darwin and his followers in more recent years. The Darwinians were fascinated by this subject, and Darwin's book, *Insectivorous Plants,* became a greatly celebrated monograph. Critical experiments are lamentably lacking in this work. Moreover, in Darwin's time, bacteriology was almost unknown, and only scant information concerning the chemistry of digestion was available.

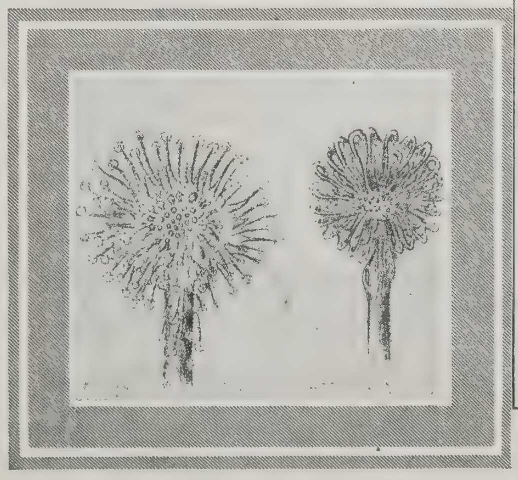


Urn of Sarracenia Purpurea Plant. **When insect approaches the urn it is enticed by honey-glands *A* downward into interior. Glands *C* guide insect to region of bristles *D* which prevent insect's escape from urn.**

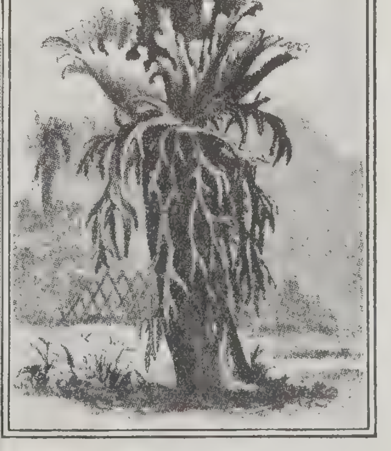


Urn of Nepenthes Distillatoria Plant. **On inner side of lid there are honey-glands *A*, that entice insect into urn, on whose inner wall there are glands *B* and *C*, which give off a clear liquid.**

The followers of Darwin claimed many new discoveries in the realm of meat-eating plants. Recent investigations have shown that it would have been more in keeping with the proverbial caution of science if these enthusiasts had spoken of their discoveries as types of *insect-capturing plants* instead of insect or meat-eating plants. Dr. Dubois's careful investigations, extending over a considerable period of time, have exploded the meat-eating plant myth of the Darwinians beyond resurrection.



Gland-hairs of the Drosera-leaf. **At left—Outstanding before irritation. At right—Closed after irritation toward source.**



Epiphyte Plant of South America. **This plant clings to the trunk of a tree which serves only as its support. It has no roots in the tree-trunk but derives its moisture from the air.**

The plant *Drosera* was the object of much early investigation which led to the conclusion that certain plants actually eat insects. This peculiar plant is provided with projecting hairs capable of emitting a glue-like secretion from their enlarged and bulb-like ends. Whenever the surface of a *Drosera* leaf is irritated by contact with an object, animate or inanimate, then the hairs bend toward and close over the irritating object. At the same time the glue-like secretion flows over the object. If an insect is caught in the hair-like tentacles of the *Drosera* leaf it soon becomes securely fastened within the leaf by the glue-like secretion. Death and disintegration inevitably follow. Professor Dubois has conducted many observations of the activities of the *Drosera* plant. "In vain," he states, "have I made numerous experiments to prove that the *Drosera* plant's victim dissolves in the same manner that an oyster does in our stomach."

The important rôle played by *enzymes* in the process of digestion is well known at the present time. An *enzyme* is a soluble ferment or organic compound which can transform or dissolve other compounds without undergoing permanent change in its own nature. Two important *enzymes* found in the stomach juices and in the intestines are *pepsin* and *trypsin.* Dr. Dubois has not discovered the presence of either in the glue-like secretion given out by the *Drosera* leaves. *Peptone,* another solvent present during digestion, could not be isolated from the *Drosera* secretion.

Professor Dubois, however, discovered various types of microbes and ferments in the body of the victim in sufficient quantities to cause its rapid disintegration. His researches also show conclusively that the microbes do not serve to make the *enzymes* active, as is held by some advocates of the *carnivorous plant theory* for the sufficient reason that the *Drosera* secretion contains no *enzymes.*

Another curious insect-capturing plant is the *Nepenthes Distillatoria.* Urn-like attachments are suspended from the extremities of its leaves. A lid opens and closes over the opening of the urn. The interior contains water together with a sweet liquid which attracts insects when the lid is open. In this substance they soon drown. The *Sarracenia Purpurea* plant is of the same general type as the *Nepenthes Distillatoria.* Professor Dubois's test upon these and many other alleged meat-eating plants have shown nothing but negative results. Microbes and ferments are the cause of the disintegration, and not animal digestion. Therefore, it is evident that meat-eating plants must be relegated to the realm of mythology.

An epiphyte plant is one which is attached to another plant in merely a mechanical manner and without any physiological connection. This type of plant derives its food from the air and does not extract nutrition from the plant which serves as its mechanical support. In the tropical countries many tree trunks are covered with various types of epiphyte plants.

Schimper has made an exhaustive study of these curious plants. Of the various classes designated by Schimper the so-called *cistern epiphytes* are the best examples of true epiphytes since the roots are used only for the purpose of holding fast to the supporting tree or plant and the leaves attend to the absorption of nutrition.

Many curious and weird stories have been told about the epiphyte plants. Most of them have no more factual foundation than the yarn spun by the traveler from Nicaragua.

BRIEFLY TOLD

A prominent American woman is making it possible for six British students to enter universities in the United States every year. She has founded scholarships at Princeton, Harvard and Yale for students at Oxford and Cambridge. It is to be hoped that the time soon will come when it will be possible to arrange exchange of students with all the enlightened nations of the world.

Grandfather clocks are being made by old established firms at Furtwangen and Lenskirch in the Black Forest of Germany.

Constantinople is said to be the noisiest city in the world. At frequent intervals night watchmen armed with long thick clubs beat heavily upon the stones of the street. Cats, dogs and wandering drunks make it almost impossible to sleep. Just before daybreak an army of food peddlers begins to fill the air with their clamor.

A "round robin" is a petition signed by a number of persons in circular form. By placing the signatures in a circle, undue prominence to any particular person is avoided.

The ancient game of polo had an illustrious history in the East before the British Army carried it home from India and made it fashionable in the British Isles and America. About A. D., 600, polo, which had traveled from Persia to Turkestan and Tibet, became popular with the Chinese where the women played as well as the men.

Character records are to be kept by Ripon College in Wisconsin to enable the college to carry out its plan of limiting student attendance to 500. It will be used as a basis of recommendation of the students in the varied activities of life. Good habits, loyalty, industry, initiative, good manners, respect for law and property value, good campus citizenship, and general good behavior will be credited to the student.

A Kentucky mountain girl, crippled with infantile paralysis, crawled on her hands and knees to school over a mountain more than a mile and a half away. The sharp rocks, despite pads, cut her knees so she could not make the trip more than a few times. A Louisville physician heard of the case and taking her to the city he operated on her. By breaking and resetting the bones in her legs he made it possible for her to walk in a year's time. She learned to read and write in the hospital and was taken to Berea College to finish her education. A man whose name is withheld deposited $1,000 to her credit in a Louisville bank.

The Japanese tallow tree bears nuts containing a rich tallow-like oil that is very valuable and is used in the manufacture of high-grade varnishes. Experiments carried out in the lower Rio Grande Valley prove the tree can be grown there.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

For the first time in history a woman has appeared on the floor of the Amsterdam Stock Exchange. She represents an Amsterdam firm of brokers.

To indicate historic spots on highways and roads in Quebec province, the Historical Monument Commission will install ornamental posts carrying a large maple leaf, on which, in English and French, the historical points will be mentioned. Should the government accede, the installation of these posts will be started this summer.

One hundred and fifty families are to be brought into British Columbia and settled under private enterprise in the valleys east and southeast of Fort George.

The Pike's Peak Turkey Growers' Association is an organization of women which embraces El Paso County, Colorado. Only a year old it already is doing a big business, shipping dry-picked turkeys in car lots. The association meets monthly and studies breeds, raising, marketing, and is purely co-operative.

The price of bread in Paris and the Seine Department is the highest that has been known since the siege of Paris in 1870. Bread is the chief foodstuff of the French population.

A rogues' gallery of insects is being organized by the American Nature Association in Washington. The pests are to be identified and information as to their migrations gathered together with the best methods of opposing them. Such insects as the Hessian fly and the boll weevil will no doubt head the list of undesirables.

Emmet Dalton, the last of the famous Dalton brothers' gang which terrorized the West a generation ago, says, "A dollar honestly earned is worth $10,000 obtained by fraudulent means." He spent 14 years in prison to expiate his crimes. He is a resident of Los Angeles.

The I. W. W. were on strike in Oregon and Washington during the latter part of April. The leaders of the organization told the men to stay away from booze during the strike. City officials were requested to "clean up" and when they failed to do so the direct-action squads of the striking I. W. W. swept through Seattle, Portland and Tacoma and, aided by the police department in some instances, cleaned out gambling dens, lottery joints and saloons. Proprietors of the establishments were warned not to open again under pain of more severe measures.

Steam heating in England is scarcely known. Even in the large hotels a guest wanting heat lights his own fire and pays the management from 50 cents to $1 for the privilege.

The population of Canada is about equally divided between city dwellers and country dwellers. The total urban population is given as 4,352,773 and the total rural population 4,435,710. In Prince Edward Island and Saskatchewan the rural population runs about seventy-five per cent of the whole.

The Moscow Conservatorium orchestra has played Beethoven's "Eroika" without a conductor. The Russian papers say that it was a great success.

Dartmouth College has determined not to accept more than 2,000 students. A limit of 550 is set for the freshman class. An attempt is being made to get a wide geographical distribution of students. Dartmouth wants a national, not a sectional college; a college of many groups, not of one type—a microcosm of the national life.

Raising queen bees brings a Calallen, Texas, man an annual revenue of more than $50,000, most of which is clear profit. Breeding queen bees is done partly by artificial means. He figures on obtaining about 100 queens from every hive of 2,000 to 3,000 working bees, instead of only one queen. Queen bees bring from $1 to $2.75 each.

A Reval bank has transferred $125,000 from Moscow Soviet State Bank to Berlin, consigned to M. Bronstein from L. Trotsky, Soviet war minister, according to press announcements.

No Indian, No Automobile—But Wait!

An Important Part of Motor Industry in Hands of Savages, and It Should Not Be

By LUTHER BURBANK

AN IMPORTANT part of the automobile business is still in the hands of semi-savages, who perform their tasks ignorantly, unscientifically and wastefully.

Engineers design the motors and erect the plants in which wonderful cars are built that would be worthless without rubber tires.

Indians and other half-savage peoples gather the crude rubber from which tires are made.

This would not much matter if nature had created the best possible kinds of rubber trees and the Indians knew enough not to kill them.

Indians often tap rubber trees until the trees bleed to death or are permanently injured as rubber-producers. A tree should have some rest between drains on its vitality; and if nature has produced a rubber tree that man cannot improve, it is the very first instance of the kind of which I have ever heard.

Man has improved every fruit, flower and grain that is now important to him.

Whatever grows in the wild state is likely to be pretty poor from the point of view of man's needs and desires.

The wild cherry was nothing until man made it something.

The wild potato was almost poisonous; it was ill-shaped, nonproductive and in no way adapted for use as food for civilized human beings.

Wild corn was but a grass with exceedingly hard, small, insignificant kernels.

The wild banana was but a solid bunch of flinty seeds.

The wild orange was so poor that it could not today be sold at any price.

Man has improved even the wild cucumber, which, as nature sent it forth, was unfit for food.

Nature has never produced anything that man has not been able to improve, says Luther Burbank in this important article urging experimentation with rubber.

This applies to thousands of other trees, shrubs, plants, grains, fruits and flowers.

Nature has not made an exception in the rubber tree; she has not produced a tree that man cannot improve.

A rubber tree can be produced in ten or twenty years that will yield more and better rubber than any tree that now grows on this earth.

I know this can be done because I know that the same natural laws rule in the jungle that prevail in the United States where I have worked for 60 years.

It is not that Man is wiser than Nature. Man merely has the advantage of knowing what he wants. That rubber trees can be developed that will produce more and better rubber is as certain as that natural laws operate everywhere, all the time, in the same way.

Rubber is obtained from a number of trees, vines and shrubs. Our common milkweeds produce a milk almost exactly resembling the latex produced by the various plants from which rubber is obtained, but the milkweed is too small to be of any commercial use, and the milk contains but a slight trace of rubber. It gives, however, a very good idea of the appearance of the rubber-producing latex, or milk.

Most of the rubber used in America comes from the valley of the Amazon, wild trees furnishing the bulk of the supply. The task of tapping the trees and gathering the latex is performed, almost wholly, by native Indians.

There are numerous rubber-producing plants in Central Africa, Mexico, the East Indies and even in the southwestern part of the United States where the guayale shrub grows spontaneously in some of the semi-desert areas. This shrub is also cultivated in California and Northern Mexico for the production of rubber. The rubber produced by the guayale plant is not so good as Brazilian rubber, but it is nevertheless suitable for use in various articles.

The best of all rubber, generally known as Para rubber, comes from the hevea tree which grows wild in Brazil. The usual method of obtaining this rubber is by making V-shaped slits with a sharp instrument along the sides of the trees. These slits converge at a point one above another so that the slowly exuding latex or milk flows into small cups attached to the trees. The average yield of a rubber tree, when thus tapped, is about two ounces of latex a day, one-third of the bulk of which is pure rubber. Curiously enough, if the latex be permitted to stand, the rubber arises to its surface as cream does upon a pan of cow's milk.

The average rubber tree produces ten pounds of pure rubber each year. It is not as simple, however, to gather the rubber as it is to skim the cream from a pan of milk. The latex is collected in buckets and brought into camp in almost exactly the ancient methods that have always been employed by the Indians. This is done by burning certain woods and nuts that make a smudge. A paddle is dipped into the latex, held over a slow, smoking fire, and as the latex evaporates a thin coating of rubber is left on the paddle. This process is repeated time and again until the paddle is heavily coated with fairly pure rubber. The rubber is then slitted from the paddle and is ready for the market where it is known as crude rubber. Generally it is the custom to plant a rubber tree or two wherever one in the primeval forest has been destroyed,

The rubber tree has, by selection, been improved to some extent, but not to one-hundredth part of its capacity for improvement. All individual plants growing on this earth have slight differences in their growth and capacity for producing substances valuable for the use of man. The longer plants are cultivated by man, and especially under varying circumstances, the more new varieties appear.

Even in its wild state, the rubber plant is quite variable, not only in its growth, but in its capacity to produce latex and the proportion of rubber in the latex.

By careful scientific selection from a large number of seedling trees, new varieties of superior excellence could be selected quickly. Among the seedlings of these best growers and producers still greater variations of importance are absolutely certain to appear. Thus, step by step, the rubber plant of the future will be produced.

This will require such patience and application as few men under government employ are willing to give or capable of giving, yet this work is altogether too expensive for an individual to expect to obtain from it reasonable remuneration.

It is wholly impossible for me to visit the tropics or to leave my home experiments under any circumstances whatever; but if I were commissioned to improve the rubber plant, I should first make a very comprehensive search for the best individual, all-around plant that could be found.

From this plant I would raise a great number of seedlings, and after two to five years' growth, make a few selections from the large number raised.

I would scientifically test their individual capacities, and from one or more—not many—would endeavor to hasten seed-production, so that the next grand step in selection might be available as soon as possible.

This process would be repeated, again and again, until the desired result was obtained. The same methods made the sugar beet what it is. The best sugar beet used to produce only six per cent of sugar. It now produces from twenty to thirty-six per cent.

The rubber tree cannot, perhaps, be improved as rapidly as the annual beet, or at as little expense, but the result is certain. If the demand for rubber continues to increase, it will very soon be necessary to improve the rubber tree.

In a way, it seems strange that so little has yet been done along this line. So much attention has been paid to improving the quality and decreasing the cost of every other part of the automobile. The best brains obtainable have been employed to produce the required qualities of steel, to design the most efficient motors and to extract more and more of the valuable elements of coal, but the crude rubber business has been left in the hands of semi-savages, notwithstanding the fact that without rubber tires an automobile would not be worth much. The Germans, during the war, made tires of springs, but they went back to rubber as soon as they could get it.

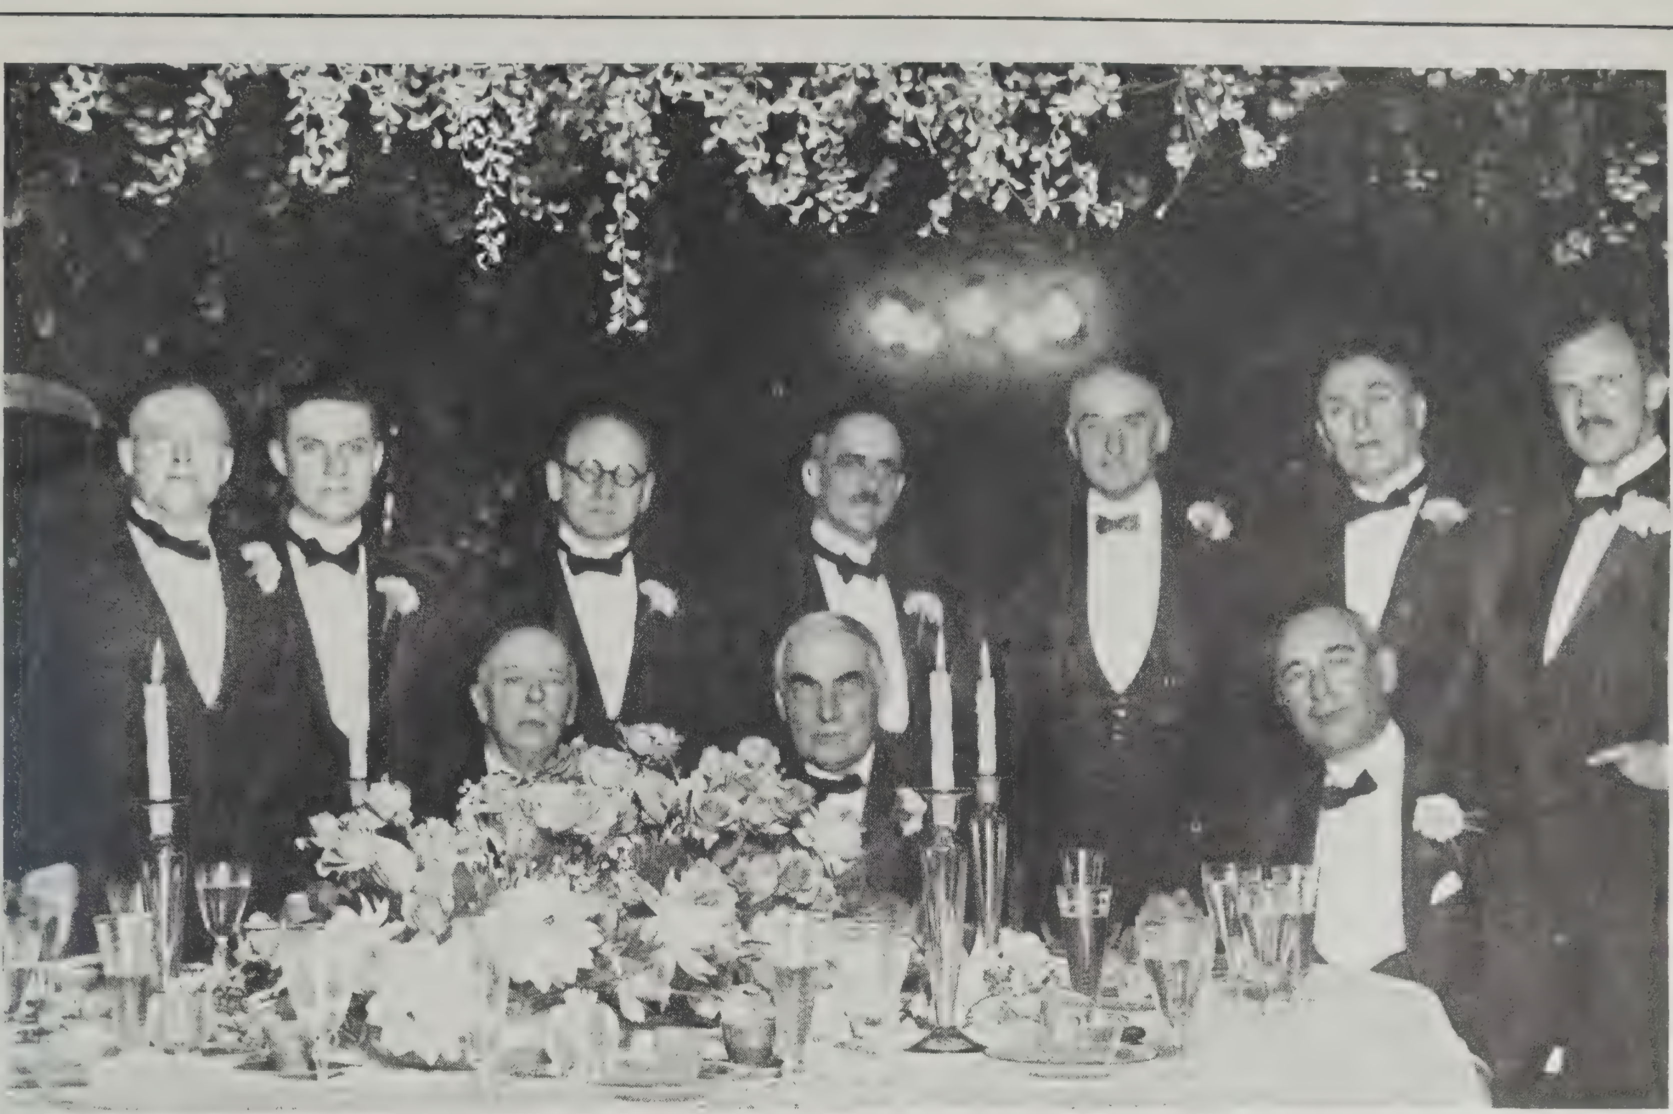
But industry usually goes ahead on one foot. Pressing tasks are performed first. Wild rubber trees were numerous enough and productive enough to meet the requirements of the automobile industry for a while, even when Indians tapped the trees and gathered the latex. But a wild rubber tree is as much an absurdity in a civilized community as a wild apple tree. It will be compelled to give way to a better tree.

Trees, shrubs, plants, grains and flowers can be led along any reasonable line of development. It would not be reasonable to expect a tropical tree or plant to live if quickly transported to a temperate or arctic climate, but if a yellow flower, for example, has a tinge of red in it, the whole flower can be turned red. I once developed a walnut tree, all the limbs and branches of which lay flat on the ground. I produced a walnut tree that grew at tremendous speed. The ordinary walnut tree adds each year a circle of wood about as thick as a thin sheet of pasteboard. The tree which I have adds a circle of wood an inch thick each year. This was accomplished by crossing a California walnut tree with an English walnut. The California walnut, accustomed to a dry climate, sends its roots deep into the ground. The English walnut, accustomed to a moist climate, has no need to go deep, but spreads its roots over a great area. The tree thus developed combined these tendencies, sending its roots both deep and over a great area. Of course this result was not obtained immediately by crossing the two species. It was necessary to make many thousands of selections through a long series of years to get this wonderful tree, which can now be multiplied to any extent desired.

A wealthy Japanese silk grower and dealer visited me a few years ago and commissioned me to produce a mulberry tree, the leaves of which should be of increased size. In three years I had a tree bearing leaves five or six times as large as the largest mulberry leaves hitherto known. Inasmuch as the silk industry is based upon what the silkworm can eat from the leaves of a mulberry tree this was something like multiplying by five or six the acreage of Japan and all other countries that are suitable for mulberry tree culture. This will be the effect, at any rate, when the new mulberry tree has displaced all of the old mulberry trees.

As necessity compels us to do so, we shall more and more develop trees, plants, grains and fruits to serve particular purposes. We shall produce, for instance, rapidly growing trees for conversion into pulp from which paper is made. Printing presses are eating up our forests. It is not likely that the presses will stop, nor is it more likely that trees, left to themselves, will increase the speed of their growth. But man can develop trees suitable for paper-making that will grow to suitable size relatively quickly.

Mr. Edison has framed in his office a quotation from somebody to the effect that "Man will resort to almost any expedient to avoid the pain of thinking." That is largely true. It may therefore be a good thing for the world that British interests have monopolized the supplies of crude rubber and increased prices in a manner that is more or less alarming. As a result, in a few years, we shall probably have better rubber trees, more rubber and better rubber.



"The decorations were costly." The banquet at the Hotel Hamilton, Washington, D. C. (C) Int. Newsreel Corp.
Standing, left to right—Commissioner F. I. Thompson; Asst. to chairman, Ralph Sollitt; Commissioners Meyer Lissner, E. C. Plummer, W. S. Benson, T. V. O'Connor; the new chairman, E. P. Farley.
Sitting, left to right—Commissioner George E. Chamberlain; President Harding; the retiring chairman, Albert D. Lasker.

A Modern Disraeli

By a Washingtonian

"And as the Cock crew, those who stood before
"The Tavern shouted—'Open then the Door!
"'You know how little while we have to stay,
"'And, once departed, may return no more!'"

—*Omar Khayyam.*

"ALTHOUGH the party was small, the decorations were costly, these and the favors alone costing more than $1,000. When the guests stepped from the elevator they found themselves in a small bower bordered with cedars that lead into a reception room, the walls of which were hidden by latticework intertwined with quantities of pink rambler roses. Banked about the walls were palms, ferns and hydrangeas, in great abundance.

"The chandeliers were hidden under arrangements of rambler roses and other flowers, while in the center of the room was a huge earthen jar filled with American Beauty roses. Banked about the bottom of the jar were ferns and hydrangeas.

"The table was spread in the adjoining room, which was converted into a rose garden, with walls and ceilings entirely hidden by lattice, covered with wistaria. The corners were banked with cedars, palms and ferns amid hydrangeas, while soft moss covered the floor.

"All around the table was a formal flower garden with blooming hydrangeas, peonies and other early summer flowers and ferns, while an electric fountain played in one corner of the garden.

"Tiny amber and blue lights twinkled through the rose canopy overhead, giving the effect of a starlit sky.

"The table itself was one solid mass, from center to handsome dinner plates, of pink roses and pond lilies.

"Flitting about were servants garbed in quaint colonial costumes of white silk with lace frills and silk stockings, all made specially for the party."

Make Way! Make Way! Disraeli Comes—
And Oh, Yes! the President Too!

THUS runs the newspaper account of a party at the Hotel Hamilton, in Washington, D. C., the night of June 15.

"Each Morn a thousand Roses brings, you say;
"Yes, but where leaves the Rose of Yesterday?
"And this first Summer month that brings the Rose
"Shall take Jamshyd and Kaikobad away."

But nobody was thinking of those lines from the Rubaiyat.

And as one gazes at the photograph of that party, the dark liquid in some of the old-fashioned wine glasses, the water showing white in some of the others, one wonders if it was grape juice served in the glasses which recalls the memories of other days—for grape juice photographs black, too, or whether in the words of the Rubaiyat—

"—David's lips are lockt; but in divine
"High-piping Pehlevi, with 'Wine! Wine! Wine!
"'Red Wine!'—the Nightingale cries to the rose
"That sallow cheek of hers to incarnadine."

But nobody tells what was in the glasses except the photograph—and it isn't specific.

Who were the bride, the groom, you ask, the bridesmaids and the best man?

Oh, no, this was not a wedding party at all, albeit the description of it reads like a marriage banquet in high society.

There was no blushing bride—instead there was the modest, blushing Albert D. Lasker, Modern Disraeli, Chicago advertising agent, Chairman of the Shipping Board, just turning over his gavel to his successor "who will carry out my plans," Edward P. Farley.

Instead of the nervous groom, there was the President of these United States, Warren G. Harding, paying adulation to the advertising agent and self-styled "business man" from Chicago, Lasker.

The Modern Disraeli, foregoing the oddities of dress, the lace, the frills, the knee breeches and silken hose of his famous forerunner, turned instead to the exotic flowers, ultra-extravagant foliage, cedars (were they Cedars of Lebanon?) and playing fountains. But the lace, the frills, the knee breeches and the silken hose had to be somewhere in the picture, so the waiters wore them.

Here was no queen receiving the adoration of her Disraeli, the while her worried lords are being slowly but surely edged from their places in her heart and confidence by the wily trafficker in soft words and flattering phrases of undying devotion to her cause.

But—

There was Warren G. Harding, President of these United States, lauding the Modern Disraeli, and in turn being flattered by him, while Harry Daugherty, broken in body, disconsolate in mind, abandoned, and Herbert Hoover, disgruntled, fearful perhaps, disappointed certainly, and the others—were where? Not at this Jamshyd's feast of the Seven-ring'd Cup wherein the destiny of the Seven Heavens, the Seven Planets and the Seven Seas was but darkly hinted at.

Now read a little further account of this feast of riotous oriental splendor under the lotus blossoms.

"Directing his remarks to Mr. Lasker, President Harding said:

"'Mr. Lasker has insisted that he should retire. I say to you frankly that it was with very great reluctance and after repeatedly and sincerely requesting him to remain, that I consented to his retirement.'"

Again, in the words of the Tentmaker, it would seem that—

"A Book of Verses underneath the Bough,
"A Jug of Wine, a Loaf of Bread—and Thou
"Beside me singing in the Wilderness—
"Oh, Wilderness were Paradise enow!"—would be about it.

And how vividly does that recall to those who know those earlier days at Wardman Park Inn when twice a day at least the booming voice of the Modern Disraeli would order his coachman—or was it the chauffeur—"To the White House!" while great and near-great ladies and gentlemen looked at one another in wonderment—and at Mr. Lasker in awe.

A Rebuke for the Faithful Daugherty;
An Advertising Agent "Sells" Second Term

APPARENTLY the President's heart was broken over the bereavement in his official family. The while the shrinking, modest Modern Disraeli, advertising agent from Chicago, "shrunk" a little more as his countenance was o'erspread by the pink of sweet confusion—or was it glee over the success of his Disraelian wooing of a President of these United States?

The modest Mr. Lasker, recovering his composure, was able to rise to his feet, and, blushing the more furiously because of the open admiration showing in the eyes of the President, the members of the Shipping Board, the new chairman, Farley, the secretary of the White House, Christian—queer name, that, at this feast—and the other adoring ones, the Modern Disraeli was able to say:

"I don't see any hope for Americans in the future without a merchant marine. It isn't much of an honor in the eyes of the public to be on the Shipping Board. But there is no job in the country I could ever hold higher. It was the greatest

Whither Bound?

UNCLE SAM counted noses in 1920. The facts of the count are now available, and they are an interesting commentary on the present-day scheme of things.

Partially owing to the effects of the war, the tendency is decidedly to concentrate in the cities. Fully one-third of the counties have lost population, and this population is more than accounted for by the enormous increases in the cities. The western migration is also effectually supplanted by this mad rush to industrial centers.

The overwhelming number of women engaged in industrial pursuits, as wage-earners, is a new situation in the annals of the world. A century ago practically no women were employed in any work other than domestic service.

Increase of Negro population is 6.5 per cent, the lowest increase so far recorded. In the North, Negro deaths outnumber births, whereas in the South, except in the Southern cities, the reverse is the case.

Statistics indicate that the American Indian will become extinct at no far distant date except where this is averted by intermarriage, in which case Indian tribal relations and customs will disappear.

Japanese and Hawaiian immigrations show an arrested increase.

Whether these changes are for better or for worse is yet in the realm of the vast unknown, but it is mighty well worth watching.

Bankers Criticize Reserve System

WHEN, some years ago, Paul M. Warburg remarked that, while the Federal Reserve Act of 1913 contemplated something vastly different, the Federal Reserve Board had been able, through its administration, to make of the system what he, its originator, had intended, he spoke by the card.

With business approaching normality, with commerce and industry less dependent on credit, with banking profits consequently decreasing, there is an increasing protest against the subversion of the intent of the law and the autocratic power of the Board.

Under the significant title, "Federal Reserve System of Banks, or Government Banks?" Charles de B. Claiborne contributes to the June 1 issue of *Banker and Financier,* a virile paper which is unmatched in its criticism of the system by any so far offered from outside the pale.

Mr. Claiborne is vice-president of the Whitney-Central National Bank of New Orleans, and chairman of the "Committee of Five" of the American Bankers' Association. No further evidence of his representative character and high standing is necessary.

Mr. Claiborne launches his attack:

> "The great question before the American banker and business man today is 'Do we want a Federal Reserve system in strict compliance with the intents and purposes of the Federal Reserve Act as adopted and passed in 1913, or do we want a system of Federal Reserve or Government-owned and operated banks?'"

Theoretically owned by the stockholders, the member banks, Federal Reserve Banks, declares Mr. Claiborne, are controlled and dominated by the Federal Reserve Board, which easily makes all the regional banks mere branches of the central authority at Washington. He says:

"We might as well face the situation as it is and be honest about it, and tell the truth, the whole truth and nothing but the truth. The time for evasion and dealing with technicalities has passed. We must have unanimity of opinion and action with regard to our Federal banking system. A system whereof less than one-third of the thirty-two thousand banks of the country are members will not give us the necessary efficient and financial machinery the present Federal Reserve Act was intended to give. We may investigate why more banks have not joined the system, and Congress may appoint a committee to look into the causes why there are so few members, but the small membership itself tells more than any man or set of men can hope to explain or justify."

But for the forced and violent conscription of all National Banks into the system, Mr. Claiborne avers, less than ten per cent of the banks of the country would now be members of the system. There must be more than one reason for this, more than a fear of the autocracy of the central authority, and the fact demonstrates that the chief reason is the system is not functioning as it should.

The sole excuse for the system, and the theory advanced to secure its establishment, was the creation of an agency with power to "expand and contract the currency" to meet the demands of business. It was not intended to establish a system of government banks, according to the essayist, who follows with praise of the old National Bank system as an institution of proved worth.

The remainder of Mr. Claiborne's article is an elaboration of the criticism in which are detailed several instances of unwarranted abuse of the power assumed by the Federal Reserve Board, and needs no comment.

The President En Tour

PRESIDENT HARDING in his swing across the continent has been accorded a fine personal reception marked by the customary respect of the American people for the Chief Magistrate of the nation. But if reports of discerning observers are to be credited, the President is feeling more than ever before his inability to convince the mind of the people that he holds the solution of any of their problems. In fact—and this is the bottom fact—the President is not himself convinced that he holds the solution. He is *not* convinced. He feels in himself a lack of knowledge which all his advisors have been unable to supply, and he feels in himself a lack of personal power. Be this said to his credit—he is too honest a man to pretend that he believes he possesses personal powers which he knows he does not. That is to say, in common slang, the President does not put on a "front."

The outward and visible sign of all this is the fact that the personal reception given to the President was most cordial, but when he began to expound his ideas (which may hardly be said to be his ideas, but those of an equally incompetent group around him) dead silence fell on the assemblages. As this is being written, only once did the President rouse his auditors to applause and that was when he stated that he was as much against the League of Nations as he was when a Senator. That statement was applauded, as doubtless it would be in most political audiences in any part of the country. Even that applause cannot be credited to the approval account of any of the President's policies, because the League of Nations is not an issue in this campaign. But the President's World Court plan is an issue, and when he proposed that there was no response.

The silence was not the silence of an assemblage thinking. It was the silence of those who instinctively felt that the right key had not been found. The mind of the people will know the moment the right thing is said. It becomes more and more apparent that that right word, that right key has not been committed to Mr. Harding. He is serving through a period when, possibly, it was destined that nothing should be done. If Providence, foreseeing a fallow period, chose one who would not be required to initiate the planting of the new harvest, Mr. Harding was an excellent choice. And this comes near to being Mr. Harding's personal feeling about it. He does not talk of anything new. He feels within himself that the new period of the country will not begin with him. He would have been very content to have gone on without proposing to the nation his plans for a World Court or for the grouping of the railroads, but his advisors insistently dinned into his soul that something had to be provided for talking effect in the next campaign. And so these several policies were concocted out of several sets of ideas and according to the minds of several sets of political advisors. If the President seems somewhat wearily to lend himself as their mouthpiece it is only the natural feeling of a man whose whole heart and conviction is not in what he advocates. In a way it is sympathy that Mr. Harding deserves rather than censure.

Another Woman Speaks Out

THE women writers of the country are braver than the male masters of the pen in discussing the alien racial influences which endanger the character and ideals upon which this republic is founded. The reason for this may be that moral courage in women is seldom even temporarily inhibited by prudential considerations. Of course, there are also the publishers, who are males, without whom the women writers could not get very far with their work, and the publishers' willingness to broadcast the brave utterances of the women writers is to be accounted for probably by the fact that the women writers have handled the question better than have most male writers, with fewer if's and and's, without apology or straddling, and with a full appreciation of the facts.

In the March, 1922, number of *The Bookman,* Gertrude Atherton had an article on "The Alpine School of Fiction" which described the alien influence in our literature. In the January, 1923, number of *Harper's Magazine,* Katherine Fullerton Gerould had an article entitled "Freedom in 'The Land of the Free'" in which she described the break-up in American unity of thought and actually used the word Jew. And now in *The Bookman,* June, 1923, comes an article by Mary Austin on "Sex in Literature." These three articles should be bound together and scattered over the country; certainly they should be secured and read and studied by every American who wishes to understand what has occurred in this country.

The latest of the group, Mary Austin, traces (as did Gertrude Atherton) the whole difficulty to racial sources. The rise of the sex motif in our literature she traces to the influx of people from Eastern and Central Europe. She discusses the Jewish mind with entire accuracy, not denouncing but analyzing it and in some respects accounting for it. The Jewish writer, man or woman, cannot help taking the course he or she does in emphasizing the lower elements in human relations, because that is the heritage of what Mary Austin calls "the dark-whites." Sex, as sex alone, as distinguished from the Anglo-European's conception of *love,* is the dark torment of those races, which leads Mary Austin to say:

"The avidity with which the Jewish intellectual in particular has seized upon psychoanalysis emphasizes a need of proving that everybody is as full of secret troubling as himself, a need which could easily arise out of a lack of that intensity of experience it undertakes to demonstrate." "Sometimes I suspect that this engagement of the love interest with the secret forces of the dark only appears to be Semitic because here in the United States we are for the moment confronted with Semitized examples of it."

There are other things in this article of great value to people who want highways for their thought about modern books. Puritanism, so-called, is discussed; Mr. Galsworthy, Theodore Dreiser, Joseph Hergesheimer, Ben Hecht, Sinclair Lewis, Sherwood Anderson, and others.

It is brave work bravely done and not "anti-Semitic" any more than any other fair view is "anti-Semitic." Mary Austin knows exactly what she is writing about.

In this connection we may call attention to a discussion of racial lines in sex as discussed on page thirteen of THE DEARBORN INDEPENDENT for June 30—a recent issue—entitled "Naturalism and Sex Slavery." This is another evidence of the sound thinking which is steadily overtaking the "dark-white" propaganda that recently swarmed through our fiction-writing world.

After the "Dirt Farmer," What?

HISTORY is repeating itself, but with a difference; a difference due to the trend of the times. Former Premier Stamboulisky, the "dirt farmer" of Bulgaria, was recently overthrown by a handful of daring plotters, generally agreed to be Fascisti of that country. The incident is not unlike the overthrow of the government of France in 1851 by Napoleon.

Stamboulisky was as truly dictator as Lenin or Mussolini. He was peasant leader against the Crown of Bulgaria; during the crisis of 1915 he was jailed by King Ferdinand, and when Ferdinand fled in 1918, became premier. He set up a farmer government, arraying the farmers against the city folks, and applied compulsory labor for the state to all Bulgarians.

Of prime importance, Stamboulisky is believed to be a tool of Germany and Greece. His overthrow, consequently, augurs a realignment of Balkan powers.

Mr. Ford's Page

THERE are too many people whose whole business is the organizing of committees and the starting of new movements and the erecting of new temples to this or that idea. The multitude of "workers" for various associations bent on saving the world, the armies of secretaries for various "good causes" are very impressive; they give one the impression that the overhead must be rather heavy and that no small part of the zeal displayed must have its source in an anxiety lest the good work fail for lack of contributions.

When one succumbs so far as to attend the meetings of the various causes and hear the representatives of the various movements, one gets a sense of chaos which no other modern operation gives, no, not even the operation of our Government. For Government, however inefficient it may be, is at least held together by the political necessity for continuity, whereas in these other matters there is no unity nor continuity.

THE time for slogans and platforms and promises is gone. Past performance is the best promise and the best platform. It has not been the promisers but the Doers who have held the country steady through three decades of political gas-making. Words that have meant nothing have satisfied the people until recent years, but now words and promises have lost their power. Too many programs lie unrealized along the political highway for the people to trust in promises any more. It is not merely action the nation demands; political jumping-jacks have given them "action" enough; the nation wants achievement, something actually accomplished and established forever. Every year the United States should be getting through with some problem. Instead of that we have been making problems faster than any statesman has been able to list them.

It is desirable of course that animals be protected from cruelty, that orphans be cared for, that education be given, that ideals of peace and so forth be spread abroad—these are some of the broader and older operations of the welfare spirit; but when the work of true charity (in the old-fashioned sense) is separated from the faddism of these later times, every fad being attached to a salary list, it will readily be seen that the necessary common-sense things form a very small minority. Take any list of so-called "good works" and you will discover that the majority of them are fads. You may discover also that the fads are, as a rule, the best supported, probably because they are the best collectors and possibly for the additional reason that they fill the minds of their supporters with radiant dreams of dazzling things-to-be rather than harrow them with realistic tales of things as they are.

Many people are willing to bet on the rainbow, who would not begin to clean up their own farm or back yard. It is human nature, and some clever people trade on it. But progress never began at the rainbow yet, it always begins at the next step, and the next step may possibly be through the litter which we ourselves may have created.

So that it would be quite proper with many of the movements which masquerade as world-saving works, to put them in the class of paid entertainments. They entertain their patrons with visions.

This method of employment exists in America more than anywhere else in the world. Yet it is an Old World importation. It was in the Old World that people were taught to amuse themselves and occupy themselves and otherwise render themselves harmless to the ruling powers by organizing themselves into groups for purposes which differed as widely as the stars. And the more enthusiasm the group could generate the safer they were as far as concerned an intelligent view of their general political and social condition.

It is always easier to handle people who are thus organized. Politicians know that. Tyrants in all ages have known that. A few who did not know that and who tried to prevent it, whether it went under the name of "the right to peaceable assembly" or anything else, lost their positions. Even an assembly organized against a ruler is more easily tractable to his wishes, if he be a shrewd man, than is an unorganized mass. It is the disorganization of American politics today that the politicians most fear. The people are not lined up. The people are never more in command of the field than when in just that situation.

The time came, however, when in the Old World the necessary energy and finances for the gentle game of organization were not forthcoming. National life itself became so well organized or regimented that the field of the private leaders and secretaries and organizers became limited, and by some magic the whole business leaped the sea and settled here.

There came so many organizations whose roots were in foreign soil and in foreign ideas that the country resembled more a gathering of alien camps than a united nation. And it has not become united yet for the reason that those who keep the various organizations together also manage to keep them apart. Thus they are controlled one by one, by this prejudice or that, and sometimes by opposite prejudices on different occasions, and whoever the Chief Group is, it gets in its work under cover of the general confusion.

In this country, organization has taken a different form. They are principally reform organizations now. They are going to stop this or that abuse, and they are going to start this or that virtue. There are great organizations of women in this country whose stated purposes are most admirable but whose very existence is for the sole purpose of enabling a few women residing in Washington to speak of "the ten million women I have behind me." And it enables worse occurrences than that—it enables threats to be made if certain men do not come across oratorically or financially the way these "leaders" demand; and it also enables promises, which are bribes, if they do.

There is often all the difference in the world between the stated purpose of an organization and its actual achievements. It amounts almost to a game these days to satisfy the people with a fine array of words, and then go on and do what you like. The American people have been so satisfied with mere programs that they have been given little else. The program-maker, the slogan-coiner, the "standers at Armageddon" and the "battlers for the Lord," these have so filled the eye and the ear of the populace, that it is not until years after that people wake up and find that nothing has been done about it.

Think over the rosy promises of the last fifteen years. Think over the list of the self-appointed saviors of the country who have warmed and thrilled the people by their words concerning Justice and Progress and Humanity. Think over the number of times the people have been soothed and led by mere words of charming sound. And then look at the wrecks of all these fine programs. Their purpose never was achievement; their purpose was solely that of slogans, to oust someone out of office and to boost someone in.

The result is that all the programs are used up, all the fine words have become stale, all the visions have proved to be disappointments; and now the organizers and orators and spellbinders are up against the simple proposition of actually doing something that counts.

It is a great day for the Doers; they are going to have their inning now.

You can only organize the Doers around the job, a job big enough to engage them all. You don't organize Doers around a speech, or a printed platform, or any effort to arouse enthusiasm for an ulterior purpose. That has been the curse of the organizers of the past—their ulterior motives. It was seldom the job they wanted, but the place at the head of the job. Their heart was on preferment, not on opportunity for service.

Well, we have done with that. All through the country, in practically every organization, the people are asking, "What are we here for? What good does it do to keep the organization running? Of what use is a motor that only supplies sufficient power to turn its own wheels? Is our organization an end in itself, or is it a means to some other end? What is our justification for living?" Talkers are being sent to the rear; Doers are coming to the front.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Breaking Down the Immigration Barriers

Forces Aligned Against the Exclusion Laws Aim to Incorporate Diseased and Degenerate Aliens Into American Stock

By CHARLES ALBERT COLLMAN

COMMISSIONER ROBERT E. TOD, of Ellis Island, in a previous article, showed how, through the misguided efforts of certain lawyers and politicians, a stream of defective immigrants was being introduced into this country to taint American life. He illustrated the methods adopted by those who are trying to frustrate the immigration laws by citing the cases of the Sas family and that of "Sammy" (Smull) Goldman. There follow here other instances of a similar character, revealing how immigration officials, who are trying to perform their duties, are hampered and attacked by the forces aligned against the exclusion laws, designed by Congress for the protection of the United States.

It is through the persistent maneuvers of the above-named forces that the system of bonding immigrants has been made a farce. While a few of the bonded aliens, who have been permitted to enter the country temporarily, are later found and deported at considerable expense to the government, a large number eventually enter public institutions, where they become permanent charges upon the taxpayers. Innumerable instances can be mentioned in which the Department of Labor was induced to admit "for treatment" mentally defective women, or those suffering from incurable or hereditary diseases, who have within the period of the bond had children, many of them marrying American citizens, thus incorporating into American stock a defective mother and a probably defective child. According to experienced authorities, the vast majority of dependent aliens in the state of New York are directly or indirectly chargeable to the iniquitous practice of admitting such prohibited classes under bond. It has been shown recently that one-fourth of the insane are foreigners and cost the state more than $4,000,000 a year.

The Fink Case Citea

"NEVER," said Commissioner Tod, "in the history of immigration affairs at Ellis Island, has the Public Health Service here been treated with such contempt, nor have medical certificates been subjected to such ridicule and disrespect. If these certificates by reputable psychiatrists (and if they are not, I do not purpose while I am here to exclude aliens and fine steamship companies on their certificates) are going to be attacked by attorneys and Congressmen, then the immigration service presents a spectacle that is worse than ever before known. Not only have immigrants been permitted to have attorneys appear before the Board of Review, although the law does not so specify, and the evidence ignored that has been taken by boards of special inquiry here, who have been designated by Congress to examine the aliens and take evidence; but now the very framework of the law is being tampered with by politicians, and every barrier which Congress erected for the protection of the United States, namely, the right of examining public health surgeons to certify for exclusion mandatorily excludable cases, torn down. In a recent interview, Congressman Johnson urged that the strictest adherence to mandatorily excludable cases be made, and the New York State authorities are fully alive to the conditions, and other states are going to hold conferences on the same subject."

The commissioner mentioned the case of Pauline (Paja) Fink, as one in which probably a precedent would have to be established to prevent like reprehensible practices in the future. "This case," he said, "calls for a thorough examination. A most unusual procedure has been adopted in this Fink case which, if permitted to continue, will inevitably disrupt the morale and good administration at Ellis Island. It is another case in which a certain Congressman is interested, and he appears to have been able to block deportation at every turn."

The Pauline (Paja) Fink case, as will be seen, is of a peculiarly scandalous nature, and the schemes of obstruction and law violation have been permitted to be continued for more than two and one-half years.

On December 2, 1920, the Fink girl arrived in this country, and was at once certified as being feeble-minded.

December 20, 1920, a re-examination was ordered at the request of Congressman ———. The first medical board was composed of Drs. Wildman, Slaughter and Roberts. The second medical board, at which an outside physician, representing the alien, was present, consisted of Drs. Wildman, Travers and Bell. The certificate of feeble-mindedness was reaffirmed, and an additional certificate of "deaf-mutism" was rendered.

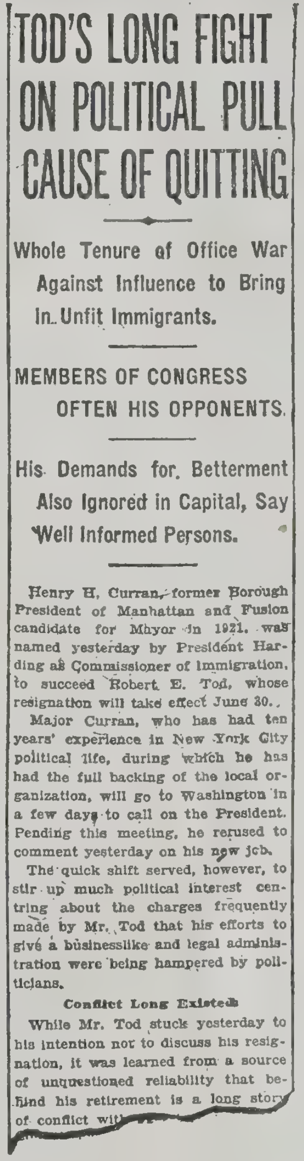
On January 15, 1921, despite these two examinations by five Public Health Service examiners at Ellis Island, this defective alien was admitted for six months under bond.

On July 20, 1921, a stay of sixty days was granted, with the privilege of a rehearing at the end of that time. In the meantime, a propagandist campaign was begun on behalf of this deficient child in the newspapers, as is being done with respect to "Sammy" Goldman, Joseph Schwartz and other defective children who belong to the excludable classes.

On September 28, 1921, the girl was re-examined for the third time by Drs. Wildman, Loughran and Richardson, and the previous two certificates were reaffirmed. By this time the Fink girl had been examined by seven Public Health surgeons.

On October 10, 1921, the Department of Labor refused to extend the temporary admission of this alien, and directed the bondsmen to deliver her for deportation in accordance with the terms of the bond.

On October 26, 1921, through the Congressman's influence, the girl was, however, examined once more, there being present another physician representing the alien, who had no special training in psychiatry or mental defect. The board consisted of Drs. Wildman, Loughran and Travers. These examiners had observed the child from time to time, and were especially well fitted to pass upon her mentality. They were able to find no change in her mental condition and affirmed the certificates of December 2 and 20, 1920, and September 28, 1921.



THE WORLD: WEDNE

TOD'S LONG FIGHT ON POLITICAL PULL CAUSE OF QUITTING

Whole Tenure of Office War Against Influence to Bring In Unfit Immigrants.

MEMBERS OF CONGRESS OFTEN HIS OPPONENTS.

His Demands for Betterment Also Ignored in Capital, Say Well Informed Persons.

Henry H. Curran, former Borough President of Manhattan and Fusion candidate for Mayor in 1921, was named yesterday by President Harding as Commissioner of Immigration, to succeed Robert E. Tod, whose resignation will take effect June 30.

Major Curran, who has had ten years' experience in New York City political life, during which he has had the full backing of the local organization, will go to Washington in a few days to call on the President. Pending this meeting, he refused to comment yesterday on his new job.

The quick shift served, however, to stir up much political interest centring about the charges frequently made by Mr. Tod that his efforts to give a businesslike and legal administration were being hampered by politicians.

Conflict Long Existed

While Mr. Tod stuck yesterday to his intention not to discuss his resignation, it was learned from a source of unquestioned reliability that behind his retirement is a long story of conflict wit

October 28, 1921, the bondsmen were again notified to effect the departure of the alien. They ignored the notice, and were given until November 14 to comply with the terms of the bond.

November 21, 1921, the Immigration Bureau was notified that the bondsmen still ignored the deportation order.

November 25, 1921, the bond was declared breached, the penalty forfeited and the bondsmen called upon to pay the amount involved. At the same time a warrant of arrest was issued for the alien, who was stated to be in this country in violation of the law.

December 17, 1921, the relatives of Paja Fink again frustrated the law and had the proceedings stayed by giving a departure bond of $1,000, the deportation to take place in ninety days, representing *that an operation was necessary.* The stay was granted upon the express condition that the relatives must prepare to arrange for the departure of the child unless her cure was effected and a certificate had from the United States Health Service thirty days before the expiration of the stay.

February 15, 1922. The aliens, their relatives and friends, again circumvented the government and engaged two physicians to attend another examination. This was the fifth one held. The board consisted of Drs. Wildman, Love and Shockley, making a total of nine psychiatrists that had examined Paja Fink. Again the previous certificates were reaffirmed. Dr. Wildman, who sat on these various boards, is now assistant at the Bellevue Hospital psychopathic ward, and is considered to know a feeble-minded case when he sees one.

March 21, 1922. **Through further pressure brought upon the Department of Labor, final decision was deferred in the Fink case for one year.**

May 9, 1922. The bondsmen applied for remission of the forfeiture of the bond, which had been declared breached.

March 20, 1923. It was decided that if the deportation of the Fink girl was not effected within a reasonable time, a warrant of arrest should be issued.

March 22, 1923. The deportation was delayed pending the outcome of the girl's examination by the Public Health Service in Washington.

May 9, 1923. The Fink girl was examined for the seventh time at Ellis Island and again certified for feeble-mindedness and deaf-mutism.

How Facts Are Excluded

WHEN I asked Commissioner Tod for the name of the Congressman who has been the chief mover in all these proceedings, he replied that he was not prepared to name either the politicians or the lawyers who were active in these cases.

Several days after my talk with the commissioner, however, a propagandist story appeared in the New York *Times* (May 12, 1923), headed:

> **TO FIGHT DEPORTATION OF DEAF POLISH GIRL**
>
> **Congressman Nathan D. Perlman announced yesterday that he proposed to fight any attempt to deport fourteen-year-old Pauline Fink, of 101 Mangin street. He said he had telegraphed to the Department of Labor requesting that action on the report be held up until he could personally appear before the officials in Washington next week. Meanwhile, he said he would have a further examination of the girl made by medical experts.**

In this news story, the foregoing official facts regarding this scandalously long-drawn-out case were carefully excluded.

Through methods such as these, the public schools in New York City have been filled with defective children of foreign birth to such an extent that *special classes have to be maintained for the subnormal and feeble-minded.*

Thomas B. Felder, of the New York law firm of Felder, McCrossin & Chorosh, has displayed a bitter animosity against Commissioner Tod because of the stand the latter has adopted in trying to prohibit the entrance into the United States of defective aliens. It will be recalled that Felder's name was mentioned on the floor of the United States Senate, a year ago last May, when Senator Caraway, of Arkansas, criticized the means adopted in obtaining the release from the Federal penitentiary, at Atlanta, of Charles W. Morse. Senator Caraway stated that Thomas B. Felder, now of New York, but formerly an Atlanta lawyer, had visited him and sought to assume full responsibility for what was done in obtaining the pardon of Mr. Morse by President Taft.

"Is this the same Felder who was indicted in South Carolina?" asked Senator Caraway, addressing Senator Watson, of Georgia.

"He is the same man," replied Senator Watson.

"And that," observed Senator Caraway, "is the kind of man somebody sent to me to assume the responsibility for what was done."

Mr. Felder explained at the time that he had been employed to determine whether Mr. Morse was entitled to receive executive clemency. He said he had received a retaining fee of $5,000, and an additional $1,000 for expenses, but he alleged that he did not know whether this money had been put up by Mr. Morse or not.

The Insolence of Felder

MR. FELDER recently took exception to a newspaper story, in which it was stated that Commissioner Tod demanded the deportation of a group of aliens who had entered the country as a result of political influence, and that he had picked three cases to force a showdown. Mr. Felder thereupon wrote the following communication to Commissioner Tod:

"The cases 'picked' by you in order are Ruth Trompeter, the Sas family and 'Sammy' Goldman. I happen to represent Ruth Trompeter and I am familiar with all the facts relating to her case. I have no knowledge of the facts in the other two cases. The charge that political influence was used in connection with the case of Ruth Trompeter is absurdly false and I assume that you made it without full knowledge of the facts.

"There was never at any time and under any circumstances the slightest disposition of the relatives of the girl to avoid the final judgment of the Labor Board in respect to her case.

"I consider your charge that political influence was brought to bear in behalf of this girl a reflection upon my professional integrity. In this view of the case I cannot allow the charge to go unchallenged, because, as I have above stated, it is without the slightest foundation in fact.

"I have represented from time to time several aliens. Their inability to pay fees did not deter me from rendering services necessary. Where they or their relatives were able to pay fees, I accepted substantial compensation, which I turned over to some charity controlled by the particular race to which the alien belonged. I not only did not retain any part of the money for my compensation, but did not even make any deduction for the amount to cover my expenses on the numerous trips that I made to Washington. In other words, all services rendered by me were rendered without reward or hope thereof.

"When this poor little girl was brought into the country with her family, she was ordered by the local authorities at Ellis Island deported upon the ground that she had a loathsome disease, that is, favus, and that she was feeble-minded. The matter was taken to Washington, and she was ordered admitted under bond, upon the condition that her relatives would send her to a private school, where she could be treated for her ailments. At the expiration of the time limit, she was again ordered deported. Realizing that this child had improved mentally and failing to discover any evidence of the so-called loathsome disease, I caused her relatives to have her examined by physicians and surgeons in the City of New York, who reported that if she had ever had favus, she was entirely cured.

"Dr. Graeme Hammond, one of the most distinguished alienists in America and author of several books on the subject, who had the girl under observation for months, prepared an affidavit, the original of

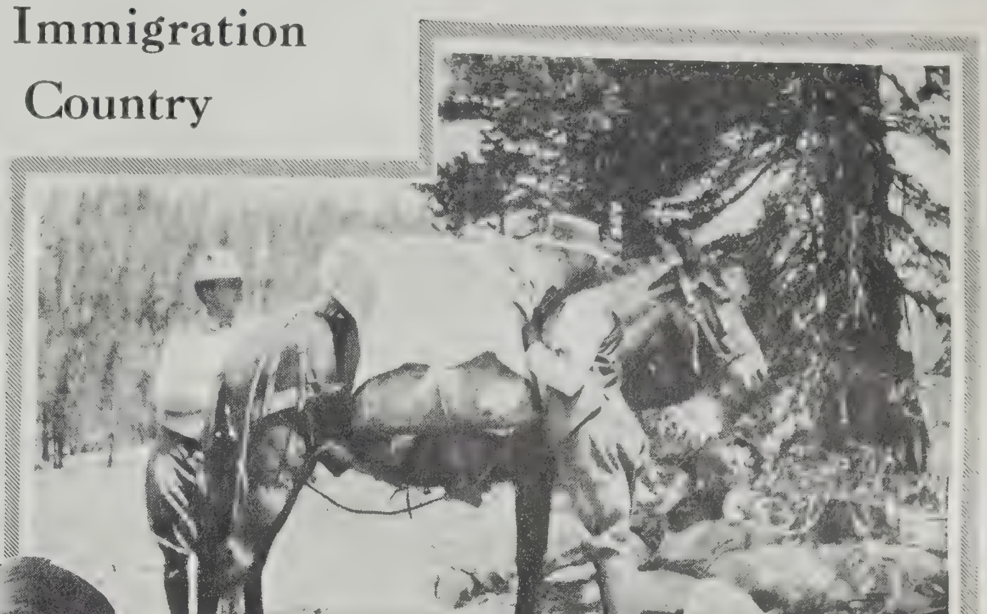
(*Concluded on page 14*)

Note—Since this, the second of two articles by Mr. Collman, was written, Mr. Tod has resigned as Commissioner. The clipping from the New York *World* reproduced on this page tells the story.

Emerson Hough, Prophet of the Frontier

He Felt Keenly That Bad Immigration Already Had Ruined His Country

By LEWIS WORTHINGTON SMITH



Mr. Hough (the figure at the right) is shown here in the western wilderness he loved so well.

EMERSON HOUGH was in the first place a man with a keen zest for life. More particularly that zest found its inspiration, its delight, its thrill of satisfaction, in the ongoing of American civilization across the rivers, the prairies, and the mountains of the West. He loved intensely the out-of-doors and the life of action. His travels took him all over the continent, hunting, fishing, gathering relics of the wild life that was passing and of the border struggle that in his younger manhood was yet a something to be seen and known. These aspects of life enthralled his imagination. At two of the deeper passions of his nature they caught and clung. The romance of empire-building from the Mississippi to the Golden Gate was a fascination for him. The picturesque freshness of the open country not yet subdued to regularity and primness captured his fancy and ran with the rover impulses of his blood.

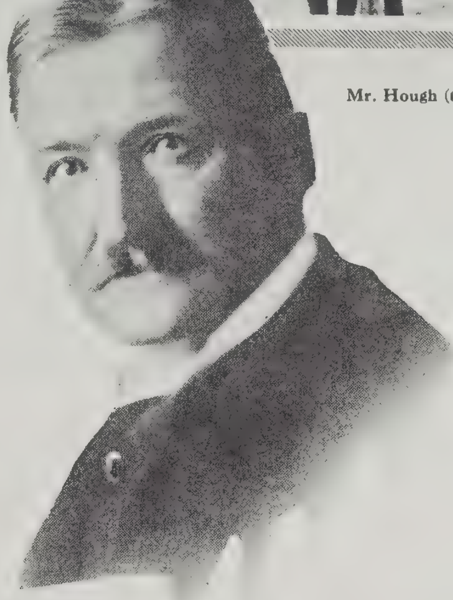
When so much has been said, however, there must at once be recognition in him of another quality having a compensating grace. Much as he rejoiced in the open and in the wild, he held no brief for the philosophy of the cave man. His code of morals and of manners alike was the gentleman's code. Moreover, it was always the American's code. If in the South Sea Islands or in other parts of the earth where the primitive still survives there is also a gentleman's code in its kind, it was not a code for Emerson Hough. In a personal letter in my hands, written not long before he died, he made the emphatic and regretful statement that bad immigration had already ruined America. "Roosevelt!" he added, "how we need him!" His love for the woods and the hills and the streams was a love for the wholesome and the refreshing. It was untainted by any desire to mix with the raw, the vulgar, or the savage. To him the spirit of America was the spirit of manliness in action, the spirit out of which clean souls leap to the doing of something that shall be a joy with no bitter after-taste.

As the author of more than a score of novels, he came to his crowning success in the last one to have a place among his books before his death, "The Covered Wagon." The story has its hero, its heroine, and its villain, but its great figure is none of these. Indeed, it is no one person, but the hardihood of America itself breaking its way across the continent and braving innumerable dangers that it may turn the waste places of a new world into the happiness of homes.

More than possibly it is one of the marks of the greatness of Emerson Hough's achievement in tracking the course of the pioneer across the prairie that he does not make him a demigod or ask us to dream of him in the likeness of Hector or Agamemnon or Achilles. As Hough shows him to us he was but a man beating out his own destiny. Perhaps as in Blashfield's painting in the capitol at Des Moines, Iowa, Hough's native state, visions attended him, and his coming was something like the coming of Aurora. This conception of the man who drove the oxen before the covered wagon must have in it some measure of truth, but Hough's picture does not over-exalt him. He was simply an eager man and a brave man. He had hopes and he had strong hands to bring them to fulfilment. He wore no shining armor. He challenged no one to single combat. He asked no gallery of ladies to crown him with the glory of their applause.

When I came to Kit Carson in "The Covered Wagon," I think I was a little disappointed. I could remember reading over and over again, out of a big book whose green cloth cover comes back to me still from my boyhood, the exploits of the great frontiersman who served as guide to Fremont. He was a quiet man in life, modest and unassuming, but in "The Covered Wagon," he seemed to me, as I read, to pass with too little notice. It cut across one of the enthusiasms of the days when I longed to go out against the Indians that the hero of those boyish imaginings should be so mildly heroic on Hough's printed page.

In the way of critical report rather than in the way of emotional reaction, however, it is to the author's credit that he has not overstrained his characters or tortured truth into a glamour of unreality. For this gift of restraining certitude, a further gift of humor is in no small measure responsible. There are smiles in plenty lighting up the pages of his books. Perhaps they are sometimes a little hard and ironic. Perhaps he sees the foibles of human nature in the characters that he creates more clearly than is the way of many novelists. If so, he looks at them with an eye of understanding sympathy and tenderness. In the judgment of the thinker, studying his world and measuring its good and its bad, there is a place for the humanity of the man.



EMERSON
HOUGH

Emerson Hough's work first came under my eye when I was little more than beginning to be conscious of the names of writers and he had just been graduated from the University of Iowa. His stories ran in the literary weekly that probably succeeded in keeping itself alive longer than any other in the city by the lake, *The Current*. In those days Hough wrote poetry as well as prose, and when he died the other day, out of the yellowing pages of an old scrapbook one of his poems, "By the River," cried out to me hauntingly. After the harvest of the years and its ingathering I read it with a new interest, wondering whether it had in it any hint of prophecy. These are the lines that seemed to me to be the maturity of the man showing itself in the flush of his early eager endeavor.

"To each mortal who hath strivings,
To each mortal who hath hope,
To each mortal who hath longings,
To each mortal who hath dreams:
Strive, oh man, and I will aid thee;
  Hope, O man, for hope is meet;
Dream, O man, and I will aid thee,
  For to me man's dreams are sweet."

One of the dreams that Hough himself cherished was that of the preservation of the natural beauties of the mountain regions of the West. This desire of his heart he lived to see substantially realized. Vandalism he hated with a hatred fitting for a fine spirit. Some years ago in an article in the *Saturday Evening Post* he poured out something very like contempt upon those who leave behind them, riding away comfortably in their automobiles, perhaps, the unsightly debris that the wanton human animal, camping by the roadside or where he pleases, scatters in his wake. In the winter of 1895, traveling on ski, he explored the Yellowstone Park. It was out of this trip that there came the legislation by which Congress has protected the park buffalo.

Born in Newton, Iowa, June 28, 1857, his first pronounced success came with the publication of "The Mississippi Bubble" when he was forty-five. In this the historical interest was of course pronounced, and it found place in story after story that followed. In "The Way of a Man" he tracks John Cowles from that Virginia that was his own ancestral family home out into the West on the trail of Colonel Meriwether. In this there was also the journeying of the covered wagon, and the movement of actual events that had being in a real time and place is in the air. Mr. Hough's art is too firm and sure, however, for him to make his story out of these things. He knew that for a novel he must have not the stirrings of a nation, but a man and a woman with other men and women working out their destinies together through struggle and pain.

In another of his successes, such a success as "The Way of a Man" cannot be called, "Fifty-Four Forty or Fight," he has the historical background of a great popular and diplomatic struggle. It is a story of intrigue, and the central figure is a woman about whom center the personal passions of love no less than the mass passions of patriotism. To what in this is really the author's romantic invention he has given an air of verisimilitude that must be accounted as going beyond the historical fact. Nevertheless it is a wonderfully dramatic rendering of a great episode in the winning of the West for the flag of the stars of the states in their azure field.

Although Emerson Hough came of good Virginia stock, he had to make his own way to a place in the world. It was only within a year of his death that he could see that the road had become easy and could feel that his hands were not too empty. Even then he was the victim of one of life's little ironies. With more demand for his work than he had strength to meet, he broke under the strain. He should yet have had years of achievement before him. As it is, he leaves behind a body of fiction in which the constructive spirit of our American civilization becomes a marching romance of achievement. It is not history, but it has history as the thread on which it is strung. In it the historian may find, if not the literal fact, the thing out of which facts come into being, the eagerness of aspiration, and looking at the hills on the horizon, and the rush of feet taking the road on and on.

A Comrade Rides Ahead—To the Memory of Emerson Hough

By DOUGLAS MALLOCH—Courtesy *The Saturday Evening Post*

Time brings not death, it brings but changes;
  I know he rides, but rides afar,
Today some other planet ranges
  And camps tonight upon a star
  Where all his other comrades are.

For there were those who rode before him,
  As there are these he leaves behind;
Although from us time's changes bore him,
  Out there our comrade still will find
  The kinship of the comrade mind.

Time brings us change and leaves us fretting;
  We weep when ev'ry comrade goes—
Perhaps too much, perhaps forgetting
  That over yonder there are those
  To whom he comes and whom he knows.

I would not hold our loss too lightly;
  God knows, and he, how deep the pain;
But, friends, I see still shining brightly
  The brightest link in all our chain
  That links us with a new domain.

  Time breaks no circle such as this.
For this I swear, because believing:
However hurt, however grieving,
  However much a friend we miss,
  Between the worlds is no abyss.

For friendship binds the worlds together—
  World over there, world over here.
From earth to heaven is the tether
  That brings the earth and heaven near
  And makes them both a bit more dear.

Not weaker now our chain, but stronger;
  In all our loss and all our ill
We now shall look a little longer
  At ev'ry star above the hill
  And think of him, and have him still.

Whatever vales we yet may wander,
  What sorrow come, what tempest blow,
We have a friend, a friend out yonder,
  To greet us when we have to go—
  Out yonder someone that we know.

To all eternity he binds us;
  He links the planet and the star;
He rides ahead, the trail he finds us,
  And where he is and where we are
  Will never seem again so far.

Intricacies of Law Aid Hard Coal Barons

Government Long Held at Bay in Its Attempts to Smash Holding Corporation Formed to Handle Pennsylvania Lands

By WILLIAM A. M'GARRY

WHEN George J. Gould died abroad a few weeks ago, after a lingering illness, the newspapers were filled with obituaries of the dead man that told far more about his father, the famous—or notorious—Jay Gould, juggler and wrecker of railroads, than about him. Columns were devoted in some newspapers to accounts of the elder Gould's exploits in Wall Street. It was freely admitted that the baneful effect of his stock-watering operations is still felt, thirty years after the waning of his power. But the whole effort of most of these accounts was to show that the days when one man or a group of men could wield such power have gone, never to return; that modern financiers are too "intelligent" to attempt to juggle railroads as Gould did, and that the interests of the public, the shippers and the stockholders are recognized today as equal. The Gould point of view, said these historians, is dead.

Let us see. In Philadelphia the Federal Court for the Eastern District of Pennsylvania is wrestling today with a case that has been on its dockets, or that of some other United States court, since 1902. It is a case peculiarly of interest in connection with reference to the Goulds, since it had its inception in what was perhaps the greatest failure of the elder Gould. In 1896, Henry Clay Frick and others balked the efforts of Jay Gould to get control of the Philadelphia and Reading Railway Company. The late George F. Baer, who will live forever in American industrial history as the man who promulgated the theory that rich men are the trustees of natural resources by "Divine Right"—which is nothing more nor less than the doctrine of kings—helped to frustrate Gould. He created the Reading company, a "paper" corporation to control the railway, the Philadelphia and Reading Coal and Iron Company, and their subsidiaries. This was called a reorganization. It froze out Gould, intrenching other interests.

Latest Stage of Fight

THE case today is the latest stage of the government's effort to smash the hard coal trust. Its present phase has been before this particular court since 1920, when the Supreme Court of the United States ordered the Reading company to dispose of its control over the Coal and Iron Company, and also ordered its chief subsidiary railroad—the Central, of New Jersey—to sell the coal mines held in its name. These mines were held under the corporate name of the Lehigh and Wilkes-Barre Coal Company, which is admitted to be the largest profit-maker among any of the big anthracite producers. As a natural consequence of what has happened in carrying out the order of the Supreme Court, the case has divided itself into two parts. The first action—of which the other is a consequence—may be termed for the sake of convenience the Reading dissolution proceeding. The second relates wholly to the sale of the Lehigh and Wilkes-Barre Coal Company.

It will be shown in these articles, from sworn testimony, from the statements of such distinguished counsel as United States Senator George Wharton Pepper—who has never been accused of radical tendencies—and even from statements of the highest jurists in the nation, that the Gould point of view is not dead. It will be shown that Gould's pet practice of a "paper sale," or the "sale" of something to himself to strengthen his grip on a property or to inflate its apparent value, is still a matter of ordinary business in the hard coal railroad industry, even when the terms of the sale are in direct opposition to the specific orders of the court. To make clear the situation governing that sale, however, it is necessary to give some outline of the Reading dissolution proceeding, and the events that led up to it.

Reading Formed in 1896

AS STATED, the Reading company was formed by Baer and his associates in 1896, and by the beginning of this century its deadlock was so strong that nobody could do business in any phase of anthracite without paying tribute to the combination. The railroads, led by the Reading, set themselves up as absolute dictators. Independent coal mine owners were allowed to operate only under the infamous sixty-five per cent contracts, which provided that all coal mined be sold to the railroads for sixty-five per cent of the prevailing market price. The Temple Iron Company was set up as the clearing house for the big railroad operators, and in 1902 the government launched its first anti-trust suit against the hard coal combination. That action resulted in the smashing of the Temple Company, but this was foreseen by Baer and his associates. Accordingly, power was gradually withdrawn from the Temple and shifted to the Reading.

It is not necessary to go into the various suits that followed, the sum total of which was nothing in so far as any dissolution of the Reading was concerned. There were many of these actions. But in 1907 some progress was made, and again in 1912, when a general order was issued by the government for the divorce of railroads from coal mine properties. After many failures, a decision was handed down in 1915 by the District Court holding that in both organization and management the Reading company group was in violation of the anti-trust laws, in that it maintained a monopoly in anthracite. The court then ordered the dissolution of the entire organization built up by Baer. But the lawyers were not yet finished.

The case was carried to the United States Supreme Court, where it dragged along in one form or another until 1920. In that year the court handed down a decision which was hailed by the Wall Street workers and the anthracite experts as a victory for the railroad, although in part it upheld the decision of the lower court. It ordered the sales as outlined above. But it made one highly important change. It ruled that although the Reading company was in violation of the anti-trust acts in its organization, it was not guilty of such violation in its management. That, of course, made it impossible to fasten personal responsibility on anybody. The whole career of coercion in the coal regions, and kiting the price of coal to the consumer, was blamed on the original organization, founders of which were now long dead.

It is interesting, in view of the opinion so generally expressed in the newspapers that stock watering has ceased, to note that the Supreme Court was not by any means a unit on this decision. The late Chief Justice White led a minority of three which voted to uphold the decision of the lower court as it was written. In writing the minority opinion these three justices said: "The great power of the combine was used in plain violation of the anti-trust laws. It is difficult to imagine a clearer case of violation." Attorneys for the United States Government used even stronger terms, and they had evidence to prove many of their charges of high-handed disregard of the law. But the decision of the Supreme Court stood, and under it the case went back to the district court for decision as to the method of dissolution. Later a similar decision was rendered against the Lehigh Valley, and some optimists held that the government was at last on the verge of smashing the coal trust.

Consumers of coal, however, do not need to be reminded that throughout the period preceding this time, when several dissolution orders had been handed down, and since then, the price of coal has moved in only one direction, and that is upward. The man in the street may wonder what the government hoped to accomplish. Briefly, the theory was that by smashing the combine, a free market for anthracite might be established. It has been shown by experts that a free market, with free shipments, would mean inevitably a larger production. The operators themselves say that price is regulated by the law of supply and demand. By controlling the production, the railroads regulated this economic law. Various methods were used, the most obvious one being that of car supply. A mine operator can ship only as much coal as the car capacity assigned to him by the railroad over which his coal must move.

The Stockholders' Rights

AT THE time of the Supreme Court hearing it was stated by Federal attorneys that the Reading company, established by Baer and others to be the holding concern for the railway and the coal and iron companies, took over those concerns "at no outlay." But now that dissolution has been ordered, the holders of Reading stock, of course, have legal rights. There are so many conflicting rights that it has not been a difficult task at all to bring about delays. When the matter came back to the district court, a date in January of 1921 was fixed as the time limit for the submission of a plan of dissolution. Provision was made, however, for delay. The dissolution is yet to be accomplished. Various succeeding plans have been put forth, and one is now before the court for decision. Roughly, it will mean a merger of the Reading company with the Philadelphia and Reading Railway Company, and the sale of the coal and iron company.

It is not the intention here to attempt an analysis of the stock-holding jumble created by Baer and his associates, which the government is now attempting to unravel. But an outline of what the Reading owns is significant, bearing in mind the assertion that it took over these properties "without outlay." It owns $42,481,700 of the stock of the Philadelphia and Reading Coal and Iron Company, which is about ninety-two per cent of the total outstanding. It owns $14,504,000 worth of stock in the Central Railroad Company of New Jersey, out of a total outstanding of $27,430,000—more than enough to control that railroad. It owns all the stock of the Philadelphia and Reading Railway Company. But that isn't all. The Central of New Jersey owns $8,489,400 of the $9,210,000 stock issue of the Lehigh and Wilkes-Barre Coal Company. And the Reading company holds title to the equipment used by the Reading railway, carried in the books at more than $43,000,00, plus floating equipment of more than $4,000,000, plus equipment pledged under trust certificates worth more than $20,000,000 more. There are some eight million dollars in dividends from the coal company that will go to the stockholders of the Reading company under the dissolution plan.

The Reading company—the holding corporation with all the wealth outlined above—is capitalized at $140,000,000. Of that amount the Baltimore and Ohio Railroad Company and the New York Central Railroad Company own, jointly, $68,565,000. The president of the Baltimore and Ohio Railroad is Daniel Willard. Edward T. Stotesbury is chairman of the board of the Reading company. It is important to bear their names and their titles in mind, since they, with Robert W. de Forrest, were named by the board of directors of the New Jersey Central to supervise the sale of valuable Lehigh and Wilkes-Barre coal property. All of the three men were naturally directors of the Central at the time. They were also directors of numerous other corporations that brought them together from time to time.

In the final order for the Reading dissolution, entered by the district court in the latter part of 1920, the following instructions were given by the court with regard to the sale of the Lehigh and Wilkes-Barre: "The Central Railroad of New Jersey shall dispose of all the capital stock of the Lehigh and Wilkes-Barre Coal Company now owned by it, to persons or corporations who are not its own stockholders or stockholders in either the Reading company, the Philadelphia and Reading Railway Company or the Coal Company." The court further enjoined that any purchaser or purchasers of the coal company should take oath before and at the time of purchase that they possessed this essential qualification—that of not being interested in any of the corporations named. This fact also is important, in view of what happened later. On January 5, 1921, the time limit set by the court for the presentation of a dissolution plan, there wasn't any. It was quite evident that the policy decided on was one of delay.

Insiders Are Astounded

FOR that reason even the insiders in anthracite were astounded when they learned that the Central really intended to sell the Lehigh and Wilkes-Barre. They were particularly astonished by the fact that plans evidently had been made to shove the sale through in a hurry. Bids were asked for, but according to many potential bidders, information was withheld. Nevertheless an offer of $150 a share was made by the Jackson E. Reynolds syndicate for the 169,788 shares of Lehigh and Wilkes-Barre held by the Central Railroad of New Jersey. It has been stated that the coal company is one of the largest profit-makers in the industry. The bid was so low that Messrs. Stotesbury, Willard and de Forrest rejected it, and called for more bids. In November, 1921, the coal company was knocked down to the Jackson E. Reynolds syndicate for $31,410,780. The price a share was $185, and the total increase of this bid over that first made was $5,942,580. But even at that price some of the stockholders of the Jersey Central raised a hue and cry and asserted that they had been cheated. Accordingly, suit was brought to have the sale declared illegal. It was brought in the name of minority stockholders of the Central, but at one time the government also intervened to ask that the sale be set aside. The court has not yet acted.

With this background of information it is possible to get some sort of comparison between the sale of the coal company, through Messrs. Stotesbury, Willard and de Forrest, all railroad millionaires, and the operations of the late Jay Gould. A beginning may be made with Jackson E. Reynolds. He started life as a law clerk and is now president of the First National Bank of New York. He was a member of many directorates interlocking with that of the Jersey Central, from which he had recently resigned. As will be shown later, he went around among men engaged in the coal industry and got subscriptions to his syndicate with which to raise the purchase price. Under the terms of the syndicate he was given absolute control. He had and still has a power of attorney to dispose of it as he may see fit, but, of course, he cannot act while the sale is under attack in the courts. If the sale to his syndicate is approved, he can accept the bids of other syndicates and resell the control of the Lehigh and Wilkes-Barre at a profit of approximately two million dollars. But it is not at all certain that a direct, resale profit is what the millionaires' association was after in rushing through the sale.

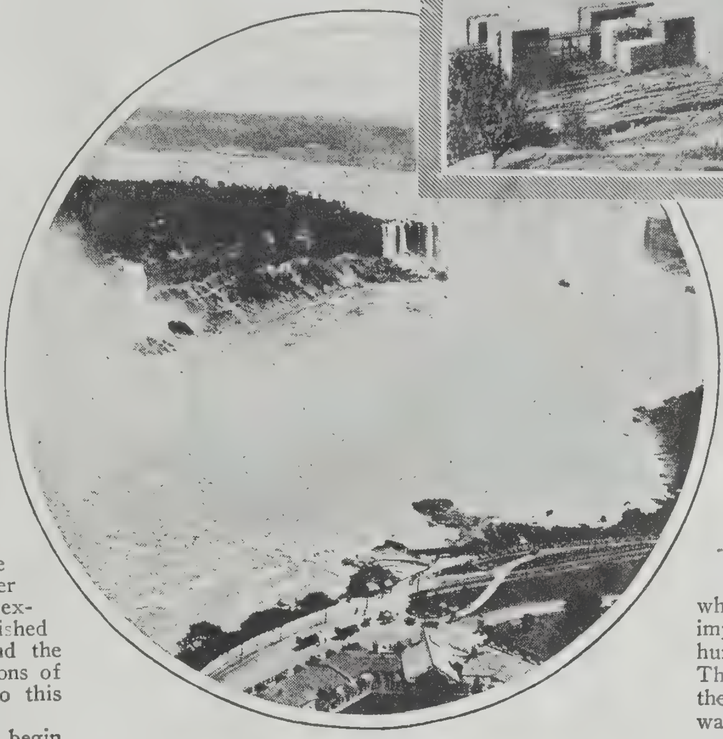
Freight Rate Helps, Too

DIVIDENDS declared by coal-hauling railroads in recent years prove that all the profit in anthracite does not come from the sale of that commodity. A great deal of it comes from the freight rate. At $2.50 a ton, the Central Railroad of New Jersey got ten million dollars a year from the Lehigh and Wilkes-Barre Coal Company, or rather from the ultimate consumers. Mr. Reynolds was closely associated with the men who supervised the sale. Many of the stockholders were also so associated. In spite of the order of the court, it was asserted and not denied that C. F. Huber, president of the Lehigh and Wilkes-Barre, had taken a nine-million-dollar interest in the syndicate to which was transferred control—although not all of that shows in the record. Therefore, when the minority stockholders brought their suit they were not dependent merely on the testimony of other bidders, who insist that they offered two million dollars more for the coal stock than the Reynolds syndicate paid, and that information was withheld from them. The petitioners put forth the suggestion that a secret agreement existed between the selling committee and the Reynolds syndicate under which the coal would continue to move over Reading and Jersey Central lines. That, in effect, would destroy the whole effect of the dissolution, if the same plan could be made to govern the sale of the Philadelphia and Reading Coal and Iron Company.

Further details of this sale, with a description of mysterious "investors" who sprang up overnight from penury to wealth, will be given in a succeeding article.

Twelve Hundred Miles on the Great Lakes

Region That Abounds With the Memories of Bitter Days of Strife Now Unguarded Along the Border



Above—Parry Sound, Ontario.
Left—It is not only as a scenic wonder that the Falls have their interest. It is a tremendous asset as an electric power-producing force to the manufacturing establishments, commercial buildings and private dwellings within an area of several hundred square miles.

By JOHN T. FARIS, D. D.

This is the first of four articles by Dr. Faris. The others will appear in early issues.

THE most striking section of what has been called the world's most remarkable boundary line—that between Canada and the United States—passes through four of the five Great Lakes, threads the Niagara River, bisects Niagara Falls, and finds its way between the friendly banks of the Detroit, the St. Clair and the St. Mary's rivers.

The traveler who traces this line recalls with wonder that he is passing where history was made by Indians, by explorers, by traders, by warriors. But it will evoke still more wonder to realize that he is tracing an unguarded boundary—not once in thousands of miles is there evidence of the jealous dread that causes armaments and preparations for defense. The fortresses are only relics; the records of warfare tell of days so far away that they are lost in the mists of the past. For, to quote a writer on international relations, "In 1817, by a simple exchange of diplomatic notes, war vessels were banished from Lake Champlain and the Great Lakes, and the agreement, adjusted to meet the changing conditions of ship construction and revenue patrol, endures to this day."

Memories of the times of suspicion and strife begin at once after Ontario's waters are entered, for Kingston, the first capital of Upper Canada, still has the empty shells of defenses that succeeded the Fort Cataraqui and Fort Frontenac of long ago.

But the memories of the staid city by Cataraqui River go back even of the earliest French fort, to the day in 1632 when Champlain passed that way, named the broad waters Lake St. Louis, and noted on his map of the region that on the spot where the West Point of Canada was built, more than two centuries later, there were large numbers of "stags," as he called the wapiti—an animal found today only in a few scattered districts of Canada's great West.

Those who ride at ease in the palatial steamers that ply between Kingston and Toronto find it difficult to imagine the days of La Salle, who in 1879 built the first sailing vessel on Lake Ontario. His shipyard was at the Cabins, as Kingston was then called.

Fortunately, the present-day successor of La Salle's little sloop keeps close to the north shore of the lake, instead of launching out to the region of the mid-lake boundary line. Thus it follows the tortuous channel between the mainland and the irregular peninsula of Prince Edward County, through the beautiful Bay of Quinte, to Trenton, at the mouth of the Trent, the stream which is the outlet of Trenton Waterway through a bewildering succession of rivers, creeks and lakes, to Lake Simcoe, and on to Midland on Georgian Bay. Think of two hundred miles of the best canoeing waters, in the midst of the richest section of Ontario, past Peterborough, the father town of the most famous of all canoes; through the curious hydraulic lift lock, where the canoe enters one of two twin steel locks, and is lifted more than sixty feet when the second lock is filled with water; on to Lake Katchewanooka and the rest of the Kawartha Lakes, and finally from Lake Simcoe to Lake Couchiching, the "Lake of Many Winds," and through the Severn to Georgian Bay! Once the Ojibway Indians took delight in passing along these waters, and today braves of the old tribe are glad to serve as guides to those who would go with them through the country that still whispers tales of the days when the Iroquois fought the Hurons, and when the Mississaugas took their turn at conquest.

Those who take the short cut offered by the Trenton Waterway should also make the roundabout journey which leads past Toronto and into the Niagara River, between Fort Niagara in the United States and Fort Mississauga on the Canadian side, up through the gorge which marks the recessions of the Falls through countless centuries, then by car along the bank, past the Whirlpool and the three bridges thrust daringly across the swift waters, until the overwhelming spectacle of the Falls appears, as it appeared to Hennepin in 1678. Three years later he published the story of his impressions, and ever since visitors have tried to tell of the indescribable tumult of the plunging waters, the majesty of their descent over the brink, the graceful curves along the three-quarters of a mile of the crest, broken by the green of Goat Island, the impressive straight front of the American Fall and the ever-deepening apex of the Horseshoe Fall.

Queen Victoria Park, set apart on the Canadian side that visitors may enjoy the Falls without hindrance, vies with the New York State Reservation on the opposite shore in giving opportunities for studying the vast spectacle in all its moods. But many will feel like agreeing with the observer of the Canadian Geological Survey when he says that in many respects the grandest and certainly the most comprehensive view of the Falls and of the river, both above and below the Falls, is obtained from the point called Falls View on the Canadian side, not far from the memorial on the battlefield of Lundy's Lane, one of the numerous memorials that tell of historic events within sound of Niagara.

After listening long to the resounding boom of the Falls, the quiet of the renewed boat trip—now along the waters of Lake Erie—is a welcome change, though the opportunity for rest is short unless the temptation to take excursions up some of the streams entering the lake is resisted.

One such temptation comes beyond Point Maitland, where the Grand River joins the lake after leaping over impeding rocks and falling six hundred feet within two hundred miles, and one thousand feet from its source. This meandering stream was a well-known haunt of the Indians, who sought its banks for their hunting, its waters for their fishing, and the long reaches for their canoeing.

A particularly popular portion of the river was in the vicinity of Brantford, the city named for Brant, chief of the Mohawks, and long famous as the headquarters town of the Iroquois.

Above Brantford and Galt the haunts of the Indians are everywhere, especially in the neighborhood of Elora, where the Grand River flows through a canyon whose sheer walls of dolomite rise more than eighty feet. From a tributary gorge comes the Irvine River, after a journey between walls as deep as those of the Grand River Canyon, and surroundings as beautiful. Just above the junction are the Elora Falls of the Grand, a site set apart by Indian legend, as are the numerous glens farther up stream, once secure hiding places of the hunted savages.

Perhaps thirty miles from the mouth of the Grand River, the little Lynn River enters the lake. The stream is remarkable chiefly because of the connection with the expedition of François Dollier de Casson and René de Brehant de Galineé, who, on March 23, 1670, erected a cross on the shores of Lake Erie, with the arms of Louis XIV at the foot. Thus they took possession of the region for France. The inscription placed on the cross told how they, with seven other Frenchmen, had been the first Europeans to winter on the lake. Near by are traces of the foundation outlines of the buildings in which the winter was passed. And on a promontory high above the water a modern cross, erected in July, 1922, by the Canadian National Parks, calls the attention of the pilgrim of today to the cross of other days.

Another reservation of the people is one hundred miles or so farther on, beyond Rondeau Harbor. On the little peninsula, Pointe aux Pins, a wonderful bit of primeval forest has been set apart in the Rondeau Provincial Park. Of the eight square miles in the park, perhaps half are covered by the forest. There game animals, including many deer and beaver, are protected from the hunter, and prove a constant lure to the student of wild life.

Not far away, on a triangular bit of land, extending nine miles out into the lake—the southernmost portion of Canada—is Point Pelee National Park, dedicated to the preservation of wild life, and especially the migratory birds. There, in spring and autumn, the birds pause on their journeys to and from the Northland. Wild fowl breed in the marshes, and trees make beautiful the west side of the point, which looks toward Point Pelee Island, and its companions scattered about in Lake Erie, toward the shore of Ohio. Most famous of these islands is Put-

A Young Noblewoman Escapes the Bolsheviki

Eyewitness of Hungary's Bloody Interval Describes Her Experience

By MARGITA DE REGECZY

The writer of these articles on Bolshevism is a Hungarian noblewoman who passed through the Bela Kun Revolution in her country. Being young and resourceful her fate has been more fortunate than many of her class, for she has availed herself of a very unusual skill in speaking and writing and music to maintain her place in the world. Although but a short time in this country she has made numerous friends in both public and private engagements, who will be glad to have a printed record of the events she has detailed to them.

EVERYBODY, I imagine, has read about Bolshevism and yet the American public knows very little about the real conditions in those poor, lawless Bolsheviki-stricken countries. I have myself several times heard it said, that Bolshevism was "not so bad," and this from people who have never experienced any of its consequences themselves. They gathered their views from dry newspaper accounts, which do not convey the situation to the imagination. In the following I will relate a true Bolsheviki story, which is at the same time the story of my coming to the greatest country in the world, to the United States.

* * *

Budapest, the capital of Hungary, was a very gay and luxurious city until some time ago. Even during the war one entertainment followed the other. The war lasted so long that one had grown used to it. Most rich people not touched personally by the war resumed their habitual way of living and there was a large set of the newly rich trying to outshine the nobility.

Especially in wintertime the city was most fascinating. Long rows of sledges with beautiful horses were flying over the snow. In them you could see happy-looking women, wrapped in rich furs, enjoying the wild drive and the tinkling of many little silver bells on their horses.

When armistice was signed we had been away from Hungary for about half a year. I lost my father—a wealthy Hungarian nobleman—when I was only a small baby. My beautiful, clever and independent mother traveled a great part of each year, taking me and a governess with her all the time. In this way I had seen a great deal ever since my childhood and met many different people. Every year we spent a few months in Hungary, either in our own country house or in Budapest, which was the center of the smart society of the country.

My mother is a refined, intellectual nature, reading and studying all the time. Widowed at 26, she had made up her mind never to marry again, but to live for the education of her daughter and for the study of the beautiful in art and nature. Music was her dominant passion and she had spent a small fortune on my music lessons, going with me to Germany and to England, to study with the most famous masters of Europe. These travels offered me the best opportunity to learn the languages and everything else that my accomplished mother believed absolutely necessary to cram into my head.

Private Property Seized

THE end of the war came and we returned to Budapest after a long stay in Switzerland. The uncertainty of the political situation in Hungary made it necessary to be at home. Everybody hoped that conditions would settle down to normal by and by. But instead of this the terrible social disease, Bolshevism, spread from Russia into Hungary.

One morning a maddened, demoralized crowd was rolling over the streets of the capital. All the men wore red ribbons. The civilians who seemed to be just peaceful citizens, "Bourgeoisie," were seized and insulted, and officers' uniforms were torn off. On all sides pistol shots frightened the population. This was worse than war, this was an uprising organized by an unscrupulous, vicious set of people, with the notorious Bela Kun at their head. This Communistic or Bolshevistic party had bought with Russian money the help of a great number of unemployed and of returning hungry soldiers and had temporarily seized the power. The aim of the revolutionists, who called themselves "Proletarians," was to awaken jealousy and hatred toward the wealthy classes and to get everything into their own hands.

After the first shock my mother calmed herself and said to the servants who pressed around her, bewildered and crying:

"If the crowd should enter the house keep calm and do not show any fear. Fear has never yet saved the situation."

"I think you are right, mother," I told her. "Maeterlinck says that we should always appeal to the highest side of human nature."

My mother had the front door locked fast and the valuables put away in different hiding places. The noise and excitement went on until the evening, but nothing special happened on that first day. Not one-third of the population even dreamed at that time what Bolshevism really meant.

Two days later all private property was seized, the main idea of Bolshevism being that "there is no private property, everything belongs to the state." The state meant, of course, the Bolsheviki themselves.

The middle class was exposed to ruin and starvation from the start. The wealthy people who kept, according to European custom, larger sums of money in their homes were better off and could hope to keep themselves for a while. The first new order issued by the Red government was: "The houses and estates forming private property—the money and jewels deposited in banks—the stores, factories and banks belong from now on to the state."

Desperate-looking crowds gathered before the closed banks, hoping to get some money out. It seemed impossible that everything could be lost in one day.

Nevertheless many faces shone with an ugly triumph; these were the Reds, the Proletarians. During the previous weak government of Count Karolyi, the Bolsheviki-Chief Bela Kun was bribing all those who were willing to join the Bolshevistic movement with big sums from Russian sources. He had convinced a certain class of people that a great social upheaval was necessary that those who possessed nothing might enjoy the privileges of the rich and the rich become poor for a change. In these first days Bela Kun and the other chiefs speedily organized a strong Red Guard for their own protection and safety.

"I wonder if I look like a girl whose family has lost all its fortune two days ago," I thought, watching the careworn features of the citizens. I glanced in the mirror of a shop window, but did not see any change on my face.

As I continued my walk I saw that the churches of all religions were closed and in front of them rough Red Guards explained to crying women that religion was only a superstition, an invention of the "damned Bourgeoisie" to keep the people subservient. I stopped at the gathering before one of the churches and took a crying old woman by the arm to try to comfort her.

"Do not cry. All this won't last long. Bolshevism is a sickness of society."

Immediately a man joined me:

"The young lady is right. It won't end well if they take the churches from the people," he called out aloud.

I noticed that I was the only well-dressed woman in the crowd and attracted attention. Therefore I thought it more prudent to leave the place.

Everything seemed changed in the streets. The Reds were riding at terrific speed on the confiscated motor cars. No private person, no Bourgeois had been allowed to retain a car or horses. All the stores were closed. For the last days one had lived on the food supplies one happened to have at home.

* * *

A few days later my mother entered my room as I was just completing my toilet of a plain dark dress.

"I am trying to make myself look like a Proletarian girl," I said in jest, taking a dust broom in my hands. "If the revolutionists should come in the house I will tell them: what do you want from me? I am only milady's chambermaid."

But mother looked serious and began to read an article in the only paper which it was possible to print, *The Red Flag*. This article announced that in the following days all the rooms of private houses and apartments would be taken and turned over to the victorious "Proletarians," the Red Guards and their families who were entitled to the best places everywhere. The former owner would be allowed to keep three rooms at the very most.

"I have accepted the loss of my fortune without complaint," she sighed, "but I do not know how I shall live if the Proletarians bring insects into my beautiful clean house."

"I really do not think that insects can make one die, mother," I consoled her.

When the Reds Rule

AT THIS very moment the door opened and the maid came in accompanied by four armed Red Guards.

"We came to inspect your house, Citoyenne," one of them began. "You surely heard that you will be permitted to keep but three rooms for your own use. We shall quarter our people in the others."

"Yes, I read about it," mother answered with perfect calmness. "May I choose our rooms or will you choose them for us?"

"You may choose them," the man said—he had evidently not been prepared for so much indifference and civility. "But remember, if you remove a single piece of furniture from our rooms into yours, you will have cause for regret. The government will consider such an act as theft of the state's property."

"Do you really think I care so much for the furniture?" mother remarked. "You can have it. I will not take it with me when I die."

The soldiers walked through the rooms and their leader made a few pencil notes in a book. Entering one of the rooms he asked with a look at me:

"Is this the young Citoyenne's bedroom? All right, we shall give you some nice Red boys for neighbors."

When they left, my mother and I looked at each other. Neither wanted to frighten and break the courage of the other. We heard the Reds laugh loudly in the hall, saying: "These are the first we have met who do not seem to mind losing their d——d furniture."

After a few minutes mother exclaimed suddenly:

"The pearl necklace! How lucky we did not leave it in the bank. We must hide it in our own rooms before the Proletarians come to stay here."

"Mother you read in the paper that the women who hide their jewels will be put in the common prison together with bandits," I warned her. "The Reds will go with experts to search the houses. They searched the home of Countess X., threw dozens of bottles of tomato catsup on the floor, found the pearls in one of them and she was committed to prison."

This story did not affect my mother who was determined to hide her necklace.

"Would you advise me to give the pearls which have belonged to our family for centuries to the Bolsheviki, without even trying to save them?" she asked me.

I thought I better not give any advice and so she pulled the whole keyboard of the grand piano out, put the pearls behind it and pushed it back again.

The next day the Proletarians arrived accompanied by two Red Guards who surveyed how the former were received in their new quarters. One of the men had been a bricklayer in civil life and came with his wife and seven children of all ages, from a wild-looking lad of sixteen down to an infant on the bottle. Three Red soldiers were also quartered in the house.

It might sound funny that the servants resented the arrival of these guests much more than we, and mother took great pains to make them understand how necessary it was to be friendly and polite.

The bricklayer's wife, after making herself at home, contemptuously inspected the kitchen, where the respectable old cook had always reigned supreme.

"What a small kitchen," she grumbled, though the kitchen was beautiful and large and had white porcelain walls. "How on earth shall we all cook here together?"

My mother just entered the kitchen and replied with a fine smile:

"My dear, these are exceptional conditions, otherwise you would not be my guests. We must try to manage somehow and show a little good will."

Undesired and Undesirable

TWO Red soldiers occupied the room next to my pretty bedroom. The day before their arrival the door between the two rooms had been fastened with nails and the heavy velvet curtains, which hung on both sides, loosened, so as to cover the door entirely. But even this did not prevent my hearing their loud voices and the heavy steps of their boots, nor smelling the odor of their pipes.

I went to bed with a small revolver under my pillow. My mother slept in the adjoining room. In the first night I woke up several times with the idea that one of the men was trying the door on the other side. I turned on the night lamp at my bedside and leaned on my elbows, playing with the tiny revolver, which was loaded. But I never had any actual fear.

* * *

A day or two later the cook came to my mother vexed and crying:

"O, Madam, I cannot bear the Proletarians any longer. I have always been used to live with great ladies and now a bricklayer's wife comes to poke her nose into every corner of my kitchen." The good woman dropped on a chair and began to sob desperately.

"Don't be nervous, Elizabeth, and above all don't be such an aristocrat," mother reprimanded her gently. "You might get us all into trouble. We cannot but put up with these people for the present. You have not come to tell me that you would leave me because of the Proletarians?"

"Heaven forbid, I would never leave you under similar conditions," the faithful soul protested. "But if that woman does not keep my kitchen clean, I cannot promise that I will not lay my hands on her."

Time went on and conditions grew worse and worse. The want of food demoralized the greater masses of the population. In the official food stores kept up by the Bolsheviki government the families of Red soldiers were served before the other people, according to an order of Bela Kun. This arrangement forced many a father of hungry children to enlist himself in the Red Guard. Every day dozens of persons committed suicide who had not the strength of mind to bear the awful change in their conditions. By and by all the former politicians and noblemen were dragged to the common prison, where the Bolsheviki kept them as "hostages" for their own safety. They proclaimed that in case of any attempt of a counter-revolution to re-establish the previous conditions, these "hostages" would be immediately killed.

My mother had succeeded with real feminine tact and cleverness "to make friends" with all her own Proletarians. She inquired of Mrs. Bricklayer whether she was satisfied with the beds and presented the baby with some lovely baby clothes. One day she stepped into the hall where the Red soldiers loafed around, smoking their abominable tobacco, and said to them:

"I really think we are safe, my daughter and I, with three such representatives of the Soviet government staying right here in the house."

The men stared a moment speechless, then the one attempted a bow and answered in a somewhat ashamed manner:

"Milady, Citoyenne, you have been kind to us, though we know that all this must be disagreeable to you. Be sure that whatever may happen we shall protect you and your daughter."

A second part of this narrative of Margita de Regeczy's experiences will appear in an early issue.

The United States—Most Homeless Country!

New York Is "Greatest Foreign City," Senator Copeland Points Out

By JAMES MARTIN MILLER

AS PARADOXICAL as it may seem, Dr. Royal S. Copeland, the new United States Senator from New York, is a member and official of St. Andrews Methodist Episcopal Church, New York, and is opposed to sumptuary laws, including prohibition. He has been advertised far and wide as a political "wet," yet he never took a drink of intoxicating liquor in his life and never smoked a cigar or cigaret. He is constantly writing and lecturing against the use of intoxicants and tobacco, and is a strong advocate of temperance in all things. He is as strongly against "padlocking" people to make them good; he believes the principle is wrong. However, he is strongly in favor of enforcing any law we have whether it be "a good law" or not.

We are talking here about a native of Dexter, Michigan, who received his medical education at the University of Michigan. The people of Ann Arbor thought so much of him that they elected him mayor of that university city when he was thirty-two years of age, and after his term expired made him president of the board of education. His father and mother now live in Detroit. When he was nominated for the United States Senate in New York last year, he telegraphed his parents about it. His father responded as follows:

"Congratulations, but where did you get the money? Senatorships in Michigan cost hundreds of thousands."

Dr. Copeland holds advanced degrees from several foreign universities. He came to New York in 1908. In 1918 he became commissioner of public health and president of the board of health. In the race for United States Senatorship last November on the Democratic ticket, with William M. Calder, Republican, Royal S. Copeland won with an overwhelming majority. He is a famous writer on health topics for a large syndicate of leading newspapers.

It is not only as an official member of the Methodist Episcopal Church that he is prominent in religious activities. He is president of the national board of control of the Epworth League and was recently elected a trustee of Syracuse University (Methodist) as well as of Drew Seminary, a Methodist young women's school. There is something of a scramble in a quiet way among the Methodist churches of Washington to get this distinguished Methodist and anti-prohibitionist to make "our church" his church home during his six years' Senatorial term at Washington.

"Old Stock" Is Fading

THE other day as we stood at the window of his busy editorial office in the twenty-second story of a skyscraper in West Fifty-seventh street, I said to Senator Copeland:

"I have visited the American colonies of London, Paris, Rome and Shanghai, but I am now visiting the American colony of the greatest foreign city of all, New York."

"Look out this window," said Senator Copeland, with the vital statistics of the city close at hand. "Here you have a panoramic view of this greatest foreign city, in its make-up, at least, in the world, as you say."

Pointing north toward Upper Fifth Avenue and to the left toward Riverside Drive and Central Park, West, he said: "The sprinkling of Americans who live in these sections have six children per 1,000 Americans, each year. The death rate is 15 per thousand each year. You can figure the net loss as to the American 'old stock.'

"The foreign elements of our population have thirty-five children each year, per one thousand foreign-born parents, and parents of foreign extraction. The death rate among these is twenty per thousand, which still leaves a margin of net gain of fifteen children a year for each thousand of the foreign elements, while in the case of the American 'old stock' there is a net loss of nine each year for every one thousand. There is hardly more than one million of the six million inhabitants of New York City that are of the American 'old stock.'" Thus seriously spoke the distinguished physician, health officer and United States Senator.

The alarming decline in the native birth rate has received but little scientific attention in the United States. It has been, however, the subject of very careful investigation in Europe. It will be of interest to consider the growth of population during the last three centuries of the three leading countries of Western Europe, namely: France, Germany and the United Kingdom of Great Britain. A hundred years ago France was the leader of the three countries, with a population of 29,000,000. The states which composed the Germany Empire had a population of 23,000,000, and the United Kingdom, 18,000,000.

A century later the German Empire headed the list with a population of about 65 000,000, the United Kingdom came second with 45,000 000 and France third with only 38,000,000. The declining national birth rate of France is severely selective in character. The reduction of the birth rate has affected mostly those who are both economically and socially best fitted to bear and to raise a family to maturity. A careful classification by Bertillion of the number of children per one hundred families in Paris shows that the very poor have the largest number and the very rich the smallest number of children. The order of the size of the family is invariably the reverse of the order of the economic condition. This is also true of the United States, and is becoming more so each year. The birth rate in this country is greater as the economic and social status is lower. But that most sacred of all books, the Bible, tells us that "the poor shall replenish the earth."

The difficulty with the situation in the United States is that *we have been satisfied with a gross showing.* The marked increase in our population is, in large measure, the result of two factors, immigration and a high increase in the families of foreign-born parents rather than in the native stock. This is shown by the constantly decreasing proportion which the native whites of native parentage form of the total white population. In 1870 those born of native-born parents formed 67.8 per cent of the total white population in the United States, while in 1900 it had decreased to 56 per cent. The proportion of the foreign stock correspondingly increased during these forty years.

In the New England group of states the proportion of the native white stock decreased from 52.3 per cent of the total white population in 1890 to 40.3 per cent in 1910. In all the areas the native white is playing an ever smaller part in the composition of the total population. In fact, a very definite tendency toward an alarming depopulation has fastened itself upon a large part of the native stock of the country. During the sixty years between 1850 and 1910 there were 976 children under five years of age for every 1,000 women between the ages of 15 and 44 years. During that sixty-year period the number of children under five for each 1,000 women of same ages decreased thirty-two for each of the six decades. And since 1910, statistics show that the decrease is becoming greater each year up to 1922. Authorities on the subject point out that if this decrease should continue for 150 years in the United States, which is a comparatively short time in the history of a nation, there would be no children at all at the end of that time, with the result that the nation would be entirely depopulated.

SENATOR (DR.) ROYAL S. COPELAND

Extinguishing Themselves

MEANTIME "birth control," eugenics and some other fads allied with the feminist movement have captured the imaginations of certain groups of feminists which are made up almost entirely of the American "stock" that is doing the complaining about the foreign elements in this country! These Americans are rapidly extinguishing themselves, as pointed out, while the foreign, or naturalized, Americans, are making good the decreases for which the natives are responsible, and causing a considerable natural increase in our population. How could the situation be otherwise when for the decade ending in 1910 only ten native women out of every hundred had five children or more, while thirty-three out of every hundred foreign-born mothers, and those born here removed one generation from foreign-born parents, had five or more children. The census reports on this subject for the decade betweeen 1910 and 1920 are not, as yet, fully tabulated and available, but an examination of the returns and tabulations thus far indicate that there will be shown a still more appalling increase in the last census period than in the 1900-1910 period.

The disappearance of the home, as we knew it twenty to forty years ago, is keeping pace with this declining birth rate. I mean the home in the sense that the children were kept together and the cooking, baking and washing were all done under the same roof. This was in reality a home. Of the approximately 6,000,000 people living in New York, only one million of them live in homes in this sense. In Washington, D. C., only thirty per cent of the inhabitants live in homes; seventy per cent of them exist in "holes in the wall," called rooms in boarding houses, rooming houses, apartments and hotels. They get their meals at restaurants, lunch counters and boarding houses. In Washington are three big bakeries. The largest one bakes 270,000 loaves of bread each day. They supply bread for Washington and ship it to near-by towns. This same condition exists in New York, in Boston, in Chicago, in Detroit, Kansas City, in Denver and other cities. It also exists to a lesser degree in the smaller cities and towns throughout the country, particularly in the Northern States. The Southern States have not been stripped of the homes as have those of the North. There is also more religious fervor and spirituality among the people of the South, and the churches are far better attended in those states. All reports on the subject indicate this. The one who has traveled extensively in the South, and sojourned there, is strongly impressed with truth of this. The cooking, baking and laundry work is done in the homes of the South far more than in the North.

A traveling salesman of twenty-five years' experience in selling flour for one of the great flour mills of the Northwest said to me: "You used to see scores of bags and barrels of flour in the little corner grocery. Often the smallest grocer would buy a carload of flour from me. He sold it to the homes. Now the little grocer buys very little or no flour. The big bakeries that now bake nearly all the bread, cakes and pies, buy a train-load of flour very often. This means that the baking is no longer done in the homes as our mothers did."

Every village has laundry agencies that feed the big laundries of the cities. The laundry business in the United States has grown to enormous proportions. A quarter of a century and more ago women and girls made their own clothes largely. Now our Jewish-Americans get rich by manufacturing and selling women's ready-to-wear clothes. This business alone amounts to one billion dollars a year in this country.

A young woman, the wife of a teller in a bank, recently said to me: "I don't keep house because I can't get a servant." I asked her: "Did your mother or your grandmother have servants?" "No, they didn't," she replied, "but that was a different age." *And she was right; it was a very different age.* The people of those days were "old-fashioned"; we have "new-fashioned" the home and the family out of existence, or at least snuffed it out, up to the danger point. "Oh," some one says, "our schools now teach domestic science and sewing to the girls." True, but what do they do with these accomplishments when they acquire them?

Housewives Are Going

WE HEAR a great deal of loose talk about there being "too many people in this country now." For continental United States we have about thirty-five inhabitants to the square mile. France has nearly six times the density of population that we have, or about 200 to the square mile; Germany has 300 to the square mile, or nearly nine times the density of population that we have; Belgium has 700 to the square mile, or about twenty times the density of population that the United States has. There are twenty people on each square mile in Belgium to our one inhabitant per square mile. There is less waste land in this country than in some of the European countries. What is meant by waste land is land that is not fertile or fit for cultivation.

We might as well face the truth and own up that the United States, with all our wealth and our boasted "high standard of living," is the most homeless country in the world. No such condition exists in any other country in the world, even with the deplorable conditions existing in the war-stricken countries. Nearly all the people in most other countries have homes, "be they ever so humble."

Treasury Department tax receipts just received show that the people of the United States consumed 53,565,029,520 cigarets for the year 1922. The exports just about offset the imports. This is about twice as many cigarets as all the rest of the world consumed. We have one-sixteenth the population of the world. The United States has about three times as many divorces as all the rest of the world, not counting Japan, which has a peculiar marriage custom. Now, some one will very likely say: "You are painting a very dark picture." This "picture" exists. This is just a little conversation about it.

The other day Secretary Hoover of the Department of Commerce commended "housewives" for not buying sugar because of the profiteering prices. Does Secretary Hoover not know that "housewives" are almost institutions of the past? The great fruit and vegetable canning establishments and the bakeries that bake the pies and cakes now buy the bulk of the sugar sold. The high price of sugar, and so forth, is added to the cost of food and meals when bought at the bakeries, restaurants and lunch counters.

Has the feminist movement, in all its phases, been contemporaneous with the rapid growth of these conditions in the United States? Are the feminists foreign or American?

A Modern Disraeli—By a Washingtonian

Concluded from page 3

thing in my life, Mr. President, when you gave me the chance to work for America in this way."

One can almost hear him chant:

> "Some for the Glories of This World; and some
> "Sigh for the Prophet's Paradise to come;
> "Ah, take the Cash, and let the Credit go,
> "Nor heed the rumble of the distant drum"—

Even though that rumble be the rising discontent of the millions whose dollars are paying for the plans hidden under the smother of lotus leaves.

And how like the Disraeli of that bygone Victorian day!

Truly, nothing Disraeli ever spoke or penned to his queen could surpass in magnificence this lip-tribute of his modern prototype, Mr. Lasker, advertising agent from Chicago. Disraeli, if he were able to look down from the mystic plane of "that bourne from which no traveler returns," must have been proud of his twentieth century reincarnation.

But apparently Mr. Lasker wot not in those moments to—

> "Think, in this batter'd Caravanserai
> "Whose Portals are alternate Night and Day,
> "How Sultan after Sultan with his Pomp
> "Abode his destined Hour, and went his way."

and apparently nobody suggested it to him, not even the President.

Now read a little further the words of this Modern Disraeli:

"I think the board is in shape now to account for itself. And I believe that *IN YOUR SECOND ADMINISTRATION,* Mr. President, it will prove itself the greatest accomplishment of your presidential career"—which proves conclusively that the advertising agent from Chicago had nothing in mind at the moment remotely resembling the warning of the Tentmaker that—

> "—Sultan after Sultan with his Pomp
> "Abode his destined Hour, and went his way."

The Modern Disraeli believes, apparently, that his potentate to whom he has given his undying devotion has a couple of destined hours coming to him, so in one breath the President is told that his Shipping Board can now stagger along without the strong, ever-present arm of Mr. Lasker about it, and Mr. Harding is renominated, re-elected, reinaugurated—and launched successfully upon his second term without even the irrepressible "Ned" McLean having had a chance to give Mr. Harding an inaugural parade. Truly, a super-Disraelian accomplishment.

Little heeding that—

> "—we, that now make merry in the Room
> "They left, and Summer dresses in new bloom,
> "Ourselves must we beneath the Couch of Earth
> "Descend—ourselves to make a Couch—for whom?—"

even though that is the way of modern politics, it was apparent that the quatrain which the advertising agent from Chicago prefers from the Tentmaker's many is the one which runs something like this:

> "Ah, make the most of what we yet may spend,
> "Before we too into the Dust descend;
> "Dust into Dust, and under Dust to lie,
> "Sans Wine, sans Song, sans Singer, and—sans End!"

Anyway, after Mr. Lasker's speech everybody applauded—the President blushed and several giggled as they exclaimed—"Isn't he superb!" Of course no one could tell whether they meant the President, or the Modern Disraeli, advertising agent from Chicago.

Starlit Skies, Lilies, Tinted Lights Go to Make Up Scene of Festal Beauty

SO IN a bower of roses, under the twinkling of amber and blue lights "which gave the impression of a starlit sky," the modest Mr. Lasker handed Mr. Harding a second term in the White House, without the bothersome formality of consulting the people of the country at all—and the electric fountain played on in its myriad colors, while countless pink ramblers swayed gently in the artificial breezes of the invisible electric fans.

As the servants, "garbed in quaint colonial costumes of white silk with lace frills and silk stockings," flitted as soft-footed and silently as did the turbaned servers of Takht-i-Jamshyd, like bedizened but ghostly wine-pot bearers amid the ruins of Persepolis in those long-gone hours of Hafiz, serving a few hummingbirds' tongues here, a little heart of "young baby's breath fern" there, some Cleopatra sauce of pearls-in-vinegar to this guest, and a few candied petals of young orchids to that, the President enunciated to the assembled guests that "I haven't discussed and won't discuss the details of our program, because I want you to be sure of your ground, and hope you will come with a pretty unanimously supported program when the time comes for its presentation."

Adding that the plan for government operation is but temporary, the President said he was "ready to accept any alternative to promote the American merchant marine."

So, thus, amid riotous oriental splendor, and under the subtle languor of the lotus are public leaders lulled into a sense of false security, these days in Washington, little dreaming that—

> "With them the seed of Wisdom did I sow,
> "And with mine own hand wrought to make it grow;
> "And this was all the Harvest that I reap'd—
> "I came like Water, and like Wind I go."

The President's words irresistibly recall his mysterious reference in his New York speech before the Associated Press, to the intention "aggressively to operate the fleet until Congress shall inhibit."

Can it be the President, knowing the program—the real program—believes government operation under the Lasker plan will be such that Congress will "inhibit," and thus pave the way for "our program" which "I haven't discussed and won't discuss until the time comes for its presentation"?

Unmindful of the people, who are supposed to elect, or at least to vote for their choice for President, the Modern Disraeli, this advertising agent from Chicago, launches Mr. Harding into his second term. May all the credit be his!

Unmindful of the people, who have paid more than four billions to date for the white elephant he and Mr. Lasker tried to team up with the party mastodon—without the Cabinet being once consulted—and which Mr. Lasker has been leading around by an advertising prod-hook—which he led up to the subsidy pasture—then led away again, Mr. Harding declares he has not discussed and "will not discuss our program"—the plans for the merchant marine which is eating up somewhere between sixty and one hundred millions of the people's money each year, except to say that a super-expensive plan—Lasker's plan—of government operation through subsidiary private corporations whose accounts, the doughty Controller McCarl, of the accounting arm of the government, cannot search into and cannot interfere with, is "a temporary plan."

> "A Hair, perhaps, divides the False and True;
> "Yes, and a single Alif were the clue—
> "Could you but find it—to the Treasure-house,
> "And peradventure to THE MASTER too!"

No! Such things as details for the merchant marine without which Mr. Lasker sees "no hope for Americans in the future," are not to be discussed with the people who pay the bills. These are matters to be whispered only in mysterious inuendoes in the small gathering *which did not include a single member of the Cabinet,* in the midst of rose bowers, cedar-boarded walks, electric fountains playing rainbows under "starlit skies" of "amber and blue lights twinkling down upon tables banked with American Beauties and pond lilies" which "alone cost more than $1,000."

While the blushing Mr. Lasker, advertising agent from Chicago, is presented—as a Modern Disraeli could quite properly expect—with a silver plaque by the Shipping Board—*whose members,* he at one time is quoted as having told the press, *would be dismissed by the President if they disagreed with Mr. Lasker*—President of these United States was figuratively—almost literally—embracing the head and master of the Lord & Thomas Advertising agency and kissing him good-bye, as Lasker prepared to embark upon what the New York *World* has denominated "the million-dollar-joy-ride" in the giant, palatial "Levi Nathan," as Sam Hellman in the *Saturday Evening Post* refers to the rehabilitated *Leviathan.*

As the modest Mr. Lasker, advertising agent from Chicago, prepares to obtain the free advertising which Arthur Brisbane recently said "he could not buy for $10 000,000," and as the retiring Chairman of the Shipping Board prepares to entertain several hundred "guests" including many newspaper correspondents, who are, of course, expected to repay Mr. Lasker, Chairman of the Shipping Board, for the honor of being invited on his yachting party at the expense of the people of this country, by writing what Mr. Lasker, advertising agent from Chicago, wants written, this Modern Disraeli receives the Godspeed from President Harding.

And Now Comes the Question—And Who Will Answer—Who Paid the Bill?

WHILE farmers in New Mexico, Iowa and Oklahoma, and business men all over the country, are struggling, striving, growing gray with worry over how they are to face the future and make ends meet, one wonders how they will take the news of this love-feast between their President and this Modern Disraeli, the millionaire advertising agent from Chicago, in a bower of roses, hydrangeas, peonies, pond lilies, electric fountains, served by silken-garbed, lace-frilled, gauze-stockinged waiters.

One wonders who paid for all this. Was it the same burdened souls who have dug deep into their sorely needed store of savings to pay out the four billions and more for the keep of the white elephant? Or was it Mr. Lasker, advertising agent from Chicago?

If the Shipping Board paid for any such party as the one described, it will without doubt hear from the people.

If the Modern Disraeli, the millionaire advertising agent from Chicago, paid for his own flowers over the footlights, it would not be surprising at all but certainly in wretched taste.

Now, just who did pay for the flowers and the silken costumes, and the playing fountains, and the "starlit skies"?

The people would like to know.

And just how much did the food cost, if the decorations cost more than a thousand dollars?

Possibly the other commissioners paid for it all.

But the people would like to know.

The Hamilton Hotel, where this oriental feast was held, could tell—if it would.

Just how many were at the dinner? Newspapers say the members of the Shipping Board, Mr. Harding, and George Christian. Were these all? Could nine, ten or a dozen guests use a thousand dollars' worth of decorations besides the food?

And why were no members of the Cabinet—like Mr. Daugherty, for instance—at the feast?

Could it be possible there is any fear or jealousy reminiscent of the Disraelian era of old between the members of the President's official advisory family and Mr. Lasker, advertising agent from Chicago?

And since the President broke his attorney-general's heart by his stinging rebuke for Mr. Daugherty's announcement that the President would be a candidate for renomination, will it transpire that Mr. Harding will now confound with stinging words the bold reference to "your second administration" made in his presence and directly to him by the modest, albeit inimitable, Modern Disraeli, Mr. Lasker, advertising agent from Chicago?

Let us wait and see.

And, meanwhile, what of the pronouncement of Miami—that Mr. Lasker would manage Mr. Harding's 1924 campaign?

Is it by a series of such oriental feasts, where the decorations alone cost nearly a hundred dollars a guest, that the advertising agent from Chicago intends to "sell" Mr. Harding to the country in 1924?

One wonders, as one reads further the lines of the Tentmaker:

> "And lately by the Tavern Door agape,
> "Came shining through the Dusk an Angel shape
> "Bearing a Vessel on his Shoulder; and
> "He bid me taste of it; and 'twas—the Grape."
>
> "The Grape that can with Logic absolute
> "The Two-and-Seventy jarring Sects confute;
> "The sovereign Alchemist that in a trice
> "Life's leaden metal into Gold transmute:"
>
> "Oh, Thou, who didst with pitfall and with gin
> "Beset the Road I was to wander in,
> "Thou wilt not with Predestined Evil round
> "Enmesh, and then impute my Fall to Sin!"

And, yet, who knows? The ways of politics are peculiar, and the people are aroused. Perhaps—

> "Yon rising Moon that looks for us again—
> "How oft hereafter will she wax and wane;
> "How oft hereafter rising look for us
> Through this same Garden—and for One in vain!
>
> "And when like her, oh Saki, you shall pass
> "Among the Guests Star-scattered on the Grass,
> "And in your joyous errand reach the spot
> "Where I made One—turn down an empty glass!"

South America's Poor Lo Declared a Victim of Federal Peonage System

Indian Woman of Latin Countries Held to Be Equal and at Times Superior to Man

By CARROLL K. MICHENER

This is one of several travel articles by Mr. Michener

Bolivian Indian in reed balsa, Lake Titicaca.

AT GUAQUI, the southernmost port of Lake Titicaca, which is known to every schoolboy as the highest navigable body of fresh water in the world, the morning newspapers from La Paz informed us in solemn types of a "grave menace—the atavistic cruelty of the Indian," stalking at that moment among the populace of the *altiplano*. It appeared that South America's Poor Lo desired "to overwhelm in torrents of blood the predominance of the civilized race."

This was interesting to us, if for no other reason than having just passed through the very focus of this aboriginal outbreak. The Yapura, upon which we were wafted leisurely across Titicaca, had loitered all night off Desaguadero, a lake village that divides itself impartially between Peru and Bolivia, expecting to be of some possible assistance in the landing of troops. A Peruvian army of 100 men was ready to brave an assault by savage hordes of an identical complexion.

For three nights Desaguadero's handful of inhabitants had not slept. They had the news that a neighboring village had been sacked and the population massacred. The police were under arms, an under-nourished spy had been captured, and the telegraph's burning appeal had finally moved the military of both Bolivia and Peru.

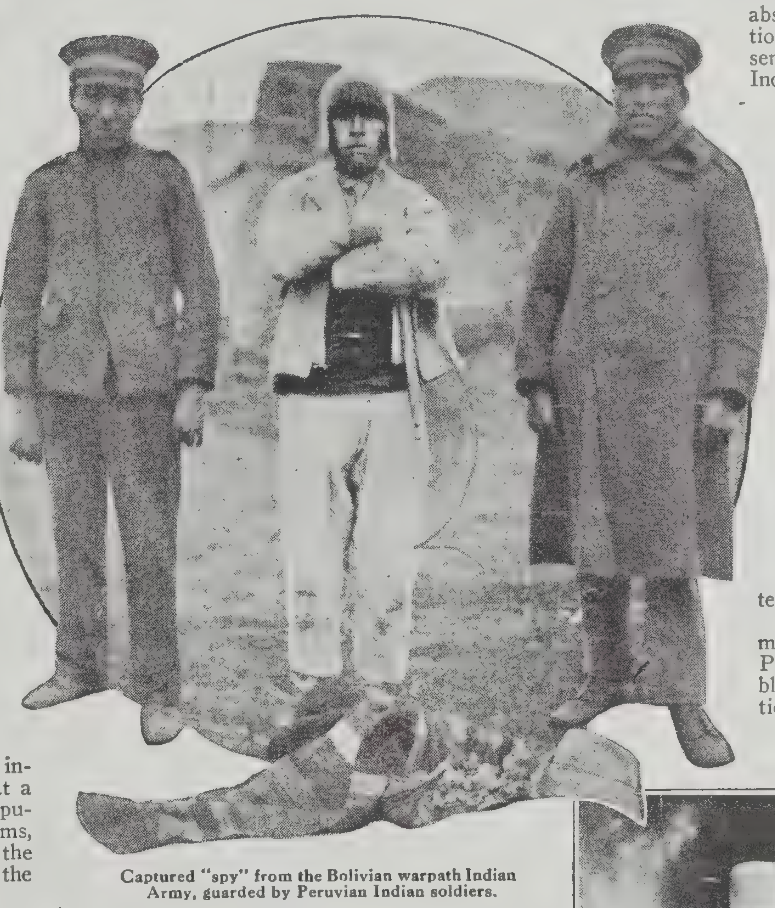
From the newspapers we learned, indeed, that the rebellious Indians, using rifles, shotguns, sticks and knives, had killed the mayor of Jesus de Machaca, the priest, and others not definitely enumerated.

This, then, was one of the South American red man's last feeble reprisals so thoroughly earned by the cruelty of the Iberian freebooters five centuries before. And it was against such a pitiful and comparatively ineffectual outburst of atavism as this that the editorial writer of *La Verdad*, heir to the unparalleled atrocities that hide themselves under the golden title of the Spanish Conquest, was loosing his bitter complaint.

As for the cause of the uprising, the editor was willing to state, frankly, that it lay in the feudal system of land tenure and peonage existing in varying degrees from the northern boundary of Mexico to the Straits of Magellan. It was confessed in his rhetorical paragraphs, at least by inference, that the descendant of the Incas was little better off today than in the chaotic times of slavery and spoliation following the overthrow of the Incas.

The *encomienda*, of course, vanished generations ago. The Andean Indian is no longer bound to the soil by law. Theoretically he owes the landowner nothing and is free to go about as he will. But actually, for a number of reasons, he is as much of a slave in some of the interior regions as he ever was. He tills the soil but he rarely owns it. The landed proprietors are chiefly of Spanish descent, many of their holdings dating back to the general division of spoils in Pizarro's day. They permit the Indian to live upon their estates, in return for which he is obliged to cultivate the land, retaining for himself only a meager share in the product of his husbandry. This vanishes speedily, as a rule into the landowner's store, to supply the Indian's absorbing demand for liquor and *coca*. For these and his necessities he is usually in debt to the proprietor, his only means of payment being labor. A certain amount of personal service he owes in any case, although the law does not uniformly smile upon this relic of feudalism drifting down from the period of the Conquest.

The conditions under which the Indian pursues his melancholy existence vary according to geographical position, but, generally speaking, there is a graduated improvement in his lot the farther south he is from the Isthmus of Panama. In Colombia the farm laborer is still in the grip of a social system that belongs to the Middle Ages; in Argentina, except for the handicap imposed by large estates owned by absentee landlords, he is abreast of modern times. Between these extremes there is very little of the free agricultural labor that is known to the United States. Political and social reformers have done a great deal, at least in theory, but in fact there has been no great mitigation of the practical slavery to which the native was subjected by the conqueror. The South American apologist insists that the Indians have proved themselves incapable of helping themselves, and that laws for their protection and improvement beat against a thick wall of indolence. This inefficiency he attributes to the patriarchal system of the Incas, under which the inhabitants were vassals of the state, owning nothing and owing everything to the royal house. He is likely to maintain that the Spanish *encomienda* varied little from this Inca exploitation, and that it became odious only through the abuses to which it was subject in the hands of the rapacious colonists.



Captured "spy" from the Bolivian warpath Indian Army, guarded by Peruvian Indian soldiers.

It was not clear to us just which one of the Andean Indian's grievances against the "dominant race" was uppermost in his present revolt; and as for the massacre of Jesus de Machaca, it did some violence to our previously conceived notion of the South American indigene's subservience, stupidity and general lack of initiative. Except for infrequent minor stirrings of this kind, the bondage of the Indian of Bolivia and Peru has been endured without resistance since the great rebellion of Inca Tupac Amaru in 1780. That uprising was but a half-hearted one, although it resulted in such bloodshed and cruelty as to make it the last case of general resistance.

Save for particularly savage tribes in Southern Chile and Argentina, the South American redskin does not appear to have been so great a fighter as his brethren of the northern continent. Fewer wars of extermination were necessary. When Columbus sailed westward the North American Indian was still in the hunting stage and could not be enslaved. But the Inca tribes had reached a comparatively high degree of civilization. They were in the agricultural stage of human progress, and ripe for conquest. It was necessary for them to stand or fall where they were, for, unlike the less cultured tribes to the south, they were unable to revert to a guerrilla existence in the untamed mountains and plains. Their lives were too deeply rooted in cities and the soil of their farms. And highly organized as was the Inca state, the battle prowess of their armies seems to have been ornamentally overrated by the grandiloquent Spanish chroniclers, eager to celebrate the exploits of their countrymen's arms.

The racial conquest of South America was accomplished less by war, therefore, than was the case in the northern continent; it was conquest by a process of absorption rather than of ejection and extermination. The present heirs of the conquerors—the essential South Americans—are neither Spanish nor Indian, but a blood mixture of both.

The North American Indian was doomed, it might be said, when the first white woman came ashore with the Pilgrim Fathers. This is not to assert, of course, that she "arose from her knees to fall upon the aborigines" with any more sanguinary intention and effect than did her mate. The red man would have been submerged by the persistent white colonization from Europe even if she had stayed at home, but it is possible that he might have had a better chance to endure as a racial entity or to perpetuate himself as a more perceptible component of the American people.

To speculate upon what would have occurred had the colonial dames kept to their distaffs on the other side of the Atlantic until such time as America had been made safe and snug for them, is idle, of course, but there is a morsel for reflection in the case of South America, where that is exactly what happened. The southern continent today has a tremendous population of unalloyed Indians, customarily estimated at ten millions, but its prevailing cast of countenance exhibits a generous blending of native tints.

True, there were in the North Atlantic settlements an occasional John Smith and an infrequent Pocahontas, but the early infusion of aboriginal blood thinned to an imperceptible trickle against the tide of white men. This vanishing streakage was never palpably reinforced. The Indians of North America were fewer and more widely scattered than those with whom the *conquistadores* came into dispute in South America, and this is an important factor in the divergent result. But the Spaniard, no doubt from long contact with the Moor, drew no such

The *chola* (half-caste) who is the brightest figure in all the Andean landscape.

An Indian woman of the Upper Andes.

Breaking Down the Immigration Barriers

Concluded from page 6

which was filed with you. In addition to this, he appeared at Ellis Island and stated that the subject was making most satisfactory progress and that within a year or two her mentality would be normal. He stated that her mental deficiency was not inherited, but resulted from her experiences in Galicia during the World War, when she had been compelled to live in cellars for days without food and her mental deficiency resulted from the fact that during this period she was undernourished. He stated that she was recovering very rapidly, spoke English fluently, and would become perfectly normal if she were permitted to remain in this country. Notwithstanding the testimony of eminent physicians and surgeons, you again ordered her deported. I took another appeal to Washington and was informed that under the ruling, the decision reached by the Medical Board at Ellis Island was conclusive.

"At my urgent insistence, another examination was given her at Ellis Island, as a result of which she was again ordered deported. In view of the testimony given by eminent physicians and surgeons, the deportation of this child can be attributed to but one of two causes; either racial prejudice or resentment by the authorities at Ellis Island toward the authorities in Washington. I say racial prejudice, because I am advised that in one or two other cases, where patients were feeble-minded or on account of their age had no chance of recovering their lost mentality, they were promptly admitted under bond, without the use of 'political influence.'

"In conclusion, permit me to say that the deportation of this helpless child back to Russia, in view of all the facts and circumstances of her case, rivals in infamy and iniquity the execution of the consecrated priest by the Russian Soviet Government."

The Commissioner's Answer

COMMISSIONER TOD promptly replied to this communication as follows:

"I am not in the habit of making statements 'without full knowledge of the facts,' and in a matter of this kind, it would appear that I am in a better position to know all the facts regarding any immigration case than you.

"The records of this office show that the case of Riwa Trompeter originated in 1920. There is abundant evidence on record that political influence was used to permit her to be admitted on bond temporarily on these specific conditions:

" '. . . . She is temporarily admitted for one year (on condition that she be meanwhile placed in an institution for defectives at the expense of her friends and that a bond for such expense and for her return with an attendant be given).'

"This temporary admission, for one year only, was granted November 1, 1920. At this time not only was the alien feeble-minded and mandatorily excludable, and her case not subject to appeal even to the Secretary of Labor, but she was also mandatorily excludable because of her having favus, a loathsome contagious disease. I cannot find that you were her attorney at that time.

"When the year was up, she was ordered produced at Ellis Island for further examination, November, 1921. She was not produced. Instead, political influence again intervened, and she was taken to Washington to be examined.

"On November 29, 1921, a request for an extension of her time to remain in this country was denied, except for a stay of sixty days on this condition:

" 'This stay of sixty days is granted on the condition that before it is made effective, her relatives will agree in writing that deportation will be had within that time, and that no further request for an extension will be made.'

Political Influence Used

"IN ADDITION she was to receive treatment for favus in a proper institution, and the stay of sixty days was granted solely to permit her relatives to make arrangements for her return. Political influence was still in force. Again the bondsmen failed to live up to the agreement and it was necessary for the bureau to advise that steps be taken to 'effect the alien's departure from the country.' Still no action was taken, and January 15, 1922, deportation was again ordered. Again some influence was at work.

"February 3, 1922, a re-examination before the full Board of Public Health surgeons was ordered, with instructions that if she should again be certified for feeble-mindedness, she was to be deported. Bondsmen were advised to present her here for examination February 6, and they ignored the demand.

"February 17, her attorney was notified to produce her here for re-examination, and was permitted to have an expert present.

"February 21, she was again certified for feeble-mindedness, and the physicians stated that it would be necessary for her to go to a hospital in order that an examination could be made regarding the claim that she had been cured of favus.

"March 22, the department issued a warrant of arrest, and for her father as an accompanying alien, under Section 18, and declared that the bond had been breached. More political influence was sought, but the bureau wrote to her attorney:

" '. . . . The Department has acted very leniently in the premises, and has given the girl every possible opportunity to convince the United States Public Health Service in Washington and New York that she is not feeble-minded. The certificate of the Public Health Service is final and conclusive. When, therefore, the alien is certified to be feeble-minded, the department must perform its ministerial duty and direct deportation.'

"This was on July 11, 1922, almost two years after her arrival here. You were notified on July 25, that hearings would be accorded this alien and her father on July 31. Under warrant proceedings a new bond was given by the National Surety Company, and the aliens were released from custody after their hearings.

"September 2, the department ordered deportation.

"On October 12, the National Surety Company was directed to produce both aliens at Ellis Island on or before October 21, for the purpose of their being photographed and giving information. The bondsmen on the first bond, given November 20, were notified that that bond was breached, and ordered to make payment on or before October 27.

"You were notified as to the proposed deportation of the aliens. Although you had gone on record as assuring Inspector Conry that 'of course the alien will do whatever she is ultimately ordered to do,' you advised this office that you were going to Washington to appear before the Board of Review.

"On November 7, the National Surety Company, not having followed instructions to have the aliens appear, the matter was again referred to the bureau. On November 14, the bureau advised that another opportunity be given the bondsmen to present the aliens, and failing to do so, the bonds be declared breached. (This was the second bond—the first had already been breached.)

"On March 12, 1923, this office was notified to deport the aliens. On March 19, the National Surety Company was notified that the bonds had been breached. Not until March 29 was the girl located.

"On March 24, the situation regarding all feeble-minded cases had become intolerable and I took the matter up with Washington. Not only were my actions approved, but I was assured of staunch support in my attempt to administer the law, and that all cases were to be handled in the same manner.

"As to the charge in your letter that I picked the cases of Ruth Trompeter, the Sas family and 'Sammy' Goldman, I have to inform you that this statement is absolutely false and in line with equally irresponsible statements. They were not picked by me, but fell into my hands unsolicited, and I, as a government officer, was forced, if I were to be true to my oath of office, to take action at once.

"Your Statement Insulting"

"I TAKE particular exception to that portion of your letter which states that the deportation of this child can be 'attributed to but one of two causes, either racial prejudice or resentment by the authorities at Ellis Island toward Washington.' I consider such a statement unwarranted and insulting. I challenge anyone to show a single act on my part, since I assumed charge of Ellis Island, which would indicate the slightest bias on my part as regards race, religion or creed. On the contrary, the files are filled with unsolicited testimonials from various welfare organizations representing all races and religions, as to the honesty, fairness and tolerance of my administration in this respect. None have been more outspoken in praise than have been the Hebrew Immigrant Aid and the Council of Jewish Women.

"As to your racial charge, you are advised that I understand that of the cases admitted on bond, approximately forty-two are Jews. This fact shall not deter me from doing all that lies in my power to effect their deportation. On the other hand, it does not influence my actions. I am interested in the welfare and the future of this country, and this country has no place for any feeble-minded aliens of any race, who are here illegally.

"Your conclusion that the deportation of this child to Russia is on a par with the execution of the consecrated priest by the Soviet Bolshevists is beneath notice. I shall leave the American people to judge whether there is any resemblance between a feeble-minded alien, afflicted also with favus, mandatorily excluded by the laws of the United States and granted privileges not even allowed by law, and a consecrated religieux, whose execution by an outlaw government has shocked and revolted the world. It may interest you to know the viewpoint of the American people in this effort made to rid the country of aliens here illegally. Your letter is the only protest I have received. On the contrary, I have been amazed by the spontaneous outburst of approval on the part of the American public.

Congratulated on Stand

"WHILE I have not before me the specific cases in which you appeared here, I must call your attention to one fact, that the immigration laws are going to be administered here in absolute accordance with the work of Congress in placing them on the statute books, and in the honest administration of those laws, I intend to guard the privileges of the immigrants as assiduously as I do the rights of the United States."

Mr. Felder replied to this letter with another, but Commissioner Tod ended the discussion with the following brief sentence:

"Riwa Trompeter having sailed on the Steamship *Mauretania* today, the incident is closed."

In the flood of congratulatory letters that have reached the commissioner, there is one from Professor Robert DeC. Ward, of Harvard University, who writes:

"Best wishes in your struggle against the political and other influences which oppose you."

Mr. E. R. Johnstone, director of the training school at Vineland, New Jersey, devoted to the interests of those whose minds have not developed normally, after noting a clipping concerning the case of "Sammy" Goldman, writes:

"I am sure every institution man in the country will agree with your statement that 'It is better to face the facts and realize that it is cases such as this which lead to the filling of our institutions with foreign deficients, when our asylums are too crowded even to take care of the American-born."

Twelve Hundred Miles on Great Lakes

Concluded from page 9

in-Bay, noted for its connection with Commodore Perry and the Battle of Lake Erie.

Soon after leaving Point Pelee the steamer joins the procession of vessels—carriers of ore, of coal, of grain—that passes to and from the Detroit River, Lake St. Clair and the St. Clair River, where, for nearly one hundred miles, Ontario comes within hailing distance of Michigan.

At the entrance of the St. Clair River from Lake Huron is Port Sarnia, favorite of Canadian vessels, which shares with Collingwood, Owen Sound and Port McNicoll, on Georgian Bay, the honor of sending out palatial passenger ships and receiving heavily laden cargo carriers.

It is not enough to study the wonders of Georgian Bay from a steamer. It is far better to take a few days on a motor boat or on one of the little vessels that make daily trips among the fringe of rocky islands that find shelter close to the eastern shore of the bay. The islands are popularly said to number thirty thousand, but it might be as accurate to speak of the Forty Thousand Islands of Georgian Bay; probably no one would question the accuracy of the estimate.

And what islands they are! Islands that are mere dots in the water, and islands that cover many acres; islands bare and islands covered with thick woods. But all are rocky and each offers a restful summer home to some family from the noisier regions far from the water.

When, at length, Georgian Bay with all its wonderful islands must be left behind, it is found that the way toward Sault Ste. Marie is all but barred by Manitoulin Island, the Island of the Great Spirit, where the Indians who had long gloried in the possession of the islands of Georgian Bay—Chippewas, Ottawas and Saugins—accepted Manitoulin in exchange. The agreement was made, in 1836, at Manitowaning, a town in the eastern part of the island. The descendants of these Indians now live on a reservation, while settlers occupy most of the island that was promised to the savages.

Beyond the St. Mary's River lies Lake Superior, the tremendous inland sea that is father of the Great Lakes. The vessel is soon out of sight of land, for few islands break the great sweep of water. One of the few islands, Michipicoten, close to the northeast shore, since its discovery in 1760 by Alexander Henry, has been visited by many seekers after gold and copper, who have called it "The Island of Yellow Sands."

South America's Poor Lo a Victim of Peonage

Concluded from page 13

color line as the men of upper Europe. Aside from a few picturesque exceptions, wives of the Spanish conquerors did not accompany them on the great American adventure, and it was long before they followed in any considerable number. No wave of agricultural peasantry came from old Spain to the new lands unlocked for exploitation by Pizarro and Cortes, for the lust of the conquistadors was for gold rather than for acres of Indian corn. After the first years of slaughter, therefore, the native population was tolerated. Quite otherwise than in the case of the North American settler, the Spaniard saw no advantage in pushing the Indian away from the soil. The adaptable Don, after putting the men to work, took the women to wife.

The result of this policy, for the Indian, was, paradoxically, both extermination and perpetuation. While he was vanishing in thousands under the lash and the white man's liquors, his blood was being made imperishable by absorption into the conquerors' veins. Under the system of tribute and forced labor he was worked to death in the fields and mines, or succumbed to tuberculosis in the coast regions, the airs of which were fatal to his high-altitude lungs. Nevertheless he persists in the race mixture that constitutes the South American of today.

The Indian woman, who is at least the equal if not the superior of the male, is in this and still another respect one of the mothers of what seems to be approaching a new and homogeneous racial type. Into her care, or into the hands of her *chola* daughter, the children of indolent and aristocratic white women are confided, with the result that some of her inherent aboriginal ideas are passed on into the blood and brain of the dominant caste.

No doubt there was a vastly greater population of natives under the Incas than there is today. This follows not alone from the facts of massacre, disease and devitalizing slavery, but is attested by the ruins of human habitations scattered over wide regions that are now practically deserted.

Estimates of the population of South America at the time of its discovery are, of course, conjectural. The Incas are said to have ruled over eleven millions in Peru, where less than a quarter of that number are living today. Only one-eighth of Peru's present inhabitants are pure white, however, so that it may be seen how little lacking to the Indian is progeny.

Character Imprints—Phrenology's Falseness

NOT very many years ago, professional phrenologists traveled through our country collecting money in the name of science. The theory of "cranial bumps" was first announced about the year 1796 by the Viennese physician, Franz Joseph Gall. This eccentric investigator derived his theory by comparing the "cranial topography" of a large number of persons with their individual moral and mental endowments. Gall held that he had proved that the brain was composed of faculties or special organs which gave to the skull its particular and individual contours which corresponded with the size of the organ located at any given portion of the cranium. A big "bump" signified a large organ beneath. Promontories due to the accidents of domestic life, of course, must be excluded in a diagnosis by a reliable phrenologist. Cranial contour maps, generally called phrenological charts, added their due impressionistic weight to the atmosphere created by the professional phrenologist. A complete map consisted of the seven grand divisions: perceptives, reflectives, moral, self-perfecting, aspiring, animal, and domestic. Each one of these grand divisions was subdivided into related functions. For example, the class "aspiring," generally, included self-esteem, firmness, approbativeness, conscientiousness, cautiousness, and sublimity. Each one of the sub-functions was assigned to a particular location within the contour limits of the grand zone, "aspiring."

This theory of Gall concerning the brain is utterly false. It is now common knowledge that the surface of the brain is furrowed by *fissures* between which appear the so-called convolutions. The two deepest *fissures* are called the *fissure of Rolando* and the *fissure of Sylvius.* Instead of the "cranial contours" of Gall we find the brain subdivided into areas which have to do with the *general sensations, particular sensations, muscular or motor control area*, and the *association areas.* In the drawing, the *motor control area* is at the left of the fissure of Rolando. This area controls the muscles of the toes, foot, leg, and so on. The *sensory area,* pertaining to such *general sensations* as temperature, pain, pressure, and so forth, is located at the right of the fissure of Rolando—refer to the drawing. The areas which deal with such *particular sensations* as hearing, vision, smell and taste have been definitely located, with the exception of the last mentioned. The remaining portions of the brain area are taken up by the so-called *association areas.* It is the business of these areas to co-ordinate and elaborate the experience derived through the sensations into thought and knowledge processes.

These facts are sufficient to explode the phrenological theory and render it useless in character analysis. The most that can be said for this theory is that the general shape of the head is a crude index to individual character.

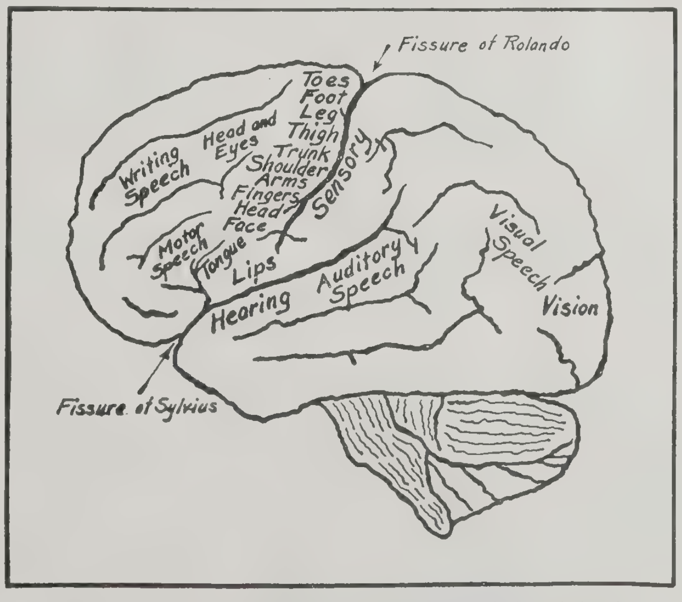
Physiognomy was studied by the ancients. Aristotle, the famous Greek philosopher, is the author of the first work on physiognomy. The play of the features and mimicry did not enter into the considerations of the ancients. This study is a modern departure. The valuable treatise by Professor H. Krukenberg, entitled "Der Gesichtausdruck des Menschen" (published by Ferdinand Enke, Stuttgart, 1923) is a contribution which deals in a thorough manner with this modern phase of the problem.

The modern scientist does not seek for *character imprints* in the fixed portions of the human head. Common sense tells him that immobile parts cannot serve as a receptive mold for the impressions and conscious reactions which arise throughout the life of a thinking and emotional human being. Therefore he turns to the movable portions in order to discover those *imprints* which tell the story of the individual reactions to experience which, collectively considered, constitute a person's character. The mobile portions of the face around the eyes and the mouth constitute the field wherein the physiognomist finds his most valuable data.

Some persons, believing it advantageous for purely personal reasons, have developed, with a measure of success, a type of control which makes it difficult to discover clues to their conscious reactions. They prefer to hide, if possible, any outward tokens of their feelings, emotions and intellectual conclusions. The successful Wall Street gambler knows the value of the "poker-face." It is a valuable asset both to the card-shark and to all the varieties of the "gentleman highwayman" with which our civilization is infested. The mask, however, is never perfectly impenetrable. Honest men are naturally suspicious of those who incase their soul life within a protective insulation built up for the purpose of deceiving people. We do not advocate the abandonment of self-control, but we deplore the fact that fraud is often made possible by facial restraint.

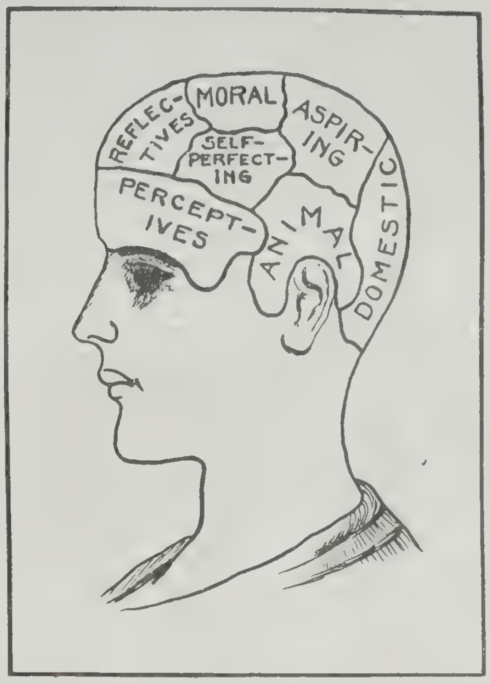
The traces of our psychic processes can never be totally removed from our face. The continual recurrence of certain thoughts, feelings, mental attitudes and reactions eventually leaves imprints which nothing less than a changed character can modify. We can truly state that the facial expression is an index to the soul. The man whose life is mostly made up of physical labor shows this fact by a tenseness and a more or less strained condition of the muscles of the mouth. The brain worker's *imprint zone* is principally localized around the eyes. The dreamer can be discovered by studying the region around the eyes, which for this type conveys the impression of reflective thought turned inward. The scientific type, on the other hand, conveys the impression that thought is outward-bound toward physical things. That profound thought involves effort is apparent from the accompanying contraction of the eyebrows. Pain produces the same effect. The difficulty and exertion involved in deep thought are closely related to pain. The effect of pain upon the zone of the eyes is well illustrated in the head of Christ, painted by the famous Italian artist, Guido Reni. The well-known Laocöon group, in the Vatican, is an illustrious example of the Greek sculptor's recognition of the significance of the eye zone in depicting pain. The sculptors of ancient Greece and Rome generally provided their statues of men with furrows and wrinkles in the forehead to indicate thought, whereas these indications were conspicuously absent in their examples of women.

It was Darwin who established the fact that various psychic states are represented by the same imitative expression. In other words, the language of facial mimicry called forth by the various psychic states is a universal mode of expression and it is essentially the same for all nations and races, whereas the expressive movements of the body and limbs change according to habits and customs. A most curious illustration of the last mentioned variation in the manner of expression is cited by G. Nordstrand in his excellent article, entitled *"Ansiktets Vittnesbord,"* which appeared in *Nya Dagligt Allehanda,* April 2, 1923. Nordstrand states that the great Swedish explorer, Sven Hedin, found a curious custom prevalent among the inhabitants of Tibet. Whenever they greeted each other it was by sticking out their tongues. We are certain that any attempt to introduce this Tibetan custom in the United States as a substitute for our "Good morning!" would end disastrously for the bold innovator.



Brain areas, according to modern psychology. Physiological psychology has shown that the brain is subdivided into areas dealing with sensations, muscular control, and association of ideas.

The great German philosopher, Immanuel Kant, was aware of the influence of a facial expression upon the mood of the person. In recent times the eminent psychologist, Wilhelm Max Wundt, has shown conclusively that the relationship is reversible and that on the one hand, the psychic attitude calls forth certain expressive facial and bodily motions, while on the other hand the play of features and gesticulation influence the psychic mood and attitude. Pideret, the famous physiognomist, has substantiated the theory that the facial expressions gradually form the physiognomy into a permanent facial cast which indicates the person's character.



Phrenological chart, according to Franz J. Gall. Modern psychology has shown the theory of phrenology to be false.

Professor Krukenberg's work deals principally with his researches in the field of imitation and mimicry. He states that the evidence of intellectual work must principally be found in the eye and forehead zones, whereas the play of the emotions leaves its imprints around the mouth. A heightened and happy mood may be initiated by raising the lips and cheeks, and a depressed feeling may be brought about by the relaxation and lowering of the corners of the mouth. By lessening the tension around the lower jaw, the mood is depressed. When this condition is habitual, a general state of despondency prevails. In Nordstrand's summary of the work of Krukenberg, to which we are in part indebted for the data presented in this article, the physiological mechanism by which the psychical states are revealed through facial expression is explained. A large number of small muscles are located under the skin. When these muscles are contracted the skin is creased and furrowed. In this way the familiar lines of the face are formed. The entire mechanism by which these muscles are set into operation consists, according to Krukenberg, of four principal co-operative functional elements: first, the psychic centers; second, the brain centers which control the muscles of mimicry; third, the nerves which connect these brain centers with the fourth factor, that is, the facial muscles of mimicry. Those facial muscles which are used most become the strongest and fold the skin into definite creases. When the skin's elasticity disappears, these grooves or creases remain in those positions where they have been formed most frequently, thus determining the permanent facial expressions. This is the procedure by which the psychic processes place their imprints on the face. Those psychical processes which are often repeated are the ones that leave the most permanent traces. We may say, then, that the soul drapes itself in a facial garment which, in greater or less degree, reflects its own nature and character.

Under the skin, we also find a plastic mass of cells that serve as an elastic filling, which gives form and stability to the face in proportion to its content of blood and cell liquids. This content may readily be varied by the changing psychic states. Intense emotions, as fear and pain, have the effect of decreasing this content with the result that the skin's elastic properties are decreased, thus causing portions to hang loosely over the cranial structure.

Character imprints grow more definite and distinct with age. Our thoughts and feelings are summed and recorded through the facial imprints. The comeliness of youth may disappear, but an acquired beauty of the soul may take its place as a lasting imprint of a character built upon the permanent foundation of lofty thoughts and kind deeds.

BRIEFLY TOLD

A concrete tower 600 feet high is to be erected at Wembley, near London, England, to give visitors a view of the surrounding country. A searchlight powerful enough to be seen from the coast of France will be installed in the tower. A cage will make the trip to the top of the tower spirally.

As an experiment the Santa Fe Railroad has employed some 400 Pueblo Indians as track laborers.

Above the lowlands of Guatemala there are rich table-lands rising as high as 6,000 feet, with a delightful climate. Here are grown several crops, such as sugar, coffee, maize and rice, as well as various varieties of fruits. Above this 6,000-foot level are the cold lands where wheat, potatoes and other temperate climate plants thrive.

Charles Young, the only Negro ever to rise to colonel's rank in the United States Army, was buried at Arlington Amphitheater, May 21. Colonel Young was graduated from West Point in 1889. He served in the Philippines, in Indian campaigns and as military attaché in Haiti and Liberia.

Fossil remains of a dinosaur found near Ehrlien, Mongolia, by American explorers, prove that the animal was carnivorous. Evidence of this is indicated by the teeth and the structure of the skeleton. The creature stood on legs ten feet high and its body was about 90 feet long. It weighed almost 90,000 pounds and is regarded as intermediate between a lizard and a bird and of the same common stock as the present-day alligator.

Universal suffrage is in force in Sweden.

Thousands of foreigners are waiting on the Mexican side of the Rio Grande to be smuggled into the United States, according to immigration inspectors of Federal District No. 22. Organized bands of smugglers put the foreigners over the line for ten pesos ($5) a person. The inspector stationed at Laredo estimates that 300 foreigners at Nuevo Laredo are awaiting transportation across the border.

The Chinese prefer to see their own people acting out Chinese plots in the films to the most distinguished foreign talent surrounded by all the marvelous technique of the business as we know it in America. They want Chinese life depicted because it is the only life they know.

Thirty-two thousand colored farm hands have migrated to northern industrial centers from Georgia alone in the past year.

Sir Conan Doyle's famous detective stories of Sherlock Holmes have been barred from the libraries of Inverness, Scotland, by the authorities who have charge of the county education. They say the stories have a corrupting influence on youth.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

"Unless sensible men come to the rescue, we shall have a government of laws, with a statute governing our every action," says Bruce A. Campbell, president of the Illinois Bar Association. "Paternalism has become the order of the day. Good law is good sense, and good sense is to be determined by the deliberate judgment of the generality of the people."

W. W. Husband, Commissioner of Immigration, in a recent report states that the recent immigration restrictions are having their desired effect in reducing the number of persons coming to the United States from Southern and Eastern Europe and in increasing the number from the British Isles, Germany, Holland and the Scandinavian countries. This means that the new citizens of the United States are of the same stock as the original settlers of the country. The countries last mentioned are now sending their full quotas to the United States, something that has not happened for several years.

A French professor has discovered a process of grafting plants by means of which perfumed flowers grafted on plants that heretofore had no scent at all results in the product of the grafting smelling like the original. A wormwood grafted on a chrysanthemum produced flowers which gave off a perfume much more powerful than that of the original plant.

Jews from Poland and Russia who for the last two years have arrived in Mexico with the intention of entering the United States, and who have been turned back at immigration stations because of the immigration laws, are still in Mexico. A prominent Jew of El Paso says they have settled in various parts of Mexico, in towns where no Jew ever resided before, and are now supporting themselves.

So finely balanced are the doors of the Bank of England that a clerk, by pressing the button under his desk, can close them instantly, and they can be opened only by special process.

A jail, a chapel and a morgue will be included in the Chicago Union Station now under construction. The jail will be used for holding prisoners passing through Chicago and will eliminate the necessity of prisoners being handcuffed to officers while waiting for trains. The chapel will be complete and will be equipped for funeral services.

President Harding says: "The nation had deliberately, after many years of consideration, adopted the present policy, which is written into the Eighteenth Amendment. It is the law of the land and of every state within the Union. So long as it remains the national policy there can be only one course for the National Government to pursue—that is to use every means to make effective the law passed in compliance with this constitutional mandate. To do this will be the unquestioning policy of the present administration, and I may add that I am finally convinced that it must be the policy of other administrations that shall come after."

It is now possible to travel from London across Europe in less than 30 hours through the collaboration of the continental railways with the airplane companies. Passengers may leave London in the late afternoon, catch the 7:45 p. m. Orient express at Paris, arrive at Strassburg at 3:30 in the morning and take an airplane for Bucharest or Constantinople. The last lap of the trip between Belgrade and Bucharest is made at night in a machine with a triple motor, and Bucharest is reached about 10 p. m.

To aid in preventing the ruthless destruction of wild flowers, loss by fire, pollution of streams, and littering of picnic grounds and camp sites, a "Hill and Mountain Club" has recently been organized in Tulare County, California. The members take the following oath: "I pledge myself to leave the hills and mountains as beautiful as I find them; to observe and aid in the enforcement of all measures intended to preserve their natural features, and to respect private property and the rights of others."

M. Dizengoff, mayor of Tel Aziz, Palestine, is in New York City to float a municipal bond issue, the first one in Palestine in 1,850 years.

Un-American and Un-Christian

The spirit of America, the cornerstone of this beloved country of ours, is tolerance, justice and fraternity. The tenets of no religion preach the hymn of hate. Christ said "Love thy neighbor." The holy commandments say, "Thou shalt not bear false witness against thy neighbor" and "Thou shalt love thy neighbor as thyself."

The real American, the real Christian—and this is a Christian nation—cannot countenance injustice and racial or religious hatreds and intolerance and remain a true American. In this nation every man stands before his fellow countrymen upon his merits as a citizen, upon the merits of his character and his record. If this is free America and if this is Christian America it matters not of what race he is or what creed he subscribes to in the determination of his worth as a citizen.

Religious and racial intolerance is a menace not only to the spirit of America, but destructive of everything that is finest and best in our human relations. It is a wholly wicked and indefens

The front page of the Dayton *Journal* after the publisher "fired" his city editor and bent his knee to a Jewish Rabbi.

IN DAYTON, OHIO, the right of the Christian pulpit and the press to discuss freely the Jewish problem, as they do the Japanese, Mexican or Turkish problems and other racial and religious matters of public interest, has been audaciously challenged by a certain imperious Hebrew faction.

Rabbi Samuel S. Mayerberg, of the Jewish Temple of Dayton, seems to be engaged in a determined effort to make plain to this famous city that it must "crook the pregnant hinges of the knee where thrift may follow fawning" so far as newspaper or pulpit mention of the Jews is concerned, notwithstanding the Federal constitutional provision that forbids "abridging the freedom of speech or the press."

The manner and results of the savage onslaughts of Rabbi Mayerberg, following the report in the Dayton *Journal* of Monday morning, April 23, of a sermon "The Jew—Is He a Menace or a Messenger?" delivered Sunday morning by Dr. J. M. S. Isenberg, pastor of the Central Reformed Church of Dayton, are full of significance to thoughtful citizens who are being dismayed by the encroachments of certain minority Jewish leadership on the free press, free speech, and in this case the freedom of Christian religion and non-sectarian community organizations.

It must be conceded that Rabbi Mayerberg and his associates have these immediate and outward results to show for their prompt reprisals:

First, the instant discharge of the city editor of the Dayton *Journal* who printed the report of Dr. Isenberg's sermon upon the Jew;

Second, an unprecedented front page editorial-apology, signed by the publisher of the *Journal;*

Third, the palpable throwing open of the news columns of subsequent issues of the *Journal* to Rabbi Mayerberg's bitter attack upon Dr. Isenberg, as well as laudatory articles about the business affairs of certain Hebrews;

Fourth, the seeming coercion of the Dayton Community Chest by offended Jews under the rabbi's leadership;

Fifth, the reported understanding that the rabbi would be placed upon the Dayton public school board as a "reward" for his work upon behalf of the community, a conspicuous part of which has been this raid against Americans who wish to continue to think and speak with independence.

Thus Dayton has felt the knout upon its back as promptly and harshly as any Gentiles in Russia who have dared to question the Jewish-Bolshevist excesses in that unhappy land.

It is but fair to Dayton to say that much of Mayerberg's success came from his combining cleverness and cunningness of plan with a surprise attack. The people of Dayton now appreciate the extent of this invasion of their self-respect and constitutional rights, and resent it accordingly. It has been useful in demonstrating to them the oppression that will obtain whenever a certain sort of Jew obtains the whip hand.

Dr. J. M. S. Isenberg, pastor of the Central Reformed Church of Dayton, is a man of mature years, whose education and successful record qualify him to serve his present charge. He is a native of Huntingdon, Pennsylvania, and during the last eighteen years he has served the church in Philadelphia. Several of those years were spent in charge of a church in the ghetto, so that Dr. Isenberg knows the Jew of whom he speaks.

The congregation of the Central Reformed Church of Dayton is one of the most representative and conservative in the city. It worships in one of the most prominent and impressive church buildings in Dayton.

When Dr. Isenberg decided to preach a series of sermons upon different features of American life, including one entitled, "The Jew—Is He a Menace or a Messenger?" he laid the plan and an outline of his proposed sermons before the members of his board and obtained their concurrence.

In pleasant contrast with almost everyone else concerned, Dr. Isenberg has acted in an ethical manner throughout the affair. He did not request the publication of the sermon—the manuscript was not even tendered to the press. The city editor of the *Journal* made a special request that he be supplied with a written outline of the sermon.

Certainly Harry McClain, the luckless city editor of the *Journal,* cannot be accused of employing offensive headlines for the printed report of the sermon. The headings included such sentences as: "Problem of Jew Is Discussed by J. M. S. Isenberg."

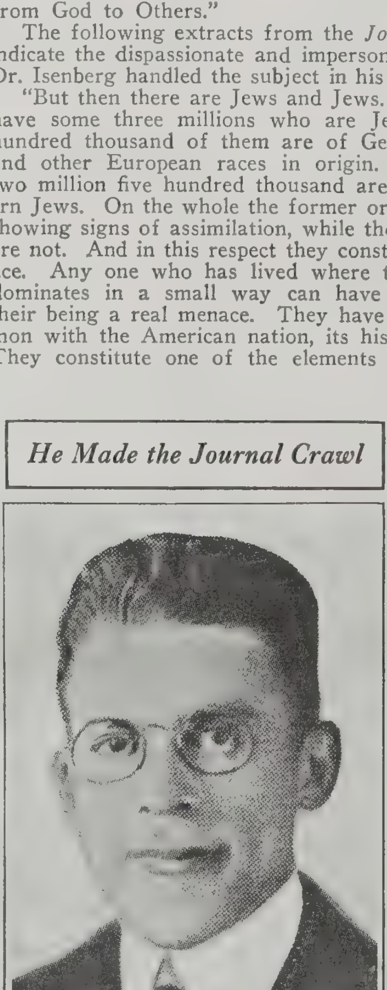
"Three Million Are Making Home in U. S."

"History of People Shows Them to Be Messengers from God to Others."

The following extracts from the *Journal* article will indicate the dispassionate and impersonal way in which Dr. Isenberg handled the subject in his sermon:

"But then there are Jews and Jews. In America we have some three millions who are Jews. About five hundred thousand of them are of Germanic, Austrian and other European races in origin. The remaining two million five hundred thousand are Polish or Eastern Jews. On the whole the former or lesser group are showing signs of assimilation, while the latter or larger are not. And in this respect they constitute a real menace. Any one who has lived where this element predominates in a small way can have no doubt about their being a real menace. They have nothing in common with the American nation, its history or its aims. They constitute one of the elements that openly and above board is working for the overthrow of the existing order of society.

He Made the Journal Crawl



RABBI SAMUEL S. MAYERBERG

DAY IS DAWNING

"A new day is dawning for the one group of Jews among us, but for the other there is likely to be a night of gloom and doom. The former group is being led by men who have caught the true spirit of America and are seeking to have the term Jew stand for a denomination who believe in God and worship according to ancient rites and ceremonies. The other group is led by aliens whose sole purpose is to perpetuate a race with its animosities, many of which are self-caused, in a country where every demand of the nation is that we become one in ideals and ideas and one in race under the style and title of American.

"First, the Jew needs to understand that America is a Christian nation. Ninety-seven per cent of her people are Christians and the institutions which have made America great have had their origin in Christian conceptions. The Jew must therefore respect these institutions and cease his efforts to undermine or very speedily he will find his position anything but pleasant or promising.

MUST OBEY LAWS

"Second, the Jew needs to cultivate a wholesome respect for the laws of the land, including the eighteenth amendment and the Volstead law. Seventy-five per cent of the brains and money of the bootlegging in this country is supplied by those who are Jewish. They constitute the leaders in the efforts to break down the laws governing Sunday. There is a whole area in the life of America, chiefly our larger cities, where things thrive that spell ruin to others which are in the hands of the Jew either as the promoter or the owner. These things he must give up and the leaders of Jewish thought and morals must demand that their people cease to do them if they hope to enjoy the confidence and esteem of the average American.

"Finally, he must cease his attack upon American institutions. No one will object to his study of Karl Marx and his kind, but we do insist that he study American history, imbibe the spirit of '76 and '61. His heroes must be found not only in the ancient world and the literature of the radicals of the day, but also in the men and institutions which have made America great."

It so happened that several Jews were in the congregation that heard Dr. Isenberg deliver this sermon, and upon its conclusion a Jew came up and introduced himself to the pastor and expressed himself in agreement with the statements made. In fact the sermon was delivered in such a restrained manner and so properly qualified that none who heard it considered anything prejudicial to good Jewish citizens had been said.

The reaction of Rabbi Mayerberg, who is quite a young man, almost a stripling compared with the veteran and well-poised Dr. Isenberg, a point which should be borne in mind, especially when reading the extracts from Mayerberg's reckless "sermon," was suggestive of a disturbed wasp.

Rabbi Mayerberg called Dr. Isenberg upon the telephone Monday morning, while the latter was eating breakfast, and tartly said he took exception to the

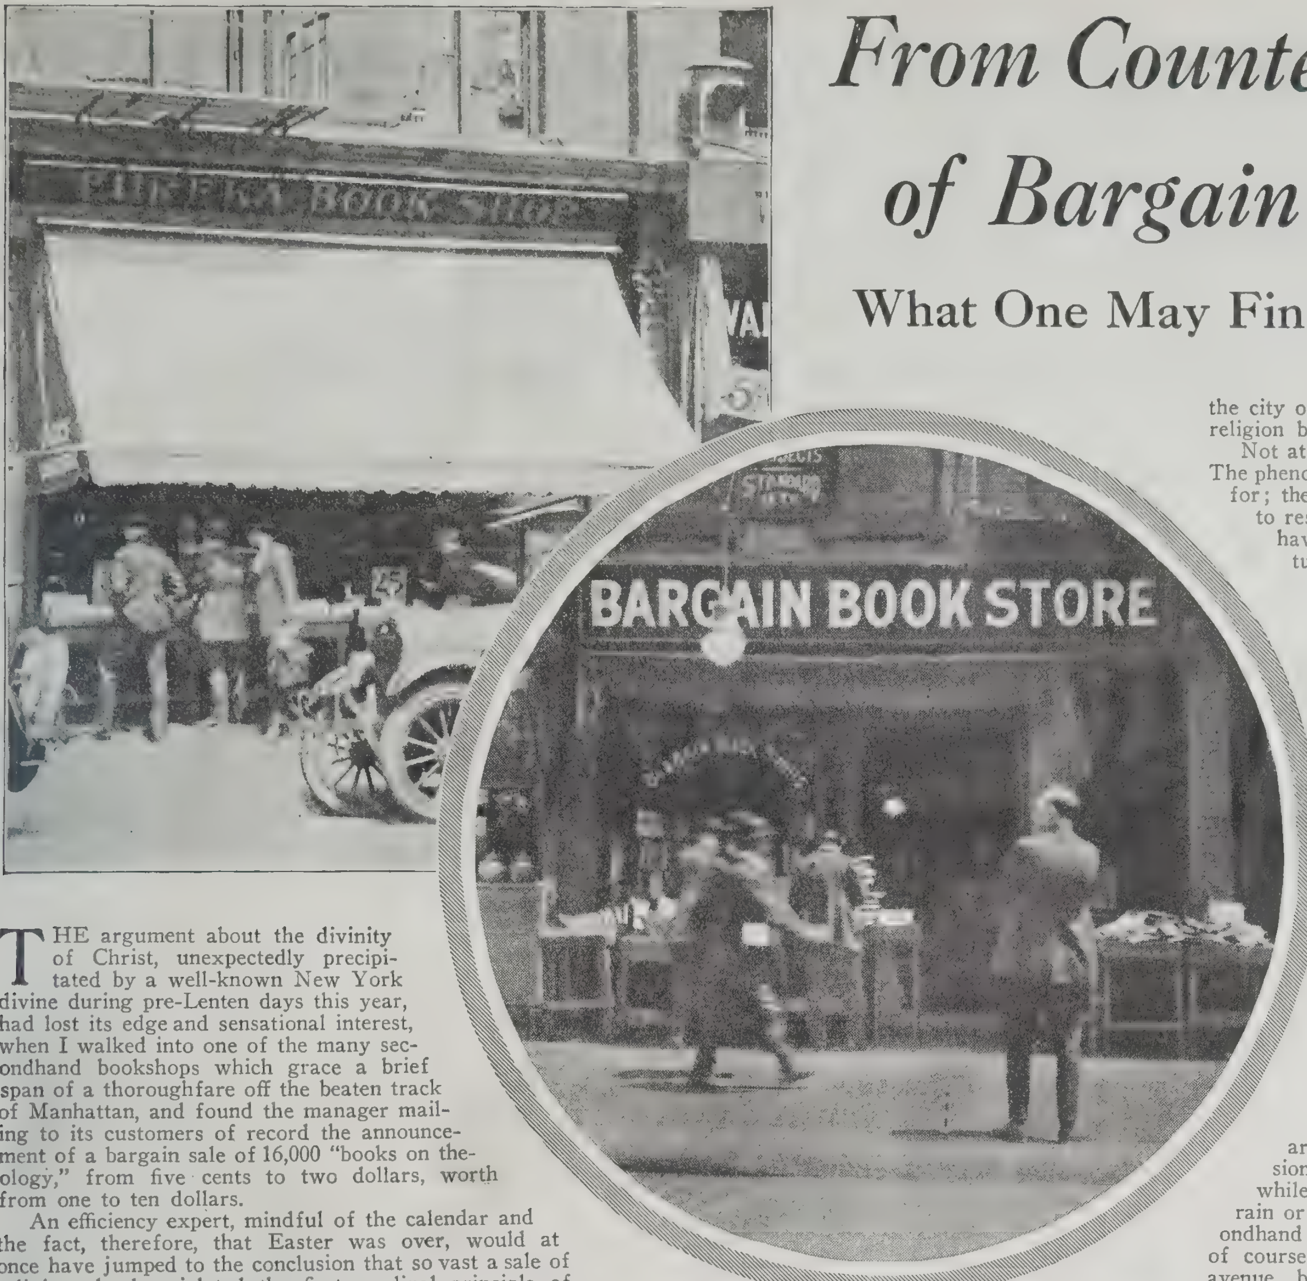
From Counter to Counter of Bargain Bookshops

What One May Find in Gotham Search

By an Amateur Tome Hunter



THE argument about the divinity of Christ, unexpectedly precipitated by a well-known New York divine during pre-Lenten days this year, had lost its edge and sensational interest, when I walked into one of the many secondhand bookshops which grace a brief span of a thoroughfare off the beaten track of Manhattan, and found the manager mailing to its customers of record the announcement of a bargain sale of 16,000 "books on theology," from five cents to two dollars, worth from one to ten dollars.

An efficiency expert, mindful of the calendar and the fact, therefore, that Easter was over, would at once have jumped to the conclusion that so vast a sale of religious books violated the first cardinal principle of business—timeliness. Sixteen thousand books could not be considered a clearance sale.

"Wouldn't you have done better during Lent?" I inquired of my friend, the manager, with that hazy efficiency idea in my head.

"There's no closed season for books," he smiled, "and especially for religious books. In a few days they'll all be gone!"

"What? In New York—the supposed cradle of municipal and civic wickedness, the supposed shrine of the God Gold—do they buy religious books by the thousand, and on bargain tables at that?"

"There's a sale beginning tomorrow," the bookman said, "but no matter how many religious books you'll bring in, I'll buy them all. There's a customer for every book."

In three weeks the bargain tables had been well picked over and thinned out. Where books on religion and theology had been stacked now there were lurid-jacketed "popular novels of the 1921 and 1922 vintages," the unsold and unsalable stocks of publishers who need their shelf space for the forthcoming editions of printed froth.

The moral? Aye, a moral and a sermon, too.

For here there were new books, almost smelling of printer's ink, prisoned between unopened leaves a year or two after leaving the presses, already being sold as old and as junk, for which any price would be a good price. Fancy and even suggestive titles, vivid covers and chromatic effects, endless advertising—but withal destined to be readerless and reach the macerating machine without the comfort of a befriending human glance.

Glance aside to the table containing the theological books. For twenty-five cents I buy a beautifully tooled and gold stamped morocco bound book entitled "Palestine, Past and Present, with Biblical, Literary and Scientific Notices," by Rev. Henry S. Osborn, A. M. It was published in 1859 by James Challen & Son, of Philadelphia. It is a book that is worth $5 of anybody's money. One associates it with the painstakingly chosen library of one of the solid brownstone houses that were homes. It looks well today on a modern desk; it looked, perhaps, much better upon one of the black walnut marble-topped tables of two generations ago.

Its exquisite steel engravings by John Sartain and Samuel Sartain; its restful wood engravings by Louderbach and Hoffman; the curious chromographic engravings, duly signed, which at the time were both a rarity and a luxury; its wide margins, its beautiful clear and large type and its velvety paper which must have felt the touch of loving and delicate fingers—they peer at you. Here is a book that although old is always new. It can always be resold—and there will always be someone to buy it.

This is one book picked up at random from thousands. Most of these books have been reread innumerable times from title to colophon, and will be reread as long as the leaves stick together. They are generally books bearing imprints of one, two, and even three generations ago. One is amazed by the hundreds of books written about the Bible. There are as many books about religions and sects and every subjoined belief and shade of opinion.

Every one of the larger bookshops of the kind has the five-cent tables, and these tables are generally full of theological books, well used, but always interesting, and although the tables are always stacked, the books keep moving. Not a few of them are carefully marked or underscored, some by the precise and careful hand of the divinity student, some by the blotted scrawls of children taking their first lessons.

The last few years have witnessed a great increase in the secondhand bookshops of these theological books, an increase that in some instances seems disproportionate in comparison to other kinds. Is it because the city of New York has become less religious? Has religion been on the decline?

Not at all; Bible House sells more Bibles than ever. The phenomenon, if such it has been, was soon accounted for; the war, the dearth of home space, the necessity to restrict living quarters and to expand living units, have caused many of the homes of the past century, full of printed treasures, from a literary standpoint, to yield to the path of alleged progress—alleged, because not all progress has been real.

The fifteen-inch bookshelf of the modern flat, whose contents periodically are cast into the dumbwaiter, has taken the place of the more solid library of our fathers and grandfathers. One must have the novel and the short story for diversion, to be sure, and reading matter in a lighter vein should synchronize with the era we live in, but the vast unsold stocks of the mushy reading, when compared to the continuous and active market for the literature of the past, tells *the* story.

Buy a novel for two dollars, and without unwrapping it take it to a secondhand bookstore. You will get fifteen cents for it; you may get twenty-five if you are lucky. But the worst of the mid-Victorian books, no matter how poor its cover condition, will bring a better price, and apart, of course, from special intrinsic value of edition and date.

The secondhand bookshops of New York are an institution. To see the endless procession of men and women, boys and girls, tarry a while, is no mean spectacle. Summer and winter, rain or shine, wind or calm, they stop and look. Secondhand bookshops are scattered throughout the city, of course, but the headquarters are on lower Fourth avenue, between Fourteenth street and Wanamaker's huge department store. The tables, in general, are weatherbeaten and show evidence of many nails and braces. But rather than book tables they resemble the vegetable stands of any market.

These tables are for books which sell up to 50 cents a copy, all higher-priced books being sold within, and it is an unwritten law that these books are sold at a low price because they will not be wrapped or delivered, notwithstanding that this rule is not enforced. It all depends upon the customer. They are left outside, and a passer-by could easily pilfer one or two books if so minded, but these losses are virtually unknown. There are pilferers, but they usually operate within the shop, and naturally their taste is for expensive or rare books.

The secondhand bookshop is operated, above all, for the student, and the student is a serious person. He may be wealthy and thrifty, and he may be poor but ambitious. The booklover is given every opportunity to browse about, unmolested, to examine any and every book, and in Schulte's, for instance, which has its lateral racks so arranged as to form so many nooks, one can stay there, virtually unobserved, for hours.

Secondhand books are their own salesmen. And nothing yet devised or discovered in the field of modern supersalesmanship surpasses an assortment of books where the chance passer-by can see them. If he stops he will look; and if he looks he will buy. The nickel purchase is as important as the five-dollar purchase. There is no such a thing as the piker in bookbuying; at least the secondhand booksellers have not found said genus.

The hectic tales about New York, and there have been many, and some based on truth and fact, have always given Fifth Avenue or Broadway as the center of the stage. The stage is usually set for the nighttime. But what of the bookworms? They are everlastingly at it. The public library, with its countless branches, is usually well filled every night, when perfervid New York is supposed to be at play. A few are curiosity seekers, or persons come to obtain some special information, not infrequently to settle a wager, but the majority is a studying crowd. It is the very counterpart of the crowd that likes to finger old books whenever occasion presents itself.

Contrary to general belief, financial want is the last and least of the conditions which make customers for the secondhand bookshops. These carry charge accounts; they act as agents for collectors and for the rare-book houses which specialize

(*Concluded on page 9*)

There are always many who have time to browse through the stands and shelves of the bookshops, as the photographs taken in New York and shown on this page prove.

To Wets and Drys—Both of You!

DID it ever strike your mind that the subject of Prohibition may be made such a steaming issue as to conceal other matters of importance to this nation?

Concede that today Prohibition is the most discussed single subject in this country—do you see how it is to the advantage of certain interests to have you both so blinded by it that you can't see anything else?

At every crisis of the public mind the shrewd strategists of Privilege attempt to create a diversion. Nothing was ever done contrary to the people's interest when the people were steadily looking on. But if a side fight could be started to draw off the people's attention, the evil thing could be accomplished.

It is not intimated that Prohibition is a side fight. Indeed, that is where the big politicians are hugging themselves with joy. They have a fight that looks like the main battle to use in this campaign—they can ring the changes on Prohibition pro and con, until the whole population is drawn off from the question of whether Privilege is to reign longer over us.

Think it over.

One instance comes to mind. Only a few months ago the financial power of the East was sending out cries of alarm, it feared that the country was to be swept by a demand for a revision of the system by which the people's money rights were leaking away to the people's greater impoverishment. All guns were set in that direction. It was from that side that battle was expected.

Then began a flank movement. From the very seat of False Finance there came out this new Prohibition challenge. Little by little it rose like a smoke cloud. New York State repudiated her dry law. Fires of the same kind were laid in other states. Presto! the public interest flamed, the concentrated attention of the people drawn off. Prohibition was made the smoke screen.

Mr. Wet, this applies to you, too. You are just as much duped as anyone else. Both Wet and Dry ought to join hands and push through the smoke screen to see what their common enemies are preparing to do on the other side.

A Terse Editorial

MONEY, which describes itself as "a free magazine and forum devoted to investigation of the prevailing parasitism," says in its July issue:

"After reading *Money* for April, Arthur Brisbane, editor of the New York *American*, says:

" 'No one ever changed a social system suddenly. You have to change the people first—and they change slowly.'

"When Mr. Brisbane discusses sociological questions, he writes more like one of the 'common herd' than like a high-salaried editor of a metropolitan journal. What he says in the above quotation, though plausible, is not so! Wise action on the part of fewer than 300 citizens of the United States will change its social system 'suddenly' and in a way to benefit and delight ninety-five per cent of the 'people'!"

The President Quits

TO DAVID LAWRENCE was given the nasty little job of assuring the public that Mr. Harding has stopped drinking. It was perhaps the most humiliating piece of publicity that has marred the whole Harding Administration. If this is typical of the kind of publicity that the Jewish journalist-advertising combination of Dave Lawrence and Al Lasker is planning for the coming presidential campaign, friends of Mr. Harding ought to intervene with any insistence that may be necessary to call off the pair. Respect for the dignity of the person of the President of the United States should have made such a dispatch unthinkable, not to say unsendable.

The details of the dispatch are too revealing. The change in the President's personal habits has come "in the last several months." That would be following the Florida trip, probably. There is also the bald statement that in the White House or on the golf links the President would drink out of proffered flasks. And the very careful statement is made that "at the White House" no liquor "has ever been served," that is, "at the table" "for official guests." Mr. Lawrence presumes too readily on the American people's ignorance of how long the official status can maintain itself.

The whole dispatch (published in the evening papers of June 27) indicates a perturbation within the Harding ranks. For six weeks the special services have been carrying into the offices of business men all over the country the information that the President's conduct at Chevy Chase had changed in view of the coming election. It was intimated by these special services that bold bad Democrats had been hiding around and watching for the purpose of getting personal material to inject into the coming campaign. Two of those services used an identical expression, namely, that "the President was cultivating an evangelical trend of mind." But all the time there was an anxiety expressed that people "in the know" should be informed that Mr. Harding had cut it out. And these people all knew it. The blatant newspaper dispatch which bore David Lawrence's signature was rankly unnecessary.

The President is to be congratulated, of course. He had only two courses open, either to go on taking a nip once in a while if he felt like it and was taking it out of legal stocks, or to stop short, as he apparently has done. Neither course warranted newspaper invasion of his privacy.

Incidentally, Mr. David Lawrence's article, which was evidently inspired at headquarters, intimates that our dry President will not be averse to a certain degree of wetness in the country after a respectable period of mourning has passed.

Proposed Peace Hall

IN THE northwest corner of the United States on the Canadian boundary stands the Peace Portal, the first arch in the world erected to celebrate peace. Before its construction its promoters could say: "Paris has its Arc de Triomphe, Berlin has its Brandenburg Thor; but in no place is there a memorial to peace." The old monuments commemorated war; but Blaine today has its stainless Arch of Peace. Erected at a cost of $125,000 and dedicated in 1921, it stands as a monument of 3,000 miles of unfortified international boundary and a century of unexampled peace and good will. On one of the doors is inscribed: *Open for 100 Years;* on the other: *May These Doors Never Be Closed.* Across the plinth in front is the legend: *Children of a Common Mother;* on the reverse: *Brethren Dwelling Together in Unity.*

At the dedication of the Peace Arch 15,000 people of the two nations assembled with their representatives and for four days the monument spoke through human voice of the common brotherhood of man. It became manifest that the Arch alone was insufficient to do the work for which it stood, and so it has been proposed that a great Peace Arch Hall be erected for annual assemblies and a rest room for tourists, each a complement of the other of national and international import.

Some idea of the large number of people to whom the great thought of peace would thus be presented may be seen from the number of travelers who passed by the Peace Arch in 1922. During the past year 81,662 automobiles crossed the boundary at this point, carrying in round numbers 265,000 passengers. These cars represented every state in the Union, Alaska, Hawaii, Porto Rico, the Philippine Islands, Cuba, Australia, every province in the Dominion of Canada, South America, and there was one from Europe. By train on the Great Northern Railway which passes within fifty feet of the Arch, there were more than 100,000 passengers.

The Peace Hall project has the enthusiastic support of the city of Blaine, through the city council, the Commercial Club, its churches and other organizations. The co-operation of Bellingham and Seattle is assured, while the cities of British Columbia have given equally favorable response. The city of Blaine would guarantee the maintenance and upkeep of the grounds and the hall.

Farmer O'Neal's Figures

FARMER O'NEAL, of Hutchinson, Kansas, and Warren Harding held a little confab the other day in a Kansas wheat field. It consisted largely of a monologue of figures produced and read by Farmer O'Neal. The President was an interested listener, for the figures introduced by Farmer O'Neal were those having to do with the cost of raising wheat and the profit resulting therefrom. And when Farmer O'Neal got through, the President of the United States realized perhaps more than ever before why the Great Middle West is little interested in World Courts and such things that have little or nothing to do with keeping the local bank Shylock from closing down on the southeast forty.

In Kansas, which is a representative wheat state, the cost of production of an acre of wheat, Farmer O'Neal told the President, is as follows:

Interest on capital value of land	$ 5.00
Plowing	1.50
Harrowing	.25
Drilling	.33
Harvesting	2.50
Threshing	2.25
Hauling	.72
Seed and seeding	.65
Total	$13.20

The estimated production of eighteen bushels to the acre, made by Farmer O'Neal, together with a calculation of costs and taxes having to do with a ninety-acre field of wheat, brought forth the astounding declaration, backed by the figures, that the net profit on the entire ninety acres would be approximately $4.

When the consumer buys a dollar's worth of farm products, less than thirty cents of the buyer's dollar reaches the farmer who produced the food. These are government figures. Speculators on the Chicago Board of Trade fix the prices against the consumers and deprive the farmer of his rightful profits. *At one time less than a half-dozen grain gamblers made more money in a week than all the farmers of Kansas combined made in a year.*

We do not require a market for our wheat and other farm products. Markets are already in existence. What we do need is a market that will compensate our American farmer, the man who does the real work, permitting him the return on his labor and investment to which he is entitled. There is no reason the farmer should not receive at least the same compensation as does his city brother. And but for the connivance of members of the organized "distributors" he would. Certain it is that the solution of this problem does not lie in the lending of more money to the farmer who is only asking that he receive a fair price for his products. Mr. Harding confesses a very frank pride in the administration's part in lending $400,000,000 to the farmers of this country. But this only means that the American farmer has been plunged $400,000,000 deeper in debt. It isn't more debt, but compensation commensurate with the amount of labor necessary to furnish the consumer with food, that the farmer asks.

The farm value of all crops in the United States, exclusive of cotton, tobacco and animal products, last year was approximately seven billion dollars. The value of this crop, on the basis of what the ultimate consumer pays, was approximately twenty-two billion dollars. The original producer of these same products received one-third *and the various middlemen received two-thirds.* And instances were disclosed where the consumer paid as much as *three hundred per cent more than what the producer received.*

Department of Labor statistics covering fifty-one cities show that since the high record of June, 1920, there was a decrease in the cost of living of twenty-two per cent. This decrease was in food—the product of the farmer. This product alone dropped from 219 in June, 1920, to 139 in 1922, and during the early months of 1923 it was around 142. But the farmer had to purchase material to operate his farm at the same high prices he formerly paid. In fact, during the past year many manufactured articles have increased in price. Metal products show a marked increase, in some instances thirty-six per cent.

The well-being of the family unit means the prosperity of the entire nation. Times are good we say. There is increased buying power; increased retail trade proves this to be true. Factories employing more than 500,000 workers, and representing all lines of endeavor, report increases of twenty-seven per cent in the number of employes and fifty-three per cent in payrolls.

Any prosperity which does not include the farmer and food producer is not to be depended upon. The farmer's dollar cannot continue to slump like the German mark; his dollar is entitled to the same consideration as any other person's.

Mr. Ford's Page

IT IS rather strange that the majority of people on the earth should think that the strain and struggle of life are from the physical side—"what shall we eat and wherewith shall we be clothed?" Travel the earth around and ask in every country what constitutes the problem of living, and you would be certain to hear that the great problem is the getting of a living.

It is probably not true that getting a living is the great problem, it only seems to be. Upon analysis the fact appears to be this: we have had a general difficulty in placing the "getting-a-living" business in its proper place among the bigger business of life. It has its place and a basic place, but the bigger the place it is allowed to fill, the less chance we have of ever compelling it to fill a lesser place. That is to say, if we allow it to shut out the sky it is very doubtful if we shall ever find spirit or ability to surmount it to such an extent as to dwarf it by the comparative bigness of such other interests as we are able to achieve.

Take the artist or the young mechanic with an idea, notice how subordinate the matter of subsistence is to the main work. Of course it is necessary, but if the artist lose his ideal and the mechanic his idea in order that he may have an extra pillow or dine off linen tablecloths instead of boards you can readily see how the problem of getting a living in that sense easily becomes the great problem of life—too great a problem, in fact—and shuts out all the rest.

> *GETTING a living is easy enough if you do not make it the main job. A living is the by-product of a life which counts for something in the general benefit. If it is made the principal object of life it sometimes becomes most difficult. But where doing one's work is the main thing the living just naturally happens, and not a poor one either. The men who get along best are usually interested in something more than "getting along." Everybody wants money and everybody needs money, but one of the secrets about money is that when you turn your face in the right direction and help the world get what it needs, the necessary money can't be kept away from you.*

So that it is a question whether, after all, we are ever right in saying that the getting of a living is the engrossing problem, the big job of life. If it is, it is because people have made it so. And as one observes here and there it would seem that too many people have made it so. "A man's life consisteth not in the abundance of the things which he possesseth," and the man who knows this will never lack possessions.

The secret of solving the "getting-a-living" business is in tackling it from a point above. You hear men sometimes say that they never had any difficulty in getting along—not rich men, but ordinary men who depend on the labor of their hands or upon the personal services they render. But when you come to know them you discover that their real business in life is something more than getting along. They have a service to give—that is their main business; they would rather be doing that than anything else in the world. They would do it anyway, pay or no pay; it is their existence. The almost inevitable result is that these men get along well.

Now, why is it? They tackle the business of getting a living from the higher plane of the business of giving a service of some sort.

It sounds rather platitudinous to say it in just that way, so let us try again to define the idea. The principle is this: *every plane is conquered from the plane above it.* Matter is conquered from the plane of mind. Disease is conquered from the plane of health. Here is a young fellow spending his money as quickly as he gets it. He is at the stage where he can never do anything but the silly little things—has a sense of helplessness when anyone suggests that he invest his money or himself in the big things. Suppose someone suggests that he buy a house and a lot and fill the house with furniture. In the foolish money-wasting stage such an undertaking would seem as impossible to him as moving the North Pole to Chicago.

His elders counsel him, his mother advises him, his father lectures him, his friends give him books which exalt thrift and other things—but have these any effect upon him? No, he is under the spell of helplessness to do anything but get rid of his money. He cannot conceive the thought that it ever will amount to enough to accomplish any substantial purpose.

And then along comes a slip of a girl, who says nothing to him at all and who certainly does not lecture him about money. And with her comes a new climate and it enfolds the boy and lifts him a little higher, grows him up in fact. And from that higher plane what is he not able to accomplish on the lower plane of money and goods! He gets his house and he fills it with furniture. The thing he simply could not do, he does.

Every plane is conquered from the plane above it.

That is why the economists have accomplished so little for the world. They think that economic questions can be settled on the economic plane. Never. You must go up one step. Economic questions will only be settled from the moral plane. Down on the economic plane too many of the "only practicable things" are wrong. Down where they are, the thing is true. When a man says that a twelve-hour day at the hardest physical labor is "the only practicable thing," on his plane it is true. But come up one step and it is not true. Economic questions are going to be solved from the moral plane. Industrial questions are going to be solved from the moral plane.

Why? Because every plane is mastered from the plane above it. On the moral plane the truth is, *whatever is right is practicable.*

Political problems will never be solved on the political plane for the same reasons. Political questions must be solved from the plane above. There is nothing self-redemptive on the political plane.

Now, if a principle is true in these larger things and not also true in the economic affairs of the individual who must depend on himself, then it isn't true at all. Truth runs a straight line from the nation's business of getting a living to the individual's interest along the same line.

That is to say, the living comes most easily when it comes as an incidental. And that is its true status—the incidental consequences of a man's real work. If you attempt to make it the first and biggest thing, the end-all and be-all of life, there may be difficulty. If it is permitted by reason of worry or greed or any other lower irritation to usurp the first place, it may become more and more difficult. But if it is kept in its place and the man's energies released to his real work, or to learning how to do real work, then it will always come in as an assured incidental.

In another article this matter will be resumed, but even though some things yet to be said may sound more practical, nothing more practical ever can be said than what has been said here about the planes.

To get the better of a situation, get above it. The same relative result will be achieved if you put it beneath you. Get it down where it belongs, or get yourself up where you belong. It may be a trifling bitterness to pride for a while—most people are slaves to the fear of having to start a little lower and, maybe, a little more honest. Slaves to appearances are always slaves to fear. The first task for some of us is to strike economic bed rock and begin to build solidly—keeping up with truth instead of with the Joneses. When you get economic bed rock beneath your feet, you are on top of the situation—you are on the upper plane of mastery.

When an individual, a married couple, or a family are where they are without debt, without pretense, they are never sordidly poor—you cannot make sordidly poor folk out of self-respecting folk. Their very honesty with their circumstances is a quality which attracts to them power to rise in the scale of material things.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Scores "Cheap Labor" Immigration Argument

Representative Johnson Points to Cost of Maintaining Alien Defectives

By AARON HARDY ULM

"ONE may be for or against many things in connection with foreign immigration and for many different reasons that deserve attention. But it is difficult for me to understand how anybody can make approach to this tremendous problem from the standpoint of the pocketbook alone. There may be good reasons for admitting more immigrants than are now permitted to enter the country, but that we need them for the purpose of making more money while the 'making is good' certainly cannot be one of those good reasons."

The speaker is Albert Johnson, Congressman from the state of Washington and chairman of the United States House of Representatives Committee on Immigration and Naturalization. Mr. Johnson probably occupies the most powerful situation having to do with any near-future change in the national immigration policy. Since he has been at the head of the House Immigration Committee, he has given great attention to the subject, on which he and his committee have conducted much research.

Mr. Johnson was expressing himself with reference to recent proposals from powerful quarters that immigration restrictions be lightened on account chiefly of a current shortage of common labor.

The Chamber of Commerce of the United States, at its recent annual meeting, endorsed a plan whereby the present "three per cent rule" would be lightened to the extent of permitting the admission of two per cent additional "selected" immigrants. No definite method of selection, however, has been worked out by the chamber.

Not an Economic Problem

THE National Association of Manufacturers is advocating a somewhat similar plan of "selection," with the view of getting through immigration a greater number of workers and farmers. Its plan contemplates, also, "distribution and supervision," with the view of returning immigrant laborers to their native lands when the need for them ends here.

Judge Gary, of the United States Steel Corporation, and other leaders among large employers are advocating similar measures—all arguing on the sole ground of economic need.

"Much strong argument has been put forth for these new proposals for the lightening of present restrictions on immigration," Congressman Johnson declared when asked to express himself concerning them. "But all the argument is based on economic grounds alone. Now immigration isn't and cannot be chiefly or primarily an economic or pocket problem.

"Immigration must be considered on a basis different from that on which we may decide other big questions, such as, for example, funding the European debts, and the tariff.

"We may need cheap labor but even if we do it doesn't follow that we need more immigration.

"For American civilization does not exist primarily to carry on steel mills, mines and factories. These are only means to ends, not ends in themselves.

"Immigration can have, and is having, tremendous effect on the ends at which our civilization is aiming. It determines the quality of our citizenship and will be the controlling factor in the maintenance or the decay of the American institutions typified in our form of government.

"It can determine what kind of race that of Americans will be when we become—as we have not yet done largely because of long continued and virtually unrestricted immigration—a distinct ethnological group. We are an immigrant people, and we have done well. But some years ago we reached a condition of non-assimilability, which means that before long we shall be unable to hold ourselves together as a homogeneous people unless we continue to apply a strong check on immigration."

An Uncertain Condition

"BUT what of the merit in the pure economic claims put forth by those who, on economic grounds alone, would lighten existing restrictions?" he was asked.

"In the first place, a so-called shortage in common labor is a vague and uncertain condition," he replied. "It is very hard to say just what is common labor or to say what on the whole it should be paid. At best I should say that the shortage is not more than two per cent. Ship a few carloads of workers into any community right now and you probably would have an over-supply of labor there. You can get common labor anywhere by paying enough for it. The ill effects on business of a labor shortage and high pay are not to be considered in comparison with the good effects. Besides, a shortage of labor is not necessarily a shortage of laborers.

"Even the slowing up of production on account of shortages in common labor might not be without its good effects. Everybody wants industry to hold at high speed but all of us know how it easily can attain dangerous speed. Over-production always results in sudden slowing down and brings about big unemployment, which is much more dangerous and hurtful than an overplus of jobs.

"There are many resources still open to employers who complain about the labor shortage, caused, they say, by restrictions on immigration. For example, the use of machinery in doing the work of the common laborer hasn't been applied nearly so extensively as in the saving of skilled labor. This is because in the past we usually have had, on account of unlimited immigration, a plenitude of common labor which was cheaper than the using of machinery in its kind of work.

"In Washington here, where they have a large supply of Negro labor, you see them taking up car tracks and laying new ones even in the periods of heaviest traffic during the day. Traffic keeps workers idle about half the time. Out West, where we have to pay much more for common labor than they do here, we cannot afford to use it that way. Work on the tracks is done during the late hours of night when there is little traffic.

"In Haiti recently, where Americans are building first-class roads, I noticed costly steam rollers standing by the roadsides, idle. Our representatives down there said it was cheaper to use native labor at thirty cents a day for packing down the roadbeds with hand implements, than to operate the machine rollers.

"There are no restrictions except health and the literacy test on immigration from Haiti or other West Indies Islands, or Mexico, or any other part of this hemisphere. If our big employers want to bring in people to meet a temporary shortage in common labor, why don't they take these West Indians, who are so numerous on many of the islands that they hardly can exist? Even in Porto Rico, our own territory, there is a greater excess of population than in any area of Europe equal in size. There laborers are eking out a miserable existence by working for thirty cents a day.

We built the Panama Canal largely with West Indian labor. Thousands of them would come to America to work for six months, or longer, and if the United States simply cannot supply from its own population the common labor it needs, legislation might permit the temporary admission of seasonal labor from these islands and from Mexico. However, I do not advocate that at present.

"But the big employers want southern Italians and Slavs because they will work long hours and at small pay, and at least for the first several years give no trouble.

"They always need some labor and they prefer the heavy-backed kind. The steel mill people have been talking for ten years of doing away with the twelve-hour day, but they have not done it yet. Besides, a steady stream of sheer laborers keeps the wages down, as statistics show.

"All such is gained at great future cost, even to the employers themselves. Some of our worst and most costly 'labor troubles' have come almost entirely from the alien element of our population.

What This Scheme Means

"THE two per cent additional selected immigration proposed by the United States Chamber of Commerce would be unsafe. It would mean a possible gross immigration of 600,000 a year. In spite of selection, there probably would not be more than 150,000 farmers and common laborers. During recent years this grade of immigrants has not averaged more than three per cent of all.

"A scheme contemplating the admission of 600,000 would mean ultimately the admission of at least 1,000,000 a year, which would be going back numerically to the old open-door policy, for it brought us in a net average of about that number every year. All brought in under a selective plan would have relatives—that is, wives, children and dependent parents—whom it would be difficult to refuse to admit. In fact, that is one flaw in the present quota law.

"The proposal that we select, distribute and supervise these immigrants, with the view of seeing that they return to Europe when no longer needed as workmen here, is untenable. We should and can exercise a much better method of selection than prevails now. Above all things, we should select at the source, rather than permit the countries from which they come to do it for us, as has often happened. It is not long since we had to protest against Rumania's policy of giving passports to America only to those persons that that country didn't want. And now Mussolini wants to dump his undesirables upon us. As far as other countries will permit, we must select prospective immigrants.

"But distributing them arbitrarily after they come and supervising them while here—that is, making them live and work how and where we tell them to—is another matter. It can't be done without revising many of our treaties with other countries and repealing our laws against contract labor and peonage. They say it is done in Canada. It is not. Canada offers free lands, which is another matter. Moreover, the whole population of Canada is only about 8,000,000. Canada has no great industrial cities, and certain types of Old World immigrants are not striving to get into Canada. And Canada, with the United States as an example, is very watchful. She turns back with an iron hand. For the year ending March 31, 1923, Canada turned back 13,000 United States citizens as undesirables from her standpoint. What do you think of that? Why we turned back only about 40,000 Europeans in ten years' time prior to 1920, but we are doing better, in both rejections and deportations, now.

"Those who talk about distribution and supervision of immigrants seem to forget that the first restriction we ever placed on immigration forbade the practice that now would be revived. That restriction is embodied in the old law forbidding the bringing in of immigrants under labor contracts. Almost any person on the shadow side of middle life will recall the wretched state of affairs which brought that law about.

"Similar abhorrent conditions would arise if we repealed the law. Our own workmen would have to compete with serfs or peons or 'bound out' aliens. Nobody can advocate that.

"And I can imagine no way by which these temporary immigrants might be sent back to Europe after we were through with them here. The Chinese who built the first western railroads were brought in with the understanding that they would return to China when their work was finished. But ninety per cent of them didn't go back.

"The proposal that we make all quotas net—that we let in others above the quota now allowed for those immigrants who return to Europe—also is without real merit. Aliens do not leave the country very freely when good jobs are plentiful. The ones who go back are those who take advantage of good times to sell their businesses or turn other property into cash on which to retire in their native countries. Thus we would be admitting poorer types to take the place, in the main, of better types. Besides, the steamship companies have trouble enough now trying to keep track of quota figures and the net proposition would mess up the figures badly.

"What unrestricted immigration from Europe, such as we had virtually until a few years ago, may mean to us is shown by a scientific study recently made and printed as a hearing of the House Immigration Committee.

Alien Defectives Cost Heavily

"WE FIND that the cost of alien defectives in the state institutions (not including county jails and poorhouses) averages three and one-half per cent of all the money raised by all the states from taxation. States with many aliens, of course, pay the most.

"New York State, with about ten per cent of the white population of the country and twenty-two per cent of the foreign-born, has seventeen per cent of the institutional insane and more than thirty per cent of the foreign-born insane. Of its 43,000 asylum inmates, forty-six per cent are foreign-born, sixty-eight per cent are of foreign-born parentage and seventy-two per cent are children of one or both foreign-born parents. These cost the New York taxpayer more than thirty per cent of all money paid to the state. New York's state insane asylums are overcrowded by 13,000. Governor Smith has called for a bond issue of $50,000,000 to provide additional facilities.

"New York and all other states are sleeping on their rights. Deportation is the duty of Uncle Sam. These aliens are not citizens of the states, and they hardly can be called wards of the United States. They belong to the countries from which they came, and it is the duty of the states to force the Federal Government to send them back. Our laws so provide.

"Public opinion in America, even among the bulk of the foreign-born, will never again tolerate our going back to anything like the old open-door and fallacious 'melting pot' rule that governed our immigration policy prior to the enactment of the three per cent law in 1921.

Mr. Johnson's Solution

"IN MY opinion we should lower the percentage and make some certain provision for the immediate relatives of those already here, when otherwise acceptable, being given preference. Whatever processes of selection are exercised should be applied as far as possible at the source. I think the basis for quota allotments should be the foreign-born population shown by the census of 1890, and not that of 1910, as at present. In defense of this latter statement, I won't go into the matter of races—if we are going to have wholesale immigration it might as well be made up of one people as another. But the purpose of their coming has much to do with it. Our immigration up to 1890 was propelled in the main by sincere desire on the part of those who came to share the benefits coming from our institutions, and to help later to build our new government. They didn't come—as our forefathers who founded the nation didn't come—merely because labor was in demand. They didn't come expecting to find the new country ready-made for them.

"That is to say, we must keep away from every pocketbook angle of the immigration problem.

"I believe this view will govern whatever further action Congress takes in the matter.

"I believe at the next session of Congress a bill reducing the allowable quota of immigrants from any European country to two per cent of that country's natives shown to have been resident here in 1890, and allowing an additional one per cent for relatives, will be reported by the immigration committee.

"This, if such legislation is enacted, will cause the greater proportion of our new immigrants to come from Northwestern Europe. The rest of Europe will have smaller quotas but will offer more relatives—the point of contact being closer in their cases.

"During the first year of the new law, quotas were not used in full by many countries, and many immigrants went back. During the second year, ending June 30, nearly all the quotas have been used and few aliens have gone back.

"Immigration quotas opened July first. Immigration will boom for five months—with the North countries of Europe sending their full shares, for they know that the jobs and wages are here. In my opinion, this incoming stream will greatly slacken the labor shortage, but it will not end the demand for cheap labor.

"Those who demand the admission of more and more alien laborers, forget the dependents, refugees and others who are bound to come if we weaken. Even those who need labor must see that the immediate gain is not worth the future cost."

To Revive Pony Express to Honor Mark Twain

Riders Will Bring Back Western Days of Old When They Gallop the Trails Made Famous by Buffalo Bill and His Pals

MRS. F. F. GUNDRUM,

Regent of the Sacramento branch of the Daughters of the American Revolution, presenting the tablet commemorating the Pony Express to the capital city of California.

THE storied trails of the West, from the Mississippi River to the Pacific Ocean, are to ring once more with the hoofbeats of the mounts of a band of men who in their day were as famous as the Northwest Mounted Police, the Texas Rangers, or the Mexican Rurales have since become. The Pony Express, which once raced over these trails, through dangers of thirst and storm and hostile Indians, is to be revived in the autumn of 1923 in honor of Mark Twain, whom the West considers its greatest writer and by no means its least historian.

Delegations from California, Nevada, Colorado, Utah, Kansas and Missouri—through which the route of the Pony Express passed nearly seventy-five years ago—met in Denver to arrange the details of the celebration, which is to culminate in the placing, on the old Comstock Lode, in Nevada, of a heroic bronze statue of Mark Twain, the clay model for which has been made by Roger Noble Burnham, of Berkeley, California. The idea of the revival of the Pony Express originated in Nevada, where former Governor Emmet L. Boyle headed a committee which first proposed to hold a Pony Express race from Reno to San Francisco, during the Comstock celebration in the Sagebrush State, and the annual Admission Day fête in the city beside the Golden Gate. The celebration will open in St. Joseph, Missouri, August 28, and end in San Francisco September 9.

This idea took hold on the West, and was expanded into the present plan of a revival of the Pony Express for one run from St. Joseph, Missouri, the eastern terminus of the famous "nine-day mail," to San Francisco on the west. States, counties, cities, towns and villages along the route through Powder River Canyon, along the banks of the Sweetwater, past Fort Laramie and the old plains outpost; Fort Bridger, whose guns, though silent for decades, will boom again in honor of the imitators of the riders they once saluted; through the lands of the Cherokee and the Sioux and the Piute—all will pay tribute once more to the Pony Express.

Along the route of the Express, which will follow closely the old trails, plans are being laid to erect statues of Mark Twain, Bret Harte and other men who either made or wrote the history of the West, and paved the way for the settlers to congregate in the cities which now dot mountain and valley from the Mississippi through to the Sunset Sea. The historic spot from which the first Pony Express rider started eastward on the morning of April 4, 1860, was marked in March by a bronze plate, the gift of the Daughters of the American Revolution. The place is now a grocery store, but it is the same building in which, sixty-three years ago, the "Alta Telegraph" had its headquarters in Sacramento, California, and from it the nine-day service to the Mississippi, which developed into more than a nine-day wonder, was started. This building will be the Sacramento stopping place of the revived Pony Express of 1923, but the messages from St. Joseph will be carried on into San Francisco, and others will be started back from San Francisco, via Sacramento, for the Missouri city.

The monument to the Pony Express in St. Joseph, Missouri, at the time of its unveiling by the Daughters of the American Revolution, in 1912. Standing at the left of the monument is Charles E. Cliff, who was a rider out of St. Joseph in the sixties, and, at the right, Col. Wm. F. Cody (Buffalo Bill) who made one of the longest rides on record while in the service of the Pony Express Company.

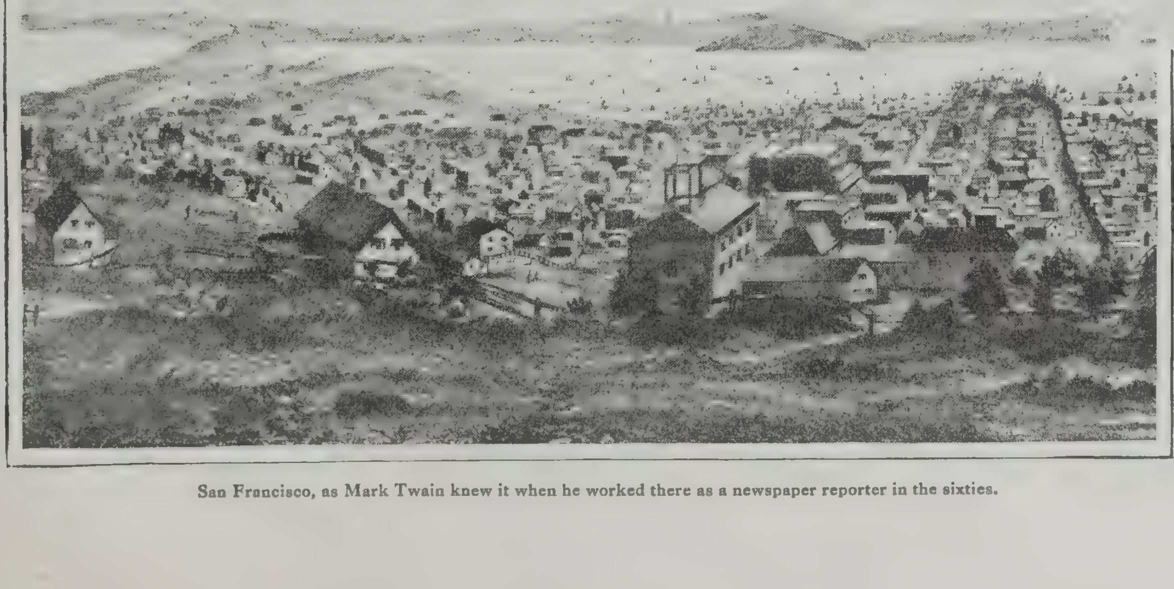
The Pony Express of the old days took off, westbound, where the telegraph lines stopped at St. Joseph, and linked the Far West with the wires and the mails in that place. It continued for some years, until a telegraph wire was strung from St. Joseph to Salt Lake City, and, thereafter, the old California Telegraph Company extended it to San Francisco. There were approximately 200 riders in the employ of the old Pony Express Company, and their weight was limited to 120 pounds each, while the mail pouches likewise were limited to twenty pounds, so that all communications had to be written on tissue paper, the charge from San Francisco to St. Joseph being ten dollars, gold, an ounce or fraction thereof, or 500 times the present charge for a letter weighing one ounce, over the same or greater distance.

Clay model of proposed statue of Mark Twain, by Roger Noble Burnham, of Berkeley, California, to be cast in bronze of heroic size and erected on the Comstock Lode, Nevada.

The horses used by the Pony Express riders were California mustangs, the result of the crossing of Arabian stallions, imported by the Spanish conquerors of Mexico and California, with the smaller mares owned by the Indians. Light weight and speed were essential, with endurance a third qualification, which, lacking, soon put man or horse out of the service. The first mail carried fifty-six letters from San Francisco, thirteen from Sacramento and one from Placerville. All reached St. Joseph within the stipulated nine days, and the California mining camps literally "went wild" when the first eastern mail, from home and loved ones, "only nine days old," reached the roaring placers. The first letter express, widely advertised in all the newspapers of Northern California, left San Francisco April 3 by boat across San Francisco Bay and up the Sacramento River to Sacramento, and at 2:45 a. m. April 4, Sam Hamilton, riding a small "pinto" mustang, tore out what is now J street, from the office of the "Alta Telegraph" bound to Sportsman's Hall, twelve miles beyond the present city of Placerville, then known as "Hangtown." He was on time, and as he dashed up to the Hall, Warren Upson, mounted and riding out to meet him, snatched the leather pouch from Hamilton's hand, and was on his way at a top gallop over the summit of the Sierra Nevadas to Carson City, Nevada. There another rider, meeting the mail at full speed, again snatched the bag and dashed away through fair weather or storms, night and day, with the precious first mail for the East.

The return mail was even more the occasion of a celebration than that which left California eastbound, for that rider brought messages from home and loved

(*Concluded on page 15*)



San Francisco, as Mark Twain knew it when he worked there as a newspaper reporter in the sixties.

A Great Editor and Discoverer of Genius

William Robertson Nicoll, Editor of *British Weekly*, Internationally Known

By ARTHUR G. WALKER

WILLIAM ROBERTSON NICOLL, editor of the *British Weekly*, was an international character for thirty years or more. His editorial range was probably never exceeded, and his knowledge of literature was perhaps only surpassed by Mr. Saintsbury. His leading articles, numerous books, public activities and private character left no room for doubt as to the depth and richness of his spirit.

He was born October 10, 1851, at Lumsden, Aberdeenshire, Scotland, his father being a native of the town and at the time of his son's birth minister of the local Free Church. The son's passion for books was kindled in the famous library of his father. This remarkable man, with a salary that never went beyond $1,000 a year, collected into that humble manse more than 17,000 volumes. The mother, a bright, warm-hearted girl and true helpmate, died early of tuberculosis, leaving four little children. William must have inherited a tendency to this weakness, for later it threatened his life, and was the turning point in his career. Throughout his life he had the struggle of a tireless spirit laboring in a frail body.

The Free Church manse at Lumsden was a small two-story house, very plainly furnished, and the house boasted little in the way of carpets. Books were the chief adornment. The atmosphere was intellectual. The children acquired a love of literature. *"Our Village,"* wrote Nicoll, under his pen name, Claudius Clear, *"contained, when I was a child, about five hundred people and eleven thousand books."*

His father had a horror of poverty and judged his own lot ideal. He coveted nothing for his children but that they should enjoy a life like his.

The summer days were full of happiness for the little ones. In the roaring nights of winter they made happiness for each other. Winter in Scotland meant the snow piled for weeks on hill and field, with a leaden-colored sky that refused to let through a single gleam of sunshine. From his own pen we have a delightful little picture of himself and his father reading "The Virginians" on winter nights. "Thackeray's great work was issued in three volumes and father had procured it from a circulating library in Aberdeen. We read it in a very stormy winter. My father sat on one side of the little table and I on the other, with the naptha lamp between us, each diligently scanning the page, while outside the strath lay locked in snow, and the winds were piling up the drift. At nine precisely each night we separated and went to bed, and seldom without a smile or a laugh. Truly we found 'The Virginians' a most tedious book."

Entering Aberdeen University, he took his M. A. degree at the early age of eighteen. The life of the Aberdeen student was emphatically a period of plain living and hard work. Two dollars a week sufficed to cover many a student's expenses for board and lodging and the summer was spent at home. He became the Free Church minister at Dufftown in 1874, going in 1877 to Kelso, the scene of the famous Horatio Bonar's ministry. Shadows began to gather at the beginning of 1885. His highly gifted brother, Mr. Henry J. Nicoll, died at the Kelso manse of tuberculosis at the age of twenty-seven. His sister Eliza, a young poetess of great promise, had died of the same malady. At the close of the summer, returning from a visit to Norway, he was seized with typhoid, which was followed by pneumonia. For several weeks his life was in great danger, and when a turn came for the better, it was clear to his physicians that his ministry at Kelso must cease, he must go to a milder climate and preaching must be given up indefinitely.

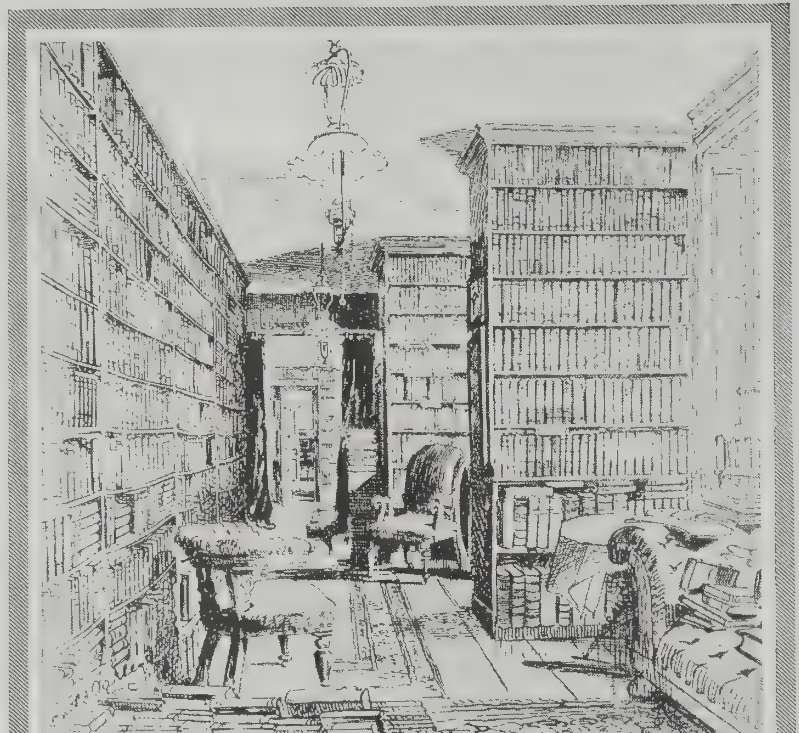
In this eclipse his courage did not fail him. In St. Bernard's Parish, Edinburgh, George Matheson, the blind preacher, was a living example of dauntless courage overcoming what at one time seemed an insuperable calamity. Complete blindness had fallen upon him at the very beginning of his work, yet he was minister of this important church and visitors crowded to his ministry. Nicoll knew how to draw inspiration from the lives of others, living or dead, and this fact was one of his secrets of strength and service throughout his life.

Literature was the likeliest way when he was able to take any way at all.

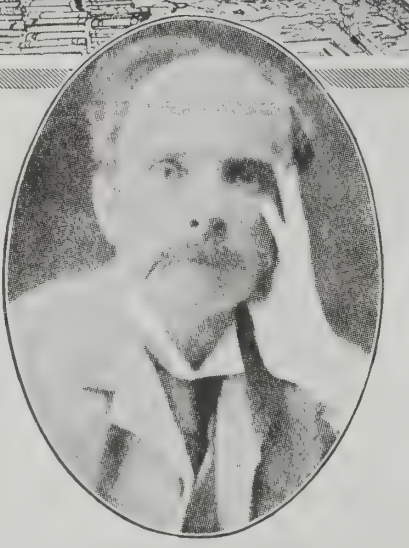
Before his illness he had become the editor of the *Expositor*, a monthly magazine published by Messrs. Hodder and Stoughton, London. Out of this relationship sprang the opportunity for founding a new weekly paper. In November, 1886, the *British Weekly a Journal of Social and Christian Progress*, saw the light. Then began one of the romances of journalism. Without any advertising, simply by one person spontaneously telling of its merits to another, the fame of the weekly spread and its circulation grew by leaps and bounds.

Much might be said of his colossal labors in other editorial work; of the *Bookman*; the *Woman at Home*; and whole libraries of books, but the *British Weekly* was beyond dispute his great creation. It was he himself in print. It struck an open road, hit the thoughtful mind at a point clear of age-long prejudice and bigotry. It rang so true that its appeal was the catholic appeal of truth. People of every type found in it real help. Whatever their seeming differences, they gathered with great good will round this center of inspiration and teaching. It was a point of contact and fellowship between people who seemed to have between them every other barrier. The rich and the poor, the learned, and those of little learning, alike looked eagerly every week for the day of its arrival.

In saying these things I speak from knowledge. He opened the way into literature for thousands who otherwise would never have struck the track. There were youths on farms and in mines whose schooling was very slim, but they had curiosity and the *British Weekly* gave them both direction and encouragement. Some years ago I dropped into the cottage of a young miner who under Nicoll's influence had collected a very choice library of more than a thousand volumes and, though working in the mine, was attending classes at a neighboring university.



From a drawing by Harold Oakley
Sir W. Robertson Nicoll's library at Hampstead.



SIR W. ROBERTSON NICOLL.

From a photograph taken some years ago.

It is difficult to say whether Nicoll was greater as a bookman or a journalist, but he was beyond doubt one of the greatest, considered either way. Mr. Clement Shorter, an intimate of many years, says that at one period Nicoll was writing in one paper on literature, in another paper on the work of the churches, while at the time editing no fewer than five publications weekly and monthly. His industry and determination were amazing. During an influenza epidemic when the students in Professor Marcus Dods' classes were nervous and ready to surrender to slight indispositions he would rally them by saying, "Think of Nicoll sitting up in bed to dictate a leader with his temperature at 102."

He was an omnivorous reader of books and newspapers. Sir J. M. Barrie says that during the six weeks they were together in America one of his tasks daily was to dig him out of white mountains of newspapers. On a journey between London and Scotland he would read five or six new books. His regular allowance was two a day. He really read them and with a fabulous memory remembered all he read, so that at almost any distance of time he could recall every important detail. He was always collecting books. If he had leisure in any city he might be found with certainty in a bookstore. It is said that on these journeys one of the chief tasks of his valet was to keep a keen eye on his master's clothes. As he collected books he would thrust out first one piece of clothing and then another, so that if he had been left to himself he would have arrived home with what he had on his back. Having such a frail body he found it congenial to spend a day in bed rather often. Intimate friends were allowed the usual liberty of visiting him. There he would be found with all kinds of newspapers piled on the bed, intermixed with a few score of books.

For more than thirty years he lived in a large rambling house, Bay Tree Lodge, Frognal, Hampstead. He found pleasure in the summertime in the big old-fashioned garden, but his real and never-failing delight was his library. The room more than fifty feet long he had modeled somewhat on the plan of Mr. Gladstone's library at Hawarden. The plan was to economize space and make every volume easily accessible. In this place, on the shelves and on the floor, he had packed over thirty thousand volumes. At the far end, as far away from the door as he could get, was the large open fireplace and his low easy chair. New books were always arriving by hundreds and these had to be content with a place on the floor until they could be taken care of.

It is said that a constant regret was that it was necessary to use two eyes in the reading of one book. Once settled down he would soon be talking of books, and if you were interested in books you were in for a great time. He was very devoted to biography and would indicate by a slight backward throw of the head their location, saying something like this: "There are five thousand of them behind my chair and I know where to find every quotation in them." He was a brilliant conversationalist. In his early days he was said to have been an impassioned public speaker. It is fifteen years since I attended a large international conference one morning when he and Dr. John H. Jowett were the speakers. It was a great morning.

One of the incalculable debts the world owes to Nicoll is the large number of the men and women of genius he discovered, or greatly assisted. When one thinks of the physical frailty of Nicoll one also thinks of Sir James Barrie; in this they had much in common, though the latter had undoubtedly the advantage. Barrie was pushed into the eye of the public by Nicoll. He had his city office then at the top of Number 7 Paternoster Row. J. M. Barrie, with his characteristic quizzicalness, tells how, on the eve of his interview with the awesome editor, he bought out of his poverty a top-hat in the hope of making a favorable impression. It was on July 1, 1887, that the *British Weekly* introduced its readers to this enchanter. How I remember the enthusiasm in our home and the impatience with which we anticipated the next issue. The crowd looking through "The Window in Thrums" grew at a great rate, but we all found some little point through which we could get a glint of our neighbors. How much do we owe to the man who gave the world this magician of words! A sensitive spirit like his might have been smothered under the choking fog of neglect. The cocksure and glib-tongued who say "a good man cannot be kept down" have another thought due, and one much truer. The great have destroyed more of the gifts of heaven than they have gathered.

The present generation may scarcely know "The Lilac Sunbonnet" and its author, S. R. Crockett. He died all too young, but through the columns of the *British Weekly* he gave delight to thousands. Few modern writers can give more real zest and happiness on a vacation than one of Crockett's revelries round "Glesca" and among the moorlands and heather beyond.

Nicoll's ability to make folks write was scarcely less than his ability to discern that they had writing ability. Coulson Kernahan, Jane Stoddart, David Lyall, Ian Maclaren, and a host of others, have given good things to the souls of the wayfarers, the loss of which would have made life very much poorer. One of Maclaren's sons said to a visitor, "You come back here in a month or two and dad will retell you your own stories, but you will never recognize them." Maclaren, whose real name was John Watson and who was also a Presbyterian minister, was a born story-teller. He used to say, "Stories were like taking over an old house; they needed fixing up. They needed a room thrusting out here, a window there, a door there; and quite often it was needful to put in a new sewer." But it was Nicoll who insisted that he could *write* a story. Whatever else he did that was good, and he did much that was good, under his own name of John Watson, he will live perhaps as long as Scotland is Scotland as "Ian Maclaren," the writer of "Beside the Bonny Brier Bush." I can reread it and laugh and cry over it with as much reality as when I feverishly waited from Thursday to Thursday for the next chapter in the *British Weekly*.

This is written by one who is a lifelong debtor to Robertson Nicoll and his men and women. Life would have been a very different and much poorer thing without them.

He joined the immortals on May 4, 1923. He was a great believer in immortality. If mortals may ever be said to deserve immortality, he deserved it. When some fellow-toiler dropped from his task into the unseen, he would with deep feeling observe, "It is a well-earned grave he has got himself." Such words are true, especially, wonderfully true of William Robertson Nicoll.

From Counter to Counter of Bargain Bookshops

Concluded from page 3

in thousand-dollar volumes; they help along the needy student by selling him or her this year's course books and making a very good allowance on them for next year's advanced books. Because the old book does not suffer progressive depreciation after it has been labeled at its lowest price, one is welcome to buy any such book, use it from three to ten days, and resell it at virtually no loss whatsoever.

The bookseller at these shops will agree to almost any sort of bargain. His motto is to keep his books moving. There is more than one—not only one—customer for every book he sells; that is why he is glad to buy it back.

Schulte's—the largest of all—has half a million books, not a few of them new, but all are sold as used books, at used-book prices. The reduction is either a discount from the publishers' prices or an arbitrary low figure. Such a stock, with its necessarily limited number of duplicates, is a big stock, and yet Mr. Pesky, its manager, thought nothing of buying 20,000 books from the Navy—a United States Government sale. A hasty selective process, an advertisement, festoons of paper emergency announcements, and the occasional passers-by soon gobbled up these ex-ship libraries.

The Bargain Bookshops are many. They cluster about the neighborhood, and book lovers play no favorites. They amble from one counter to another; they will visit next time the counter they had to forego today. A few enterprising ones have moved uptown, in the east Fifties, but the trade is yet "sot" in the Wanamaker vicinage. Fifteen-thousand-dollar rents and ten-cent secondhand books are as yet too divergent. And the unwritten law of the old book sale is to keep prices down; to reduce, but never to increase.

This is proved by the ease with which books which fail to move—and that is inevitable of any article in business—quickly enough are marked down, in progressive stages, to be sure, but it is not rare that a book originally marked a dollar is priced half, then thirty-five cents, then twenty-five cents, then fifteen cents, then ten cents and if necessary a nickel. This does not happen very often, but it happens. And human nature is always the same; hardly any purchaser seeing a book with its original one dollar mark visible will fail to be interested at five or ten cents on the dollar.

That is what magnetizes the passer-by and attracts him to the bargain tables. The magic of the ten-cent or twenty-five-cent counter is indisputable. It is like the five-and-ten-cent store, only more subtle. What if a cover is torn off, or the fly leaves mutilated? A man paid fifteen cents for a book in very bad order which contained a quotation that he forthwith cut out with a penknife and stored away in his cardcase. He was a middle-aged man. A whole life's history may have been compressed in that fugitive tabloid incident.

The Bowery, the ancient and picturesque thoroughfare, is only two or three blocks away, and at that point begin the numerous "hotels" with their peculiar cabin-like "rooms" rented out nightly from ten cents to twenty-five cents. These lodgings are well patronized, and not by the hoboes either, of which there are very few nowadays, and it is strange how many of these lodgers like to browse around the tables of the secondhand bookshops!

Farther uptown the five-million-dollar hotel houses the collector who has just arrived from England, where his purchases, mainly made at Sotheby's, exceeded a million dollars, and the bulk of the books hardly would overflow an ordinary box trunk, but does he think any more tenderly of his rarities than the man, perhaps an old salt resting a few days, his money in the famous Seamans Savings Bank, who inserts a stubby and careful thumb in a book of poetry. I have seen such a man study the cerulean cover, little the worse for age and handling, read a couple of sonnets, and then make his purchase. Euterpe and Polyhymnia were two Muses which would have a worshiper.

In another shop there is a postman who makes regular selections of books, books that are serious, practical, instructive, useful, the very corner stones of any library. He pays so much every payday. One gathers the impression that if a dollar is needed toward a new shirt or another book he won't flip a coin to decide; the bookman will get the money.

The characters are no fewer than the men and women who patronize these shops, whether by design or chance. The important fact about this secondhand book business is that the buyers buy to read. It is not a spurious knowledge or an upstart erudition that is being pampered. It would be impossible to estimate—but there can be no doubt that these seekers after inexpensive knowledge will be heard from in later days. When we remember, as the lives of many of our famous characters are studied, how nearly all depended upon the borrowed book or the tome purchased at a sacrifice, one may admit that in these days of relative opulence and easily gratified knowledge the secondhand bookshop is no longer a commercial incident but a national institution.

The New York old-book shops are the very picture of bookshops elsewhere in the United States and abroad. Has any one ever seen such a shop without at least one visitor about?

In a city of many millions like this the specific number that idles through these friendly bookstalls is not great; in fact, it is infinitesimal; but as a hundred wasters cannot undo the work of one constructor, one can easily overlook the gilded and vapid clientele which flocks into the fashionable or notorious districts.

These are noted for their electric current; but the book browsers are the ones who burn the midnight oil —and will any reader be surprised if I say that the number of oil-lighted rooms in this city is yet very great?

Oh, Yes! Pure Food Law? Well, What About It?

Another One of Those Great Reforms That the People Soon Forget About

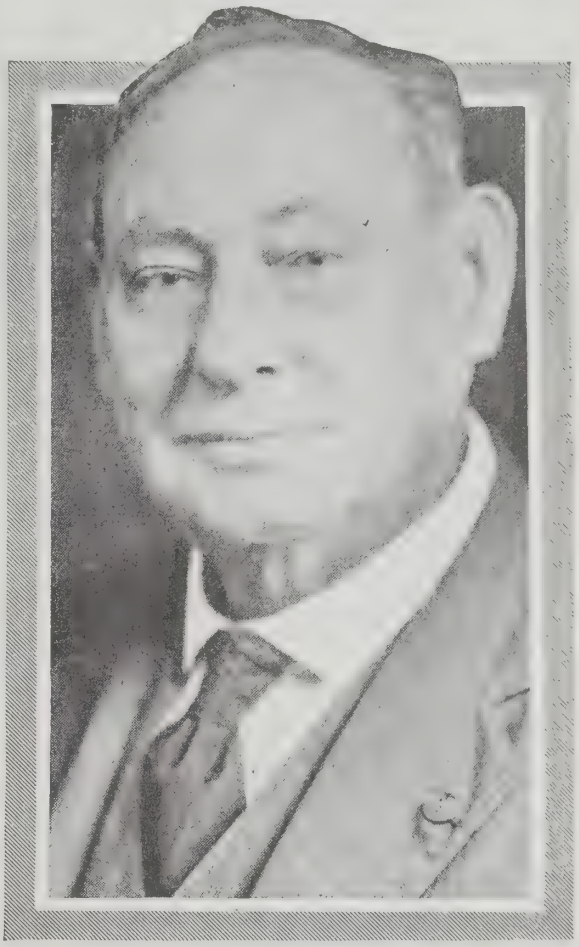
By DR. HARVEY W. WILEY

Have you heard anything about pure food lately? Of course not. We Americans are satisfied with the shouting of protests and the promises of reform. We have no "follow up" system. None of the great progressive slogans of the past fifteen years have gone beyond the slogan stage.

Promises were made, new jobs created, and there it ended. In this able article Dr. Wiley tells how the great protest against impure food has gone for nothing. The people confidently turn the supposedly settled matter over to their hired officials, and then the officials do as the "interests" desire. The people have no "follow up" system. This article is in the nature of a "follow up."

THE principal points in which the good effects expected from the Food and Drugs Act have been missed, are as follows:

First: The endorsement of the use of benzoate of soda in foods. This endorsement came about by President Roosevelt ordering the Secretary of Agriculture to appoint a board of consulting scientific experts, whose opinions were to take precedence of the decisions of the Bureau of Chemistry. This body was commonly known as the Remsen Board because Dr. Remsen, of the Johns Hopkins University, was its president. This board reviewed the work done by the Bureau of Chemistry on benzoate of soda and reversed all the decisions which the Bureau of Chemistry had arrived at in regard to the harmfulness of this article. As a result of their findings, a Food Inspection Decision was published, permitting and justifying the use of benzoate of soda in food products. Fortunately, the public had been so educated in regard to the harmfulness of a preservative of this kind that none of the high-grade manufacturers have ever taken advantage of this indulgence. It is a rare thing at the present time to find benzoate of soda in catsup. The only place where it is likely to be found generally is in cider. The Prohibition commissioner suggests benzoate of soda as one of the means of keeping apple juice sweet. He forgets, or probably never knew, that benzoate of soda is far more injurious to the health of the drinker than the amount of alcohol which would naturally be developed in cider if left to itself would cause. So long as benzoate of soda is permitted as a preservative in cider, it will be a menace to the public health whenever drunk. The catsup which is now made is very much better than the old-fashioned catsup which was preserved by benzoate of soda. Public opinion has practically put the use of benzoate of soda out of commission, and I hope the Prohibition commissioner will some day see the error of his decision and require that cider which is to be preserved without fermentation should be sterilized, just as grape juice is today.



DR. HARVEY W. WILEY

For many years chief of the Bureau of Chemistry, United States Agricultural Department. Dr. Wiley is now conducting the Bureau of Foods, Sanitation and Health for *Good Housekeeping*.

Second: When the Remsen Board was appointed, the results of the experiments of the Bureau of Chemistry with sulphur dioxide in food products, which showed that this article was injurious to health, were countermanded, and the manufacturers of sirups and other food bodies, such as dried apples and peaches, were permitted to use as much sulphur dioxide as they cared to. The Remsen Board wrestled many years with the question of sulphur dioxide and spent tens of thousands of dollars appropriated for execution of the food law, but failed to come to any unanimous decision. Meanwhile, the order permitting the use of sulphur dioxide in food products has remained unchanged and it is, therefore, commonly found now in all molasses made in the United States, and in nearly all dried fruits, a continual menace to the health and prosperity of our citizens.

Third: The Remsen Board also investigated the relative unwholesomeness of alum baking powders as compared to baking powders made with tartrates and phosphates. They came to the curious decision that alum baking powders were no more unwholesome than tartrate and phosphate powders. This was damning alum with faint praise, as the only logical conclusion is that the Remsen Board found all baking powders unwholesome. One of the most impossible deductions was made by the board from this, namely, that as alum baking powders were no more unwholesome than other baking powders, therefore, alum might be used in food products, especially in pickles. Fortunately, public sentiment which believes that alum is what it is well known to be, a poisonous substance, has not permitted a very wide extension of this indulgence. It is interesting, however, to see to what length debasement of the Food Law has been brought by executive interference with the law itself.

Fourth: Under the food law the government won its suit against bleached flour and coca cola. In spite of this victory, however, no attempt has been made by the officials executing the law to restrict interstate commerce either in coca cola or in bleached flour. Such restrictions as do exist are found only in the state laws. A few states forbid the manufacture or sale of bleached flour within their limits, but I believe no state has passed any legislation against coca cola. These two threats to the pocketbook and health of our people, and especially of our children, still are under no executive restriction although under the act itself both have been condemned as injurious to health and as being misbranded.

Other ways in which the administration of the food law has been weakened are found in the changes in the standards, especially in dairy products. The standard for evaporated milk has been reduced from twenty-eight per cent of total solids to twenty-five and one-half per cent, whereas the standards for evaporated milk in England require thirty-one per cent of total solids. The standard for butter fat which required eighty-two and five-tenths per cent of butter fat in butter and not more than sixteen per cent of water has been changed by act of Congress in eliminating all reference to water and fixing the standard of butter fat at eighty per cent. Full advantage will be taken of this act of Congress. It is evident that hereafter the maximum content of butter fat will not exceed eighty per cent. Before the enactment of the law, the average content of butter fat was eighty-five per cent. Congress passed a law which has never yet been repealed, limiting the amount of water in butter to twelve per cent. By selling five pounds more of materials that are not butter fat to the consumers of this country, the additional charge for our butter bill will be about $40,000,000 a year. It is unfortunate that not only have the officials who have charge of the enforcement of the act failed to function under the old slogan of deciding every doubtful point in favor of the consumer, but have placed themselves under the banner of deciding every debated point in favor of the manufacturer. Congress has now fallen into the same category, and the last act on standards of butter was taken solely in the interests of those who manufacture butter and not in the interest of the great American people, every one of whom is a consumer.

Music Wins Passport From Bela Kun's Wife

Hungarian Noblewoman Tells of Her Trials in Fleeing Red Regime

By MARGITA DE REGECZY

The writer of these articles on Bolshevism is a Hungarian noblewoman who passed through the Bela Kun Revolution in her country.

THE Bolsheviki in their earnest desire to organize a free and happy state next abolished the tiresome, old-fashioned marriage law. They found it perfectly sufficient for human happiness that the couples should take a little walk to the nearest Red Guard station and announce their intention of living together. Divorce was made quite as easy and a mutual understanding between the parties was not even necessary. Why put superfluous obstacles in lovers' ways? One could divorce one's husband or wife without the other party knowing it and marry again.

The state promised to take care of the children. They did not explain how they meant to proceed, they only encouraged the people by proclamations posted in big letters on the streets and beginning with: "No more illegitimate children."

One day coming home in broad sunlight I was again followed for a short distance. This time it was a Red Guard, who finally walked up to me and handed me a printed circular with a significant smile:

"Bring this home my pretty young Citoyenne and study it."

I took the circular home and studied it to be sure. It stated that women were "common property" also and that every man had the right to choose for himself the women he liked.

I did not hand over the circular to my mother, but on the same day the maid also received one on the street. She thought it a good joke and showed it to everyone at home very much amused by the contents.

This was the end of my mother's peace of mind. In the evening she came to my bedroom, her sweet face looking pale and sad.

"It is hard for a mother to tell her daughter, 'leave home and go out alone in the world'; however. I will not have a single moment's rest as long as you are in this lawless country," she told me earnestly. "Cousin Ivan succeeded in escaping to Vienna months ago and he writes me that he is waiting for you. Try to secure a passport and go to peaceful Holland where we have the best friends. I have foreign money enough to keep you for a year or longer, so I will not have to worry about your finances for a time. Besides this you have the advantage of having traveled a great deal and of speaking four languages fluently. I am quite convinced that you can make your living after you settle down somewhere."

Entertains the Bela Kuns

I WAS ready to follow this plan at once. I had been used to an active, interesting life, spent in studies and travels, and the last months spent under the Bolsheviki tyranny had weighed more heavily upon me than I had ever expressed to my mother. Not a moment was I afraid of the thought of standing alone, left on my own resources. I had studied music since my childhood quite like a professional and had played before the court and at numerous big concerts.

I had numbers of excellent press notices from different countries. The next day I selected some of them and sent them to a concert bureau in Holland asking for an engagement. The answer was not delayed long. The manager wrote and requested me to appear at one of the big concerts at Scheweningen. Now I had a motive for asking a passport. I was not a noblewoman wanting to fly from the Bolsheviki, but an artist desiring to fulfill an engagement.

So I set out on my quest for a passport. Days passed in a fruitless running from office to office. The Bolsheviki accorded no such documents and the only answer I received was:

"Bela Kun ordered not to issue any passports. The nobility should remain at home and suffer; they had a good time long enough. The Proletarians are the masters now."

"But I am an artist and I must follow my engagement to Holland," I persisted and noticed that a tall man standing in the office was looking at me fixedly. When I left the place the man followed me and stopped me in the hall, handing his card with a deep bow.

"I am Doctor D.," he introduced himself, "I know your family and I know also that you play the piano beautifully. Perhaps I can help you with the passport."

Walking at my side the physician informed me that his wife had gone to school with Bela Kun's wife in her girlhood. Now that the Bolsheviki chief had come into power, Mrs. D. had renewed the acquaintance, hoping to avoid many a danger and inconvenience as friend of Mrs. Bela Kun. She had calculated well: for no Proletarians had been quartered into their apartment, thanks to the dictator's wife.

"We could arrange a musical party," the doctor suggested. "Mrs. Bela Kun is crazy about music and plays the piano a little herself. Ask your mother to let you come to us and gain a passport from Mrs. Kun."

My heart jumped high at this quite unexpected prospect. I did not lack confidence in myself and felt sure at once that I would have success if I could speak to the person upon whom it depended. The wife of the ill-famed Bolsheviki leader was young still and it was due to her influence that the morals in Bolshevistic Hungary did not sink quite as low as in Russia and that the Reds were not left quite as free to commit their misdeeds.

Will they come to the party? I asked myself. The Bolsheviki chief protected his precious life more carefully than any monarch. Everywhere he went in his closed motor car, he was accompanied by his bodyguard. The Grand Hotel Hungaria where he lived with his family had been seized entirely for the use of the Bolsheviki chiefs. Everybody knew that even during the few steps from the car to the door of the hotel his five Red Guards surrounded Bela Kun protecting him with their bodies in case anything should happen.

As I arrived at the doctor's house I found four or five people waiting there. Among them was a young man who had a beautiful voice and was to sing. The doctor's wife whom I saw for the first time told me how she had gone to school with Mrs. Kun, who married, when very young, Bela Kun, the editor of a small Socialist newspaper. At the beginning of the war he was enlisted in the army and soon afterward surrendered himself to the Russian. He was taken as war prisoner to Moscow and witnessed the outbreak of the Bolshevistic revolution in Russia. He became friend and helper to the notorious Lenin, came to Budapest after the war with large sums of money and organized the revolution in Hungary.

While we were talking two closed motor cars stopped before the house. About half a dozen Red Guards got out and surrounded Bela Kun, his wife and another Bolsheviki chief of the name of Lukacs. The soldiers remained in the hall and the three "illustrious guests" stepped into the parlor.

I had seen numbers of Bela Kun's photos, yet I had never imagined him to be as repulsive as he appeared to me now. A short man with extremely protruding lips, prominent eyes, very long arms, and a few bristles adorning his head. His personal atmosphere made me feel uncomfortable and I remained motionless, until I was introduced to Mrs. Kun who looked at me with keen interest.

"This is the young Citoyenne who plays the piano so well and who has an engagement in Holland," the doctor's wife explained to the dictator's wife.

I saw a nice young face with melancholy eyes, serious and sympathetic. Mrs. Kun gave the impression of being a very plain little country woman, in spite of her smart up-to-date clothes. She had heavy, red hands that could not acquire a refined appearance so quickly after her husband got to be head of the government.

The company sat down and all eyes were fixed on Bela Kun. The Bolsheviki chief and Soviet commissioner Lukacs discussed the problem how to crush the "damned Bourgeoisie" entirely and establish the rule of the Communists over the whole world. He gesticulated violently as he spoke and his eyes rolled savagely in his head.

A few moments later I sat down to the piano and as I played Mrs. Bela Kun looked at me fixedly all the time.

"How happy you should be that you can play like this," she said at the end. "It was my greatest wish to study music, but I could never afford good masters. You certainly have employed your time and your money well and now that you have lost your fortune you are able to teach and to play at concerts."

"I mean to do it with pleasure," I answered, and handing the Dutch invitation to her I added in a low voice: "Mrs. Kun, won't you help me get a passport to accept this engagement?"

Promises Passport Aid

WE WERE sitting on a sofa in a corner of the room and the doctor entertained Bela Kun, so that I might talk to his wife undisturbed. Mrs. Kun read the letter attentively.

"Scheweningen, The Hague—how lovely," she sighed, "and will you leave this country forever? Conditions here will not be so bad later on for those who are willing to work. Only the idle, pleasure-hunting class shall be and deserves to be exterminated. You are not of this kind. You must have worked and studied hard to know all you know."

"I will not leave this country forever, as my dear mother remains here," I replied, lowering my eyes, "but at present I would like to play at these concerts in Holland."

The tyrant's wife kept thinking.

"I will telephone to the passport office myself tomorrow, that they must give you the passport. And you send me a postal card after your first concert in Holland."

I did not say "yes," but I said "thank you," and at Mrs. Kun's request rose to play again. As for Bela Kun, he never even looked at me straightly and kept his eyes continually turned in another direction. A short time later he expressed his intention of leaving the company, saying that his wife and friend could remain an hour longer. Followed by his Red Guards he left the house in one of the closed cars, without having spoken a single personal word with me.

Everybody seemed to feel more at ease after his departure. My sense of humor asserted itself and I walked up to the other Bolsheviki chief who was looking out of the window.

"That is a lovely car you have, Citoyen," I accosted him, "you surely did not buy it; that would have been too old-fashioned and Bourgeois-like. To whom did it belong before you seized it?"

The Bolsheviki took the joke and replied:

"It belonged to Prime Minister Count Stephen Tisza. He had three cars and we seized them all. This one was the best, so we use it for ourselves. It is a very fine car, just wait till you try it, you audacious young lady."

"We shall take this young artist home in it," added Mrs. Kun to complete the humor of the situation.

"I am afraid my mother will think it too great an honor," I protested, seeing that I could risk to be sarcastic. But Mrs. Kun did not let me off and a quarter of an hour later I was packed up at her side in the murdered prime minister's automobile.

Bela Kun's wife and her friend were talking about some silk stockings that a secret Bolsheviki agent was to bring her from Vienna—the stores in Budapest having no more pretty things to sell. I sat silent, and thought of the great statesman to whom the car we drove in had belonged a while ago. Over 60 armed Bolsheviki had broken into the house of the famous Prime Minister Count Tisza. They shot him dead in his working room in the presence of his adoring wife and of a young niece, who received a bullet in her face. The scoundrel who had led the murderers and fired the first shot was at the time "Soviet Commissioner of War."

I asked to stop at the corner of the street where we lived.

"You will have the passport in a few days," said Mrs. Bela Kun as I jumped out of the car.

* * *

All preparations for the journey were made in great haste. The Bolsheviki traveling bureau permitted me to take a few personal effects only. No more money than 300 crowns were allowed to be taken out of the country. Exchanged in Austrian money this sum was sufficient to live for only a few days in Vienna.

When I had gone to the passport office they issued my passport without further parley.

Money Sewed Into Clothes

I HAD to pass a few more disagreeable moments before I procured a certain necessary stamp on my passport. I was advised by an employe of the traveling office to go for this purpose to the main building of the Red Guard, situated high on the hills of Buda. Armed Reds stood before the massive iron door and as this door opened before me, I saw a courtyard inclosed by the high building and filled with Reds. I hesitated for a few seconds, remembering the things I had heard about people who had been sent to Bolsheviki dens and who never came back again. However, there was nothing to be done. I entered the hall and saw with a pang the large door close behind me.

"Where have I to go with my passport?" I asked decidedly from a soldier sitting at a table, while some others grouped curiously around me. Without speaking he pointed at a dark stairway to the right. I thought I would not go further, but seeing that he had the telephone apparatus before him, I addressed him shortly:

"Give me the phone, I want to speak with Mrs. Bela Kun."

He made me a place without an answer and I called up the Hotel Hungaria very loudly, asked for the dictator's wife and screamed in the receiver so that all the Reds around me should hear it:

"Citoyenne Kun, I am much obliged to you for having procured me the passport. I am now at the main station of the Red Guard and will have my passport stamped."

Then I said to the man at the table:

"Please bring my passport up and have it stamped. Say that Mrs. Kun knows me."

He obeyed and came back two minutes later, informing me that there was no necessity for my being there. They had sent me to the wrong place. When the big door opened I was gladder to see the sunshine than I had ever been before.

I was full of energy and the difficulties of the journey before me did not discourage me in the least. We had some foreign money at home which was left over from our travels in foreign countries. It was this little fund consisting of 3,000 Swiss franks, 50 English pounds in gold and 200 Dutch florins, that I hoped would keep me free from cares for a time after I left my home.

I packed my most necessary clothes in a suitcase. My mother sewed the 3,000 franks in the hem of my traveling dress, the Dutch florins in my fur neckpiece and the English gold, which could not be hidden because of its weight, was put in my suitcase.

I felt my courage sinking as the time approached to leave my mother, God alone knew for how long a time. We stood in the station waiting for the train and I held her hand convulsively. Not a word left my lips as I was afraid of bursting into tears if I should speak.

"Do not worry about me," mother went on talking gently and firmly to me, "there is no danger for me. Write to me every week and behave well, so as to be a credit to your mother, to your nation. Live so that your life should be an inspiration to other girls fighting their way alone in a strange country."

I closed my eyes and remembered my pretty bedroom, my books, pictures and many nice little objects to which I had been used and nothing of which I could take along.

"I wish I had at least brought grandmother's emerald cross with me," I said.

"You have it," mother whispered. "I sewed it in

(Continued on page 14)

In New Brunswick, Land of Moose and Salmon

By JOHN T. FARIS, D. D.

This is the second of four articles by Dr. Faris. The third will appear in an early issue.

St. John, New Brunswick, was founded in 1783 and has now a population of about 60,000. It has a magnificent harbor with dock accommodation for the largest steamers afloat.

"YOU say you are off to Fredericton for that great steamer trip down the St. John River?" asked a young man, on the train from St. John. "Say, that's good; you can't beat that trip. But can't you postpone your ride for two days, and let me have the time? I'll take you in a canoe where the steamer does not go—far above Fredericton. We'll glide close under the trees that fringe the banks. We'll ascend some of the little streams that come in from the woods. If we have time we'll go up the Nashwaak as far as the falls. We'll camp on the shore. We'll fish, and we'll fry our own fish. Give me two days, can't you? I know the river like a book. My job is the running of a motor boat for a pulp mill. I'm about due to take a few days off, and I'd like to give it to you, that you may really see our river."

The Restigouche River flows through a heavily wooded portion of New Brunswick for over a hundred miles and empties itself into the Bay de Chaleur. It is one of the finest salmon and trout streams in the world.

New Brunswick has many noble streams, leading into the heart of the big timber, to which the hunter and the fisherman turn with longing, but the St. John is first. For nearly 500 miles the river loops up, then down, from its source in Northern Maine. Forest-born, it clings to its woods through most of its course. When the line between New Brunswick and Maine was defined by treaty, the river became the boundary for seventy miles. This boundary section is notable for many things, but most of all for Grand Falls, where the river, already broad, accommodates itself to a gorge several hundred feet wide. Into this gorge the water descends majestically, from a precipice sixty feet high, then rushes with abandon between rock walls that are, in places, as high as the stream is wide, while rapids and smaller falls frantically double the initial plunge.

In the course of its triumphal progress, the St. John—the Wool-as-took, or Long River, of the Indians—receives tribute from streams with names almost as enticing as they are themselves. Merely to read of the Madawaska, the Tobique, the Jemseg, the Washademoak, and the Oromocto, and to trace them on the map that is not a mere map for the man of imagination, is apt to be the beginning of a hunger that will not be satisfied without a plunge into the wilderness—perhaps a canoe trip up the Grand River and then, by portage, to the beginning of that famous salmon stream, the Restigouche, then down its one hundred and thirty miles of swift water to the Bay of Chaleur. Or he may choose to go, during half a dozen delightful days, up the Tobique to the lake from which it flows. From there, after a portage of only two or three miles, he may yield to the temptation to push on to the source of the Nepisiguit, close to Bald Mountain, New Brunswick's highest eminence, which is content with a record of twenty-five hundred feet. Then five days more, into Quebec, until he is stopped by the Grand Falls, where this salmon stream descends, in four stages, one hundred and forty feet to the incline toward the Bay of Chaleur—a course that is interrupted, thirteen miles farther on, by the Pabineau Rapids.

Woodstock-on-the-Meduxnekiag, Lower Canterbury-on-the-Sheogomoc, and Pokiok, the town that tells the visitor of the forty-foot fall and the picturesque gorge in the river from which the town takes its name, are landmarks in the middle section of the St. John, which, although not ordinarily navigable for steamers, are easily reached in the spring when the banks are full because of the melting snow and ice.

Then comes Fredericton, the quaint, beautiful capital of New Brunswick, where, in 1757, Acadians fleeing from Nova Scotia made their homes. The town was then known as St. Anne's Point. Across the river Fort Nashwaak had been built in 1692, as the seat of government for Acadia. It continued to be a stronghold of note until the troops were taken to the present site of St. John.

The old buildings of St. Anne have disappeared, but their place has been taken by relics of the days of 1785, when the name became Fredericton. The old barracks, the guardhouse and the officers' quarters form a group whose charm is enhanced by the elms that droop above them. On one gable of the soldiers' quarters a great sundial tells how the hours were marked for the men who long ago kept vigil there.

The modern parliament buildings and the exquisite little Christ Church Cathedral, a Gothic gem that deserves fame, are bowered in the majestic elms that grow in Fredericton in reckless profusion. Almost every street is an avenue between trees whose interweaving branches form a continuous arch of living glory. The old cemetery, where the people resort as to a park, gives the final touch of beauty to the little city that is the starting point for the descent of the St. John, on the comfortable little steamer that requires the entire day to reach Indiantown, just above the falls at St. John. The leisurely progress is prolonged by stops at numerous landings, which are a grief to the traveler who has the nervous habit of consulting his watch every few moments. But an occasion to forget a watch is while descending the St. John. To forget is not difficult since the watery way offers endless variety of wooded shores and fertile fields and orchards; of little villages with white church spires playing hide-and-seek with the trees; of booms where lumbermen keep their footing on floating logs as easily as if they were on a pavement; of mills where logs move with precision up the curved way that leads to the saws; of Indians camped on the bank or out in their birch-bark canoes; of farmers who row out in the stream to deliver a passenger or a can of milk or to receive a bit of freight, perhaps repairs for hayrake or automobile.

The slowly unfolding panorama includes the mouth of the Jemseg, where, in 1640, there was a French post. The glimpse of the winding stream gave birth to longings for an extra day to take the little steamer that traces the tortuous course up to Grand Lake, then along its varied shores. But there is just as much reason for going into Washademoak Lake, Belleisle Bay and Kennebecasis Bay, the broadening of the river of the same name before its marriage with the St. John.

Rugged rocks and towering headlands prepare the eye and the mind for the climax of the sudden contraction of the banks into the deep gorge where, at low tide, the water falls seventeen feet by means of tumultuous rapids, before its entrance to the Bay of Fundy. There are the famous Reversing Falls of the St. John, where, at high tide, not only is the descent overcome, but the water rushes inland like a mill race.

Geologists explain the strange spectacle by telling how, in prehistoric days, the Kennebecasis, now a tributary of the St. John, was really its outlet. The deep bay into which the Kennebecasis flowed became silted up, so that the water behind it was dammed. Then it overflowed the bank where the falls are today. In the course of ages it cut a deep gorge, perhaps four hundred feet wide, back into the basin. Now, when the tide comes in, the basin is so large and the entrance is so small, that the basin is not filled. Yet there is such a volume of water in the basin that the level remains high after the tide has gone out. The fall, or rapid, is the result.

Champlain and De Monts were the first white men who saw this marvelous reversing fall. This was in 1504, on St. John the Baptist Bay; hence the name given to the river. The first settlement was not made for nearly thirty years; then Charles La Tour built the fort, where he bartered for furs with the Indians until a rival captured the post during his absence.

The present city dates from 1763, when Loyalists from New England sought new homes there. A year later they had the joy of seeing their town become the capital of the new province of New Brunswick.

St. John owes its prominence not only to its ocean traffic, but also to the wealth of a vast interior. Everywhere are clubs for fishermen and for hunters. The Restigouche is one of the world's finest salmon streams. The fish frequently range from twenty to fifty pounds. No wonder the sportsman who finally succeeded in landing a frolicsome beauty said, with outward disgust, though perhaps with inward elation, "It doesn't weigh more than fifteen pounds!"

Along the St. John River, in New Brunswick, there is such beauty as is to be seen in these two photographs, the Grand Falls being shown at the right.

Too Much to Expect Coal Relief Thro' Courts

$21,000,000 "Melon" Cut After Sale of Producing Corporation Brings Charge That Actual Cost to Buyers Was About $2 a Share

A TECHNICAL argument and a bluff constituted the main facts in the defense of the attorneys for directors of the Central Railroad Company of New Jersey, when they were brought into court to answer charges of illegality in the sale of the Lehigh and Wilkes-Barre Coal Company to the Jackson E. Reynolds syndicate, of New York. The technical argument was based on the assertion, not proved, that the complainants in the case really represented another syndicate which claimed to have offered a higher bid. The bluff consisted in the assertion, by their own lawyers, that E. T. Stotesbury, Daniel Willard and Robert W. de Forrest were the most unlikely men to be found to carry out a fraud.

In a preceding article it has been explained how those three men, acting as a committee of stockholders of the Central Railroad of New Jersey, sold the Lehigh and Wilkes-Barre to the Reynolds syndicate. Isaac T. and Mary T. W. Starr, of Philadelphia, filed suit to have the sale set aside as illegal. Among the witnesses they called was Samuel D. Warriner, president of the Lehigh Coal and Navigation Company, who testified that he had been unable to get from officials of the Jersey Central or the coal company sufficient information on which to make an intelligent bid. At the eleventh hour he did get some of the information and filed a bid which it is claimed was considerably higher than that accepted by the three directors.

Three Bidders Offer More

THE bid accepted was for $185 a share. The Lehigh Coal and Navigation, which does not ship all of its coal over the Reading lines, put in a bid of $190 a share. But the latter company was forced to base its bid on a balance sheet of the coal company as of July 31, 1921, which was the latest information furnished by the New Jersey Central to any of the "outside" bidders. Another bid was entered by the Franklin Securities Company for a total of $31,920,144, but the bid of the Reynolds syndicate, for $31,410,980, was accepted. In attempting to justify this action the directors have held that the smaller bid carried interest on deferred payments, since the purchase was to be made on a plan of installment payments. Officials of the Franklin Securities Company have insisted that such interest payment was a foregone conclusion in any such financial transaction. A computation of the total yields to be expected by the Central shows that the bid of the Lehigh Valley was approximately two million dollars higher than that accepted.

It will be recalled that when the Federal court ordered the sale of the coal company it stipulated that the purchasers must be persons not already interested in that concern, the Central or the Reading company. In that connection the following paragraph is of interest. It is taken from the original complaint of those who petitioned to have the sale set aside: "Petitioners further aver on information and belief, that some or all of the members of the said Reynolds syndicate are interested, directly or indirectly, in the Central Railroad Company of New Jersey, and are, therefore, not qualified to purchase the said shares of stock of the coal company under the decree." The purchasers took affidavit that they were not so interested, but they were not required to disprove their connection with directorates interlocking with that of the Central. And it has been charged that after Reynolds, head of the syndicate, resigned from the Jersey Central directorate, he still attended meetings.

That $21,000,000 "Melon"

ONE of the most ugly features of the sale, however, concerned the $21,000,000 "melon" cut just after it was consummated. The directors knew of this huge accumulation of dividends. It has been charged that under the terms of the sale the members of the syndicate were called on to make an actual cash outlay of only $2 a share for their first payment, the rest of that payment being provided by the earnings of the company itself. And that brings up another point. It has been stated that the Reading company controls the operation of the New Jersey Central Railroad through ownership of some fourteen million dollars in the stock of that corporation. The real owner of the railroad, however, is the Lehigh Coal and Navigation Company, which leases the lines to the Central corporation. Some months ago the writer went into details of the huge profits obtained by the Lehigh from that source, and it is not necessary to repeat them to make the situation clear. The Lehigh Coal and Navigation already produces about four million tons of coal a year from its own mines. If it succeeds in getting control of the Lehigh and Wilkes-Barre it will be in a position to dispute with the Reading the monarchy of anthracite.

The whole point is that from present indications, any decision the court may reach will not make much difference to the ultimate consumer. The Reynolds syndicate has been shown to be backed by the so-called "Baker crowd" of New York. It is headed by a man who was formerly a director of the Central. Minority stockholders contend in effect that the whole situation looks like a conspiracy on the part of the railroad group of directors to sell the company to one of their own number, who could be trusted not to shift its huge tonnage to other railroads. But if the same directors had approved the sale to the Lehigh Coal and Navigation, the consumer would be no better off. More of the coal might move over the Pennsylvania or some other line; the profits to be taken by the Reading group might be reduced considerably. But instead of Reading control, there would be substituted Lehigh Valley control. And the president of the Lehigh Valley already has come to be recognized as the official spokesman for the big operators.

By WILLIAM A. M'GARRY

This is the second of two articles.

In view of all the facts, a curious phase of the case is the delicacy with which it is handled by all the attorneys. Senator Pepper, at the last hearing, made an argument from the facts which set up the plain implication of jugglery. He demonstrated that every effort was made by Messrs. Stotesbury, Willard and de Forrest to withhold information. One of the points which had been brought out was that on the day the sale was approved, some one of the directors of the Central noted that the bids of the Franklin Securities Company and the Lehigh Coal and Navigation were higher than that of the Reynolds syndicate. The answer was made, either by one of the three members of the committee or one of their associates, that the Reynolds bid was the highest because it carried interest on deferred payments. The suggestion then was made, according to sworn testimony, that officials of the other bidding companies be reached by telephone. It was considered a foregone conclusion that their bids also carried interest payments. But the inside directors were strong enough to overrule this suggestion, and they insisted on making the sale to the syndicate headed by their former associate, in which many of their closest financial associates were stockholders.

There was so much of this that Judge Buffington finally said to Senator Pepper: "If this sale was improperly made why not call it a fraudulent sale?" The Senator's answer was that he would not permit anyone to put words into his mouth. He did not deny that the sale was fraudulent, however; and he did intimate that there was a strong possibility of government action against those responsible for the sale. He said it could be construed as a violation of the intention of Section 10 of the Clayton Act, governing the sale of securities. And then he remarked, "This sale would not stand in any court if it were not for the big men in it." It was at that point that Richard V. Lindabury, counsel for the Central, made his effort to clear the three directors by mere statement, saying, "From the testimony and petition of the minority stockholders of the Jersey Central, one's first thought was, was there a conspiracy? To carry out such an alleged fraud and conspiracy can you think of anything more unlikely than the picking of three such men to carry out a fraud?"

Employes Bought Shares

THE same refusal to handle these "big men" of finance in the same manner as the minority stockholders, for instance, were handled on the witness stand and in all the references to them, was shown by A. F. Myers, assistant attorney-general. It will be recalled that at one stage of the proceedings the government itself asked that the sale be set aside. But on the day in question Stotesbury, de Forrest and Willard were in court, and all the attorneys were doing their best to make them feel at ease and not to question them too closely. Said Mr. Myers, in his address to the court: "Bearing in mind that the thing questioned is the good faith of the execution of the decree of this court, the government feels that it has fully discharged its duty as an aid to the court, insisting upon and aiding in a full and complete disclosure of the facts. More than that, government counsel feel that it would be presumptuous on their part to attempt to argue to the court their impression of the evidence here adduced and thus prejudice the court in the consideration of the case."

There is still another phase of the sale to which relatively little attention was paid by the attorneys. In the original petition and in the evidence produced, the latter contented themselves with an attack on the Reynolds syndicate as such, virtually the only member thereof singled out for attack being Reynolds himself. They could have had all the members of the syndicate into court, and it might have been of interest to learn where some of them got the money for the shares they purchased. Charles E. Ash, auditor for the Lehigh and Wilkes-Barre Coal Company, whose salary might be anywhere from four to six thousand dollars a year, subscribed for 200 shares of the syndicate stock, calling for a total investment of about $37,000. Charles H. Bonham, chief clerk of the Lehigh and Wilkes-Barre, took $18,500 worth. Douglas Bunting, general superintendent, bought in to the extent of $23,420, and Edward R. Clark, a clerk, bought $28,250. Edward Griffith, an assistant colliery superintendent, bought 250 shares, calling for an investment of $46,250 and Warren C. Johnson, controller, subscribed for stock in the syndicate to cost $92,500.

The list of subscribers showed many more employes, few of whom earn enough in salary to justify the large amounts for which they subscribed. All these men were hired during the time the Lehigh and Wilkes-Barre Coal Company was operated by the Central Railroad of New Jersey, which was controlled in turn by the Reading company, of which Mr. Stotesbury was chairman of the board. They owed their loyalty to the men who employed them. Mr. Reynolds, former director of the New Jersey Central and still attending meetings, intimate of Stotesbury and other financiers, directing the sale, went to these relatively low-paid employes and got them to buy stock. Where did they get the money?

It will be remembered that the court ordered that none of the purchasers of the coal company could be stockholders in the railroad. Here were men under the control of the majority stockholders and directors. What more natural than that they should be used as "straw men" in the division of the richest anthracite prize in years? And there are still other incidents to show how control of the tonnage was kept where it was before. The list of syndicate shareholders shows 20,000 shares were taken by the B-B Holding Company, the Burns Holding Company and M. F. Burns. Burns Brothers are the largest retailers of anthracite in New York, and for years they made a specialty of handling Lehigh and Wilkes-Barre coal. There is no way of showing that the B-B Holding Company is the same thing as Burns Brothers, but that isn't necessary. The Burns Holding Company took 10,000 shares, or $925,000 worth, on its own hook, and that company is headed by M. F. Burns, of Burns Brothers.

The Jay Gould Method

WHEN Jay Gould operated in railroads his favorite method was to issue stock as long as he could get away with it, until the amount of the actual investment from the public was far in excess of the tangible value of the property. If all those funds had gone into the railroads there might have been a chance for some earnings, but instead they went into the pockets of Gould and his associates, who got the money and still retained control. Since then the government has come to frown on stock-watering operations that are too obvious. But apparently there has been no material change in the methods by which control in a property turning up rich dividends may be retained, even when the Government of the United States orders that for the public good it must be sold. The Lehigh and Wilkes-Barre Coal Company has shown earnings in excess of five million dollars a year. It controls coal lands which are estimated to contain a total of 325,000,000 tons of unmined anthracite. At its present rate of production that means it can keep on earning upward of five million dollars a year for nearly a century, provided there are no further increases in the price of anthracite or reductions in the expense of mining that commodity, in either of which events its earnings would be larger.

It should be noted that the total stock issue of this coal company is given as only $9,210,000, and since it has been in the hands of the anthracite barons it is certain that it has gone through much the same process of stock dividend expansion as other big coal companies. Any citizen may make his own computations on the tonnage and profits of this corporation over which Wall Street is now at war. If it can earn more than five million dollars on the sale of four million tons, it is obvious that a considerable reduction could be made in the price to the ultimate consumer. Even if the coal were reduced one dollar a ton the company would still, on that showing, have profits of a million dollars a year, or more than eleven per cent on the par value of its stock. Of course there is little hope of any such reduction, since $8,489,000 worth of the stock at par value has been sold for more than $31,000,000, and higher bids are on record.

The Propaganda We'll Get

THE facts here set forth ought to be of particular interest in the near future, as the time draws near for the expiration of the agreement between miners and operators. Before long the publicity bureaus of the operators will be putting out propaganda to show that it is impossible for them to maintain the existing wage rates. Figures will be given to show the cost of mining a ton of coal, but there will be no mention of such profits as those shown by the Lehigh and Wilkes-Barre and other big operators. And nothing whatever will be said as to the methods still in use by the railroads to control the anthracite tonnage; methods which work just as effectively today as they did in the days of Gould, when there were no court orders against such practices.

Since it has been made clear that no matter to whom the Lehigh and Wilkes-Barre is sold, there will still be a trust, it is apparent that if the ultimate consumer is ever to get justice in anthracite it must be from some source other than the courts. In that connection a movement is now under way for the formation of a consumers' league which will contribute to a fund for a real survey and investigation of hard coal control. It may fail, like other movements. On the other hand, if it really wants to get at the facts it is more than likely that the miners will help, furnishing inside information that new investigators, unacquainted with anthracite conditions, could not expect to get on their own resources.

America, Land of Plenty, Producer of Foodstuffs

Farmers Find Their Happiest Solution of Marketing Lies in Co-operation

With superior boon may your rich soil
Exuberant nature's better blessings pour
O'er every land, the naked nations clothe,
And be th' exhaustless granary of a world.
—Thomson.

AMERICA, the Land of Plenty! From the Atlantic to the Pacific; from the sunny Rio Grande to the Canadian border, there are today thousands of acres producing agricultural products which feed the world. From the earliest days of colonization we have been adding to the native crops and stock new varieties. By eliminating the unfit and building up the better grades we now lead the world in quantity production of necessary foodstuffs. However, until our present Federal Department of Agriculture began sending its plant explorers to the ends of the earth in search of new crops, not a single new crop was introduced into this country since the colonial period except sorghum and alfalfa. The navel orange was one of the most important plant immigrants ever introduced into this country.

The tendency of our present civilization is to make of the farmer and rancher a producer of raw materials only, with the distribution entirely in the hands of the frequently inefficient urban centers. However, there are co-operative organizations which operate greatly to the farmer's advantage. Through this method the farmer improves both the growing and marketing of his product.

Dayton Editor Bows Knee to Jewish Rabbi

Concluded from page 2

sermon and could not let it pass unanswered. Dr. Isenberg discussed the sermon with Mayerberg in the most courteous and informative way, not suspecting the attempts that would be made to discredit or ruin him. When he informed Mayerberg that Jews had heard the sermon and at least one of them had expressed his approval of it, the rabbi termed that Jew a "blockhead" without asking for his name.

Dr. Isenberg informed the rabbi he had no objections to the sermon being answered from the pulpit of the Jewish Temple and obtained the clear impression that personalities would not enter into any phase of the discussion. It is enlightening to notice the way in which this professional agreement was kept by the rabbi.

This interruption of Dr. Isenberg's breakfast was but the beginning of an industrious Monday morning for Rabbi Mayerberg. Accompanied by F. J. Ach, a member of his congregation who has a deservedly high position in Dayton, but whose sensitiveness to alleged racial discrimination—doubtless put before him in an exaggerated or distorted manner—had seemingly been aroused, the rabbi called upon the executive editor of the *Journal*. What was said at this conference is unknown, but two definite things were done immediately after the callers left.

Harry McClain, the city editor of the *Journal*, who ran Dr. Isenberg's sermon, was instantly discharged, and it was arranged for the sermon to be omitted from the *Evening Herald*, the afternoon edition of the *Journal*.

During the day a number of Jewish laymen called at the *Journal* office to pay their respects and comment upon the publication of the sermon.

Evidently many other things took place because Rabbi Mayerberg's alertness and industry in securing redress for his grievances were obtaining unusual results.

"I Had to Do It"

READERS of the *Journal* of Wednesday, April 25, were amazed to read upon the front page the editorial reproduced upon this page. This is of national importance as concrete evidence of what some Jews would impose upon every newspaper whenever the right of free expression of opinion was exercised by an editor. It is also important to know that neither the publisher who signed this statement nor any of his executive employes gave Dr. Isenberg an opportunity to present his side of the case before the issuance of such an overdone blast.

It is said the publisher stated in response to certain comments upon his unjustified editorial by prominent members of the Central Reformed Church that "I HAD TO DO IT."

A prominent citizen who gave considerable attention to the affair has declared that Mayerberg wrote the statement signed by the publisher, but this cannot be verified.

But Wednesday's *Journal* contained more than the first-page editorial. On page three there was a column news story describing in a laudatory way the affairs of a Hebrew department store. At the head of another column on the same page there was this announcement prominently displayed as "pure reading matter":

RABBI MAYERBERG TO COMMENT ON SERMON.

Public Is Invited to Service to Be Held in Synagogue Friday Night.

Saturday morning's issue of the *Journal* contained a report almost two columns long of Mayerberg's "sermon." Violent and personal as were the attacks upon Dr. Isenberg contained in the newspaper story, **the most vicious parts simply had to be left unprinted.**

A Christian text was chosen—"Father, forgive them, for they know not what they do"—and cleverly employed to mask the fangs of the biting and sneering attack. Some extracts from the *Journal's* report are reprinted in this article. The sermon was cleverly planned to appeal to those Gentiles who have been persuaded to believe they must make any concession to the censoring proclivities of a certain sort of Jewish leadership to obtain general Jewish co-operation in civic affairs. That these well-meaning Gentiles have been deluded is shown by the independent Jewish approval of the sermon by Dr. Isenberg which aroused the ire of the rabbi.

What doubtless impressed Rabbi Mayerberg and his associates was their success in getting the Dayton Community Chest to become a party to their efforts to smash Dr. Isenberg. This is a serious matter, which will hardly pass unnoticed by the general public to whom it will be news for the first time.

Notwithstanding the existence of an active Council of Churches in Dayton with a paid secretary in charge, to whom a bona fide complaint could have been made, it is said that Mayerberg and his fellows *"induced" the Dayton Community Chest to appoint a committee of ministers to investigate the sermon of Dr. Isenberg's,* because of its alleged effect upon unity of effort among all the church-going people in Dayton. It is said the committee was charged with the duty of determining whether or not Dr. Isenberg should be publicly reprimanded or repudiated by this committee acting for the Community Chest, an association that is generally supposed to be completely isolated from religious affairs.

There are some Jews who are high in the councils of the Community Chest. It is easy to imagine how they might have treated a paid executive of the Community Chest who failed to respond sympathetically to demands for this investigation of Dr. Isenberg while their racial feeling was running high.

No publicity was given the appointment of this Community Chest committee. It is uncertain whether the official board of the chest authorized such action or a paid officer assumed such authority at the behest of the Jews.

While acting at the request of his Jewish critics, the Community Chest failed to consult either Dr. Isenberg or some lay officer of his church before dignifying the matter by appointing this secret committee.

When the Community Chest committee called upon Dr. Isenberg he gladly canvassed every point raised and practically repeated the sermon to them. The committee was, of course, perfectly satisfied with the utterances of Dr. Isenberg and so reported to those at the Community Chest who had asked its members to accept such service. No action was taken by the Community Chest.

Just where the Community Chest obtains its authority to probe and review the utterances of a Christian minister with a view of publicly censuring him is not apparent. Certainly neither its charter nor its contributors would uphold it in aping the Inquisition. It bears all the earmarks of yielding to pressure.

Dr. Isenberg's church has treated the attacks upon its pastor with silent contempt. He is stronger than ever. The people of Dayton believe that Dr. Isenberg was truthful and fair in his sermon. Privately they agree with him in every way. Current comment indicates that Rabbi Mayerberg overplayed his hand. The editorial was especially distasteful to independent people, who objected to such a tirade against a prominent Christian minister who was not given the courtesy of a request for an explanation before he was attacked after complaint by the rabbi.

The reported move to place Rabbi Mayerberg upon the Dayton public school board remains to be considered. While such selections may be manipulated, it would be surprising if the people of Dayton were to put the rabbi in a position where he could impose his racial consciousness and the full power of his position upon the school officials and teachers whenever he took exception to the handling of Jews in the teaching of history and literature. Since such demagogic impositions have been made upon some other public schools, Dayton is forewarned.

One Rabbi's Tactics

WHILE resident in Philadelphia, Dr. Isenberg was brought into personal contact with Federal prohibition officers and it would seem that his statements upon this phase of his sermon were based upon first-hand information from authorities. Of course it is doubtful if any Federal official would dare make such statements about the Jews in a public official report, but the situation is impressive and convincing.

The rabbi has been active in other ways in dragooning those who discuss the Jewish problem with any freedom and avail themselves of what they believe to be their rights.

Dayton people on their own initiative and long before the rabbi came to Dayton, have always been more than fair toward the Jews. There never has been the semblance of trouble between Dayton Gentiles and Jews until recently when certain of their spokesmen began fighting shadows.

In fact, there has been a decided tendency for the majority of Jews who are first of all American citizens to amalgamate with the rest of the people in Dayton. Perhaps some rabbis are coming to find they can only fill their synagogues and retain their leadership by sounding the alarm of "Jewish persecution."

People in Dayton who cannot be overawed by the sort of tactics employed in this case laugh at the overheated atmosphere created by the rabbi and his kosher kitchen cabinet. It brings Humpty-Dumpty to mind.

Music Wins Passport From Bela Kun's Wife

Concluded from page 10

your fur neckpiece with the Dutch money—and your diamond ring, too."

"The train whistled and rolled into the station. An enormous bustle of foreign passengers, joyous to leave the Bolshevistic country, and I found myself on the train looking out at my mother, who stood before the window. I never even realized where I was and kept my eyes fixed on the dear face, quiet and smiling as ever—until the train started. Then I sank back in the seat and a few minutes passed, during which I thought of nothing, save the dearest being on earth whom I had left.

* * *

The middle of the night approached. I lay outstretched on one side of the compartment, a French girl on the other side. We did not sleep and both of us jumped up at once as the door was thrown open and two Bolsheviki officers stepped in.

"We came to inspect your passports," the one said shortly. Both were young and I did not like the expression on their faces. They examined our passports and sat down as though they intended to stay. I began to feel uncomfortable. I glanced at the officer next to me and as my questioning eyes met his, I perceived an evil, mocking smile on his face. Now I realized the danger in which we were, shut up in the small compartment of the noisy train with two strange Bolsheviki officers. A glance at my fellow passenger proved to me that she had understood the critical situation before. The young French woman pressed herself in a corner, utterly terrified, a helpless little dark bundle.

My instinct told me that this was not the hour to show myself afraid. I always believed in the inborn chivalry of men, and thought that a man was what the women he knew intimately had made him. I had seen my own mother tame the rough Proletarians and as I thought of it perfect self-possession came over me.

Now one of the men began to speak in a cruel, hard tone:

"Do you know, you two young ladies, that you are here entirely in our power?" and bending forward he looked straight into my eyes.

"I know that we are on a British train and that I am under the special protection of the Norwegian Consulate," I answered without turning my eyes away and feeling myself stronger and stronger as I heard my own voice.

"And if I put my arm around you will the Norwegian Consulate protect you?" my neighbor inquired, but he did not move.

"Mrs. Bela Kun, who secured me the passport herself, will be pleased to hear how her subjects behave," I answered contemptuously. "She specially requested me to write her a postal card after my arrival."

The two men looked at each other and changed their countenance.

"How on earth do you happen to know Mrs. Bela Kun?" one of them exclaimed. "Are you not a noblewoman escaping with your pearls to Austria?"

"I am not escaping at all," I laughed. "I go to give some concerts as you may see by this letter. And your friend, Bela Kun's wife, expressed her best wishes for my success and asked me to return to Budapest soon."

Bolshevism Face to Face

THE evil-meaning expression disappeared from the faces of the two men and they seemed puzzled.

"As a young lady you ought to be afraid of two Bolsheviki," my neighbor remarked. "You do not seem to realize who we are. Just look here."

With this the Reds began to unload their pockets. They had all sorts of arms: revolvers, knives, stiletto, and these the men put out on both their sides on the seat.

I had not expected such a characteristic exhibition, but did not act surprised.

"I have got a revolver, too, but I never had to use it," I said unconcernedly. "You men are the weaker sex after all, for you need arms to protect yourself."

As they stood in the door before going, one of them looked at me earnestly.

"I am a Bolsheviki and you are something very different," he said. "Nevertheless, you are my compatriot and I am proud of you. I do not understand yet how you were not afraid of us."

"I knew that some Bolsheviki were gentlemen," I replied, laying the tips of my fingers in his outstretched hand.

We were not disturbed further during the rest of the journey. It was a long and tedious way. About 12 o'clock the following noon the Hungarian frontier town, Kiralyhida, was reached. The trains did not run through to Austria. From the last Bolsheviki station one had to walk over to the small Austrian village, Bruck, from which the train to Vienna left only the following morning. The passports and luggage had to be examined on both frontier stations.

Two soldiers threw themselves on my open trunk and another one beckoned me to a small cabin, where a woman waited, dressed in a gray uniform with red.

"Enter there, Citoyenne, you will be searched to see if you carry no valuables."

I felt sure that my money would be found and entered the small wooden cabin with perfect resignation. I threw my hat, coat and fur on a chair and heard the woman say shortly: "Please undress."

I dropped my clothes on the floor carelessly, one piece after another and remained standing in my thin chemise. My eyes followed the woman's ugly hands which touched my body all along where the chemise covered it to see if I had no valuables hidden. The woman then put her hand on my head and examined my hair. Then she picked up my clothes and began to search them. She found the 3,000 franks in the hem of my dress and took possession of it triumphantly. She stepped out of the cabin while I dressed in haste. I hardly dared to think of my fur neckpiece, where 200 Dutch florins, the emerald cross and my diamond ring were hidden.

Outside, the soldiers who searched my trunk had found the English gold pieces in the meantime. As I came toward them they announced to me very merrily:

"You can continue your journey without this money—nothing more than 300 crowns are permitted to be brought to Austria."

I locked my trunk without speaking. I was asking myself the question if I should return straight to my mother, or continue my journey without my money? The whole situation seemed unreal like a dream.

The Bolsheviki were through with me. A porter stood near and looked at me with some sort of sympathy. He grabbed my suitcase, whispering encouragingly: "Come quickly to Austria."

I had just time to hear a passenger raving for his 14,000 crowns that had been found and taken and I followed the porter in a daze.

After a few minutes' walk we reached a gate which formed the frontier. Austrian soldiers stood on the other side and hardly had I stepped on Austrian ground than a well-known face greeted me with a relieved, happy smile. My second cousin, Ivan, stretched out both his hands to welcome me.

A third part of this narrative of Margita de Regeczy's experiences will appear in an early issue.

A Radio Broadcasting Service to 24,000,000 Persons

Distribution of Crop and Market Reports Through Air Reaches Seventy-five Per Cent of Folk to Whom the News Is of Benefit

By S. R. WINTERS

HANGING on the wall of a government office in Washington is a map perforated with pins of varying colors. Introduction to the personality seated at the desk in this office—J. C. Gilbert—brings an explanation of the symbolic colored pins and their injection into the land-and-water sketch of our country. Without further ado, this writer introduces the office as the guiding force of probably the most comprehensive system of disseminating agricultural information yet conceived. The Bureau of Agricultural Economics of the United States Department of Agriculture is the governmental agency under whose supervision the nation-wide distribution of crop and market reports cover the entire United States as though a blanket enveloped the area and its 110,000,000 inhabitants. The vehicles for broadcasting the conditions and prices of agricultural commodities are the radio telephone and telegraph.

J. C. Gilbert, whose official title is specialist in market extension, is largely responsible for the formulation of the system for broadcasting the news services pertaining to live stock and meats, dairy and poultry products, fruits and vegetables, hay, feeds and seeds. From Maine to the Gulf of Mexico, and from the Atlantic to the Pacific oceans, the radio market news service is perhaps available to 24,000,000 rural dwellers and to an untold number of inhabitants of cities who care to know the prices of cabbage, eggs, beef, hay, and what not. The name, J. C. Gilbert, may be strange to the ears of the readers of this magazine, unostentatious person that he is. However, if a worker is best known by his work millions of the rural population of America must feel a speaking acquaintance with the virile personality whose likeness appears on these pages. Busy organizer that he is, planning and executing a uniform system of disseminating information relating to agricultural commodities, his own self has remained in the background. Save his appearance in a group photograph of the government representatives attending a radio telephone conference the picture illustrating this article is perhaps the first portrait published of the individual whose programs of market news service invade the isolated as well as the frequented areas of the entire country.

Mr. Gilbert is a native of Colorado, and received his academic training in the Oklahoma Agricultural College, Iowa State College, and Washington State College. He has traveled extensively at home and abroad. His excursions back and forth across the continent have taken him into every state excepting Nevada. As specialist in market extension, he now makes periodical trips into the various sections of the United States. Field activities, in mapping the radio market news service for a state agricultural college, a newspaper, or other medium for disseminating the fluctuating values of agricultural commodities by that rapid-fire vehicle, the wireless telephone and telegraph, have caused him to visit every state east of the Missouri River within the past twelve months. He has been identified with the market news service of the Department of Agriculture since 1915, with the exception of 1919 and 1920, during which time he served Pennsylvania in a similar capacity.

As interesting a personality as J. C. Gilbert is, the writer experiences difficulty in disassociating him from the big idea to which he is pledged, namely, the systematizing of the broadcasting by radio telephone and telegraph crop and market reports to approximately 24,000,000, and ultimately 32,000,000, rural dwellers. Reverting to the pin-perforated map of the United States hanging on the wall of his office, the color of a particular pin indicates the character of service rendered by every wireless broadcasting station in the entire country. This five by eight representation signifies that the crop and market reports originating with the Bureau of Agricultural Economics of the United States Department of Agriculture are borne on electromagnetic waves into every state. While centralized marketing agencies, such as are maintained by some of the state agricultural colleges, are not established in every commonwealth, yet the Federal Government through the powerful broadcasting stations of the Navy Department and Post Office Department is enabled to make available this eminently valuable agricultural information to about 75 per cent of the farming folk.

"One outgrowth of this service with which I am particularly impressed," says Mr. Gilbert, "is the generous support the newspapers are according the movement of disseminating market news by radio telephone. Large newspapers such as the Detroit *News*, Memphis *Commercial-Appeal*, Atlanta *Journal*, and Kansas City *Star*, stand out as notable examples in furthering this campaign to make available to the rural population prices of farm commodities with dispatch. Sixty-five newspapers are licensed to broadcast. Then, too, the state agricultural colleges are liberal supporters of the cause, notably, the Iowa State College, University of Wisconsin, Kansas State Agricultural College, University of Minnesota, Michigan Agricultural College, University of Texas, the University of Nebraska, and University of Ohio."

Mr. Gilbert, in his trips afield and as reflected by the growing volume of correspondence, detects a sentiment among certain banks that they realize the possibility of employing the radio telephone broadcasting station for speedy communication of financial news of interest to their corresponding banks in the rural districts. Such a movement contemplates the sending forth by this hurry-up method of intelligence information relating to the prices of agricultural commodities and securities listed with the particular city financial institutions. The Union Trust Company, of Cleveland, and the Mercantile Trust Company, of San Francisco, contemplate rendering their corresponding country banks such a service.

If a newly established broadcasting station in applying to the Bureau of Navigation of the United States Department of Commerce indicates a desire to send forth market reports, this particular feature of the application is referred to Mr. Gilbert. Recently a Washington representative of a certain newspaper received a telegram from its managing editor expressing a desire to obtain immediate temporary permission to broadcast crop and market data. The telegraphic communication was referred to Mr. Gilbert and the wish was granted without delay. Approximately 100 letters a day are received by him, seeking all sorts of information relating to the service which finds the radio telephone and telegraph the most useful vehicle of dissemination yet placed at the command of Uncle Sam.

"The radio has not only proved to be a speedy vehicle for disseminating market and crop reports, but has actually enhanced the interest in this character of information," was the comment of this writer, put in the form of a query to Mr. Gilbert. His reply was not only in the affirmative, but was voiced so enthusiastically that there was no mistaking his conviction. The Washington office might be characterized as the throttle of the engine of a locomotive, to employ a figure of speech, in its relation to the state agricultural colleges, newspapers, and other agencies engaged in spreading the fluctuating prices of farm products to the rural communities in which they are located. The Bureau of Agricultural Economics of the United States Department of Agriculture is the fountain source of such data and maintains supervision over its dissemination. Yet, acting through its field representatives and state agencies, the constant effort of the Washington office is to tie up the local broadcasting stations with a centrally located state agency, which may be an agricultural college or a state marketing bureau. The system, as developed by Mr. Gilbert, is unified in purpose and scope and yet local in its application.

Off duty—and precious are his leisure moments—you will doubtless find J. C. Gilbert at his Washington home exploring into the mysteries of radio instruments and the electromagnetic waves upon which is borne a national crop-reporting service. Condensers, loose couplers, vacuum-tube amplifiers, static, dielectrics, microfarads, and a host of other terms which pervade the atmosphere of the ether and the appliances by which communications are sent forth and received, lend variety and fascination to his evening hours.

To Revive Pony Express to Honor Mark Twain

Concluded from page 7

ones to men who had seen neither—some of them—for more than a decade. From Placerville, to which the "Alta Telegraph" had a wire, came the word, "He passed through here at 1:50 this afternoon, going like hell." He was late, and the superintendent of the Sacramento Valley Railway offered an engine to pull him in from Folsom, but the offer was spurned indignantly, and the brave little roan pony, making the last five miles in twenty minutes, dashed into the Alta Telegraph office, as the cannon in Sutter's Fort roared a welcome to the first overland mail in the New World. Eighty letters were brought in this mail, which had left St. Joseph in the hands of Johnnie Frey.

The riders received $125 to $150 a month and their horses, and each was required to take an oath to refrain from intoxicating liquors and profanity while in the employ of Russell, Majors & Waddell, owners and operators of the Pony Express. Among the more noted of the many riders who at one time or another carried the mails for this company were Jim Moore; William Cody (Buffalo Bill); Robert Hasalm, better known as "Pony Bob," on account of the great consideration and care with which he treated his horses; J. G. Kelly; George Gardner; "Boston Sam" Hamilton, and "Irish Tom" Grady. John Seebeck, one of the later riders, still lives in Alameda, California, and with Greene Majors, son of Alexander Majors, one of the founders of the Pony Express, was a guest at the unveiling of the memorial tablet in Sacramento. Postal charges were reduced from $10 an ounce, the first rate, to $5 a half ounce, and, eventually, to $1 for a half-ounce letter.

For many years the exact location of the one-time office of the Alta Telegraph, in Sacramento, was lost, but eventually it was re-located at 1015 Second street, and found from the old records to be the same building, unchanged except for repeated coats of paint and some minor improvements to the roof. The identity of the building finally was established by H. C. Peterson and John McIntire, of the research department of the California State Historical Library, and it will be the center of the Sacramento celebration of the revival of the Pony Express.

The principal points along the route of the Pony Express have announced their plans for the celebration as extending over one week in each place, so as to allow for the passing each way of the riders. Hannibal, Missouri, where Mark Twain spent his early boyhood, will have a special celebration, though it is not on the trail of the Express, and St. Louis has asked to come into the series of celebrations, with an industrial and development exposition, showing what has been accomplished since Johnnie Frey left the Mississippi on the morning of April 3, 1860, with the first mail for the Pacific Coast.

The most permanent of all the results of the revival of these famous riders will be the statue of Twain, to stand permanently on the Comstock Lode, which he made famous in his stories of his life in the West. The clay original of the statue, as designed by Mr. Burnham, represents the humorist standing on a huge boulder, looking off across the ranges, his old soft hat shoved far back on his unruly hair, a notebook in one hand and a pencil in the other. Men who knew Twain in those days declared that the sculptor has caught his expression of face, and his favorite standing position to a remarkable degree. Small replicas of the statue, cast in bronze and brass, will be sold to pay for the larger statue.

At the end of the westward trail, the riders will be entertained by a repetition of the famous "Days of '49" celebration, staged at Sacramento last year, and to be repeated especially for this Pony Express revival this autumn. In San Francisco, the Admission Day Celebration will be in full swing, honoring the admission into the Union of the only state which was never a territory. Two old Concord stages, once used as public conveyances between Sacramento and San Francisco, have been found, and these will head the procession which is planned to accompany the modern Pony Express rider from the capital of the state to San Francisco.

BRIEFLY TOLD

Mrs. Lloyd-George says: "Bringing up a family is a full-time job—an overtime one if the family is large—and no working-class mother can combine it properly with wage-earning.

Professor Robert DeC. Ward, of Harvard University, writes: "No possible temporary advantage to be gained by the importation of cheap alien labor could in any way offset the incalculable harm which such an influx would inevitably do to our country and our race. The question of profits is not for a moment to be considered as more important than posterity."

From 300,000 to 500,000 transient laborers pass through Chicago in a normal year.

Numerous flint implements, bone harpoons, arrowheads, grindstones, chisels and tooth-headed spears have been discovered in the remains of a settlement at Holmegardsmos, Denmark. It is estimated the settlement is at least 7,000 years old. Although no human bones have yet been found, the excavators uncovered skeletons of elk, reindeer and other animals under a layer of peat several yards thick.

The Mark Twain State Memorial Park Association plans to establish a Mark Twain Memorial Park in Florida, Missouri, where the humorist was born. The owner of the home in which Mark Twain was born has promised to donate the house and its old-time curios to the association.

The largest seed-oyster supply in the world, in the James River, Virginia, is threatened with destruction because of the effects of pollution of the water. Last December and on April 10, of 1923, wild ducks were picked up helpless on the New Jersey coast at Cape May. The oil-coated waters gummed the feathers of the birds and prevented them from flying. Inland waters are also polluted by factory waste, causing the death of thousands of fish.

Craigdarroch, the home of Annie Laurie, is for sale. It was at Craigdarroch that the real Annie Laurie lived after she was married to Alexander Fergusson, the prosperous laird she chose in preference to Douglas of Fingland, who wrote the song that made her famous.

Edward Page Gaston, an archeologist and brother of Lucy Page Gaston, of anti-cigaret fame, is searching at Gravesend, England, for the bones of the Indian Princess Pocahontas whom he claims as an ancestor. Indignant Britons whose forbears lie buried with the legendary savior of Captain John Smith have threatened Gaston for violating their dead in his search. Although armed with a permit from the home office and accompanied by British anthropologists, he is meeting with much resistance. Marquis Curzon, foreign secretary, has added his voice to the protest against the search at Gravesend.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The Opium Committee of the League of Nations voted, six to one, for strict limitation of production and sale of the drug under absolute government control; Portugal failed to vote, and France voted against it.

Translated into food, at the prices the farmer gets, it takes sixty-three and one-half dozen, or 762, eggs to pay a plasterer for one day of eight hours work in New York City. It takes seventeen and one-half bushels of corn, or a year's receipts from half an acre, to pay a bricklayer one day. It takes twenty-three chickens weighing three pounds each to pay a painter for one day's work in New York. It requires forty-two pounds of butter, or the output from fourteen cows, fed and milked for twenty-four hours, to pay a plumber fourteen dollars a day. To pay a carpenter for one day's work, it takes a hog weighing 175 pounds, representing eight months' feeding and care.

Prof. Charles Sprague Sargent, director of the Arnold Arboretum, has received the Meyer Medal for his services in preserving the vanishing tree species of the world. The Arnold Arboretum contains the largest collection of trees and shrubs in the world. The medal is named in honor of Frank N. Meyer, noted leader in the work of plant introduction, who lost his life while hunting for new trees in China.

Historic Faneuil Hall, the "Cradle of Liberty," in Boston, will not be defiled by the installation of a modern elevator. The hall is to be renovated in the near future and the city council has appropriated $200,000 to that end. All floors, walls and ceilings are to be covered with fireproof metal, and wooden awning supports will be replaced with fireproof construction. But patriots threaten to seek a grand jury indictment against anyone who would attempt to install an elevator. The Ancient and Honorable Artillery Company will continue to walk upstairs to their meetings.

Final passage of the bill to abolish the county convict lease system in Florida was effected when both houses agreed to the report of a conference committee. The practice will be outlawed after January first, next.

The days of the Klondike were recalled at the Waldorf-Astoria recently when the hotel treasurer sold $5,000 worth of gold dust and nuggets to the government. A Westerner arrived at the hotel with no baggage and with very little cash. He had several pokes of gold which he asked the hotel treasurer to guard. When he was ready to leave he requested that the gold be sold and the hotel bill deducted. The government was a ready purchaser.

Canadian farmers are importing wasps to fight the corn borer.

The *Globe and Commercial Advertiser,* of New York, the oldest daily newspaper in America, passed out of existence recently when it was merged with the New York *Sun.* The *Globe and Commercial Advertiser* was founded in 1793.

Thousands of women and girls were thrown out of employment in factories by the French occupation of the Ruhr district, but ignore domestic service offered them because they receive strike funds from Berlin and local municipalities amounting to more than wages in homes. It is as difficult to obtain housemaids in Germany as in this country.

Riding from the first platform of the Eiffel Tower to the ground on a bicycle was the daring achievement of a young Frenchman. In the first leap the bicycle covered forty steps. The remaining 316 steps were covered at the rate of from fifteen to twenty in each jump. In less than one and one-half minutes he had covered the entire distance of ninety yards and was only slightly scratched on one leg as he rounded a post at the bottom. Not a burr on the bicycle was loosened.

Bats are very particular about their personal cleanliness. They wash their faces with the front part of the wing, and currycomb their fur with the sharp claws of their hind feet. The young are born in June and number one or two. For two weeks after birth the young hang to the mother and are carried by her on her nightly flights.

CHRONICLER OF THE NEGLECTED TRUTH

Tobacco, Tombstones and Profits

By LUTHER BURBANK

YOU have seen pictures of military cemeteries near great battlefields. Upon every headstone is chiseled the inscription, "Killed in action."

If one knew nothing about war, these headstones would be sufficient to impress upon him that war is deadly—that it kills.

How much would you know about tobacco if, upon the tombstone of everyone killed by it were inscribed, "Killed by tobacco"?

You would know a lot more about it than you do now, but you would not know all, because tobacco does more than kill. *It half-kills.* It has its victims in the cemeteries and in the streets. It is bad enough to be dead, but it is a question if it is not sometimes worse to be half-dead—to be nervous, irritable, unable to sleep well, with efficiency cut in two and vitality ready to snap at the first great strain.

This seems like exaggeration. It isn't. It is well within the truth. You do not know the facts because you are not permitted to know them. It is profitable slowly to poison you and millions of others, so you are poisoned. You were only a boy when you were urged to smoke cigarets. A little later you saw advertisements in which your attention was called to cigars and smoking tobacco. Now you are pressed to use tobacco in all its forms, except as snuff. You can buy snuff if you want to, but it is not urged. Perhaps there are too many false teeth in America to make sneezing popular. But chewing and smoking are set forth by the tobacco trusts as delightful, harmless pastimes. It is even declared that the use of tobacco is beneficial—that it "soothes" the nerves.

Chloroform soothes the nerves, too. A small bottle of it will soothe them forever.

Let me tell you how tobacco kills. Smokers do not all drop dead around the cigar lighters in tobacco stores. They go away and, years later, die of something else. From the tobacco trust's point of view, that is one of the finest things about tobacco. The victims do not die on the premises, even when sold the worst cigars. They go away, and when they die, the doctors certify that they died of something else—pneumonia, heart disease, typhoid fever, or what not.

> "IF," pertinently asks Mr. Burbank, "tobacco is such a fine thing, why don't its victims rejoice?"

In other words, tobacco kills indirectly and escapes the blame.

What killed General Grant? Why, of course you know—cancer. But what caused the cancer in his throat? Do you know? Smoking caused it. General Lee could not get Grant, but tobacco got him.

What killed President McKinley? An assassin's bullet, you say. Partly right and partly wrong. McKinley was shot, but his wound need not have proved fatal. Thousands of men, hurt worse, have survived. But they had good hearts. When a great strain comes, strong hearts are necessary to bring the sufferers through alive. McKinley, when he was born, had a strong heart, but the tobacco habit got him and left his heart muscles soft and flabby. When McKinley had need of a strong heart he went down because he had nothing to keep him up. He had smoked up his most vital strength.

Woodrow Wilson when old was seized by an ailment that brought him almost to the point of death. For hours he was unconscious and for weeks his physicians could not say whether he would live or die. He had need of a good heart. In his hour of need he had a good heart. If Mr. Wilson had been a smoker, Mr. Marshall might have been President.

In the African jungle, Theodore Roosevelt was stricken with such a fever that he begged his son and other companions to save themselves by leaving him to die. He, too, had need of a strong heart—and he had one. Mr. Roosevelt never used tobacco. His African illness was so serious that he returned to America emaciated and shaken, but he at least had the heart-power to enable him to get back.

But the case for or against tobacco cannot be conclusively proved by what happened to this or that man. The point I am trying to make is that when the pinch comes everyone has need of all the heart-power he can muster—and tobacco weakens heart-power. There is no doubt about that. When one's heart is faltering, no doctor ever prescribes nicotine. Nicotine is a slow poison that strikes at the heart first.

Nicotine, after you have used it a while, puts you in a condition to be "bumped off" by the first thing that hits you. If you saw some men undermine a building until it was ready to topple into the street, and then saw a woman hit the building with a baby carriage and make it topple, you would not say the woman wrecked the building, would you? Yet when a smoker dies of pneumonia the doctor's death certificate gives pneumonia and not tobacco as the cause of death. And the tombstone man with his chisel says nothing at all.

What a shock people would get if they went through cemeteries and saw tombstones declaring the fact that this man died of typhoid made fatal by a tobacco-weakened heart, and that man succumbed to nervous prostration because tobacco had shot his nerves to pieces, and another one gave up the ghost because tobacco had ruined his stomach.

But the truth will never be known about tobacco so long as the great tobacco companies are able to spend millions of dollars to build up and maintain businesses with which to poison the people for a profit.

Did you ever think what would become of the tobacco habit if there were no profit in selling tobacco? How long would it last and how rapidly would it spread? Was anyone ever born with a taste for tobacco? On the contrary, everyone is born with a taste *against* it—tobacco produces sickness the first few times it is used. Men are able to use tobacco only because of the remarkable power of the human body to adjust itself to an unfavorable environment. The human body prefers the good and dislikes the bad, but if it is compelled to endure the bad will make the best of it and stick to life as long as possible.

If there were no money in poisoning people with tobacco, the tobacco habit would die out with the last of its present victims. No boy could begin smoking because there would be no place where he could buy tobacco. If there were no place in which to buy food the boy would not go without food. That shows the difference between useful necessities and poisonous things that enslave only to destroy. We need food; we do not need tobacco. We use tobacco only because it is foisted upon each generation as opium was foisted upon the Chinese, and as cigarets are being foisted upon us now.

As the tobacco interests become better organized it is increasingly difficult for each generation to escape. Even thirty years ago, a cigar store was an ugly place, littered with cuspidors, dirty and unattractive. Better brains in the tobacco business have changed this. The cigar store is attractive now, even from afar. Its windows are tastefully decorated with red, a primary color that appeals to the lowest order of intelligence. Inside, everything is as clean and bright as if the place were a jewelry store. Every possible appeal is made to the eye. And, in addition, there are certificates with which, if one will smoke his head off, he may get a beautiful glass fruit dish for his grandmother or a collar button for himself.

Billboard advertising, newspaper advertising, magazine advertising, search every nook and cranny of the country for victims. In this way, millions upon millions of dollars are spent by the tobacco interests every year. It seems almost as if there is no escape for each new generation as it comes along. No matter where a boy may be, tobacco advertising reaches him, pleads with him and urges him to be a fool—to injure his health, decrease his happiness and shorten his life that the tobacco interests may gather more millions.

If the money that the American people are wasting for tobacco were invested in homes, every man and woman could have a home, free of debt, before reaching the age of fifty.

If it were invested in farms, everyone could have a farm.

If it were invested in reclaiming deserts that, with water, would be orange groves, the present century would see the end of most of the deserts.

If it were invested in stock in water-power companies honestly and wisely managed, the harnessing of power now going to waste would make heat, light and power abundant and cheap.

If it were invested in traveling, the saving would be sufficient to enable everyone to see all America several times and take at least one trip around the world.

Figure it out for yourself. The ordinary smoker who uses cigars will burn up about a dollar a day, which is about $1,000 every three years. If smoking, after thirty years, kills him, he will have wasted $10,000. That is more than enough to buy a decent home, a good farm, or to see America several times and take a whirl around the world.

And, at that, the greatest loss is in health and life. The basis of all happiness is health. A sick millionaire is much worse off than a well garbage man. Sickness not only cuts off happiness but brings discomfort and pain.

Always remember that the tendency of tobacco is to destroy.

Don't be fooled by newspaper stories inspired by the tobacco interests about gentlemen 104 years old who attribute their multitude of years to the use of tobacco.

When whisky-selling was a legal method of getting a living you used to read the same kind of stories about centenarians who had drunk whisky since they were nine years old.

There is no doubt that some men have lived to be very old, notwithstanding the use of tobacco and whisky.

But they are entirely mistaken in believing that it was the tobacco or the whisky that helped them to live long. Here is one proof: Look for all those who were boyhood chums of these aged survivors of tobacco and whisky and who, like them, smoked and drank. Where are they? In graveyards. Tobacco and whisky helped to put the finishing touches upon them.

The one in ten millions or more who survives and reaches a great age, notwithstanding the use of tobacco or whisky, is the odd one who, because of some peculiarity in his constitution, was able to generate an antitoxin that offset the poison of nicotine or alcohol. Each of us has the ability, to a greater or lesser degree, to develop antitoxins to meet our needs. Smallpox kills the Indian and treats the white man comparatively gently because it is a new disease to the Indians, to meet which they have not yet had time to generate proper antitoxins. The white man, on the other hand, has had time to develop antitoxins. Smallpox is no new disease to him. He has been familiar with it for centuries and, in the beginning, it hit him as hard as it now does the Indian.

Make no mistake. Tobacco is a poison that would not be urged upon you if there were not a profit for others in making you a victim.

Within my own circle of friends and acquaintances I have known many, or at least several, men whom it has killed.

I never met a tobacco-user who did not regret that he had formed the habit, but I never met a non-smoker who was sorry he did not smoke.

Isn't that significant? If tobacco is such a fine thing, why don't its victims rejoice? Why do not men like Woodrow Wilson hasten to acquire the tobacco habit? Think this over.

Youth is the dangerous age, as far as tobacco is concerned. If one can reach the age of twenty-five without smoking, the tobacco trust will have difficulty in getting him.

We are in the process of driving alcoholic beverages from the country. The death rate all over the country has taken a sharp drop to the lowest point ever reached. In my opinion the day is not far distant when we shall outlaw tobacco as we have alcohol. I believe tobacco shortens more lives and kills more people than alcohol ever did, not because tobacco is more deadly. because it is more widely used than whisky ever was.

We shall have better health, more happiness, longer life and more comforts when we cease wasting our money for tobacco and whisky. There are now plenty of persons who will hoot at this statement, but in a few decades there will be a hundred millions or so who will hoot at the present hooters.

Motion Pictures of the Human Heart Used in Diagnosis

American Mechanical Wizard Makes Possible the Cardiograph, Now Employed in Many Hospitals

Attaching the electrodes to take a cardiograph of the human heart.

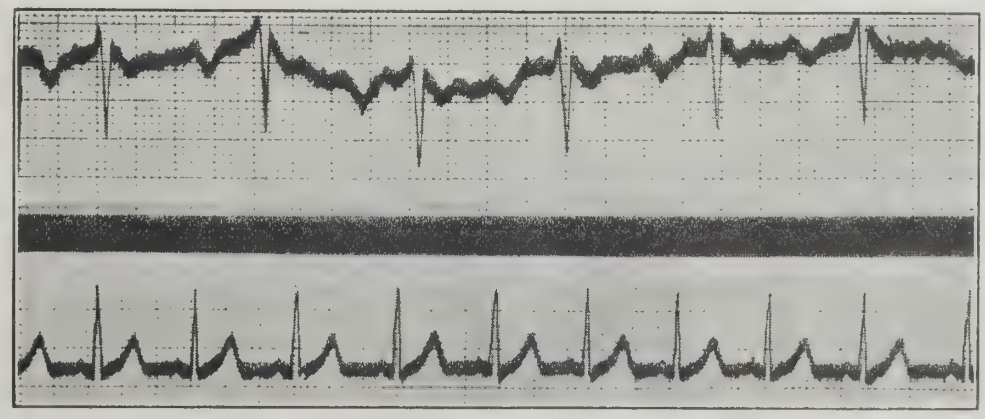
MOTION pictures of the human heart, accurate to minute fractions so small that they cannot be seen with the unaided eye, have taken the place of clinical diagnoses in the treatment of heart troubles in nearly every big city of the United States. So definite are the results obtained that it is only a matter of time, in the opinion of heart specialists, until no medical practitioner will think of telling a patient what is the matter with his heart until he has a motion picture record of its activities. And when that time comes the world's greatest scientists and all of mankind will take off their hats to an American mechanical wizard who accomplished something that had baffled science for twenty years.

The cardiograph, which is the name of the machine for photographing heart action now in use in many big hospitals, is not merely a movie camera. It utilizes a motion picture film and a photographing apparatus operating through a powerful microscope, but it also includes what might be described at first glance as a cross section of nearly everything electrical. Briefly, it is a machine so highly sensitized that it can pick up what might be called the waste power produced by even the weakest human being in the form of electrical currents thrown off at the extremities, and by means of a gold-plated quartz wire four ten-thousandths of an inch thin, make that power reproduce itself on the motion picture film.

The cardiograph and the principle underlying it have been known to medical science for many years. In 1856 it was discovered that every contraction of the human heart is preceded by what has been called an "excitation wave," then more or less of a mystery. In 1887 a British physiologist discovered that this wave produced electrical differences between points on the surface of the body, and they could be detected by a sensitive galvanometer. Attempts were made at once to measure them. They failed because the galvanometers then in use were too slow. In 1903, however, M. Einthoven, of Holland, succeeded in producing the first cardiograph. The principle used is still in use. It had long been known that if a current of electricity was sent through a wire passing through an electrical field, the wire would be deflected at a right angle to the current.

Einthoven had no difficulty in constructing a galvanometer fast and sensitive enough to take up the tiny currents thrown off by the heart, and he also produced a gold-plated quartz wire thin and light enough to respond thereto. But the apparatus was so delicate that it was subject to all sorts of electrical counter-influences. In an effort to offset them, the first cardiographs were built on foundations of rock, running down to bed rock. It was thought that surface earth vibrations interfered. When that system failed to work, various inventors devised elaborate structures weighing many tons and containing huge springs from which the apparatus was suspended. The cost was tremendous and the results were uncertain, so that until a few years ago only the wealthy could make use of them.

Charles F. Hindle, of Ossining, New York, who has been known to scientists for many years as a research expert in sound photography and similar abstract work, became interested in the problem several years ago. He is a practical mechanic with a faculty for painstaking electrical detail. After years of experiment he produced the Hindle housing, which has carried the cardiograph into every big city in the country and put it within the reach of the smallest hospital and of every heart specialist. First he built an electromagnet to provide the necessary electrical field, and then provided it with what he calls a compensating resistance box which will adjust electrical currents down to one thousandth part of an ampere. For every possible disturbance of the wire other than that of the action current furnished by the heart, this box provides a compensating or counter current. Even the steady but almost imperceptible flow of electricity produced by the action of sweat glands in the skin of a patient is neutralized by applying current in the opposite direction. When the box is adjusted to meet all existing conditions, the wire is held perfectly still in the center of its electrical field.



The top line is an electro-cardiogram of a diseased heart, the lower one that of a healthy organ.

As an example of how thoroughly accurate the mechanism is, tests were made by one specialist on a trolley car. It was found that compensating currents could be set up to overcome the jolts and vibrations of the car, holding the wire absolutely still. It has been stated that the wire is four ten-thousandths of an inch in diameter. But that does not indicate how thin is the part of it that carries the electrical current. Quartz is a non-conductor. The current produced by the heart passed through the gold plating.

Heretofore heart disease of many and varied kinds have been studied and treated from symptoms. The cardiograph has proved conclusively that these are not reliable. It has shown that a weak heart, organically degenerated, will show exactly the same symptoms that may be obtained, under certain circumstances, from a perfectly healthy organ which is a bit "temperamental." Hearts in the latter class have mystified even the greatest of the experts for centuries. The cardiograph has made it possible to locate them instantly, even though it does not explain their cause.

It is now known that thousands of men and women with perfectly healthy, strong hearts have been rejected by insurance companies and given years of worry through being told that their hearts were weak or diseased. All that is now avoidable. A specialist, who has become one of the leading American authorities on the use of the machine, made detailed investigations of heart action in hospitals where it was sometimes impossible to move the patient. In a number of cases he succeeded in carrying the heart's electrical currents a distance of two city blocks from the bedside of patients in a contagious disease ward to the cardiograph in another building.

"An electrocardiogram," says that specialist, "is the product of a modern graphic method of heart examination by which may be differentiated, accurately diagnosed and thus more intelligently treated, various defects of the cardiac mechanism. The first American papers on electro-cardiography were not written until 1910, but already the subject has passed the stage of experiment in physiologic laboratories and has become of profound significance to the clinician. In discussing the physiology of the heart it was stated that the excitation wave preceding the contraction of the various heart chambers normally takes a definite, established route from the pacemaker, where it originates, to its eventual distribution in muscle fiber, which it then excites to contraction. This route is called the conduction system.

"Now, when disease, or its toxins, interferes with conduction, when disease disturbs either the rhythm or the contracting power of the heart; when it enlarges some chamber or renders certain cardiac areas either too highly responsible or too apathetic to the contraction impulse, the excitation wave will take many devious pathways. By animal experimentation and by clinical experience it has become possible to interpret these deviations in terms of heart affections.

"The record from a healthy dog's heart is quite like the record from a healthy human heart. The difference is negligible. In experiments with the dog the conduction system was interfered with at various points by pressure with forceps; it gave abnormal curves. Records similar to these were found in tracings from human hearts; at necropsy in these cases it was discovered that disease had produced the same changes in the human heart that had been experimentally induced in the dog. Another experiment was to produce enlargement of the various chambers in the animal heart; again was obtained a type of curve which had been observed in human tracings; and again did eventual necropsy establish the truth of the electrocardiogram. It was also demonstrated that when infectious diseases, such as pneumonia, changed the human records it would alter the records in a similarly diseased dog in like manner. Drugs, such as digitalis, atropine, lead, and so on, were administered to canines in the laboratory; the electric curves were modified. The same alterations in the record were found in patients taking these drugs. With such credentials has electro-cardiography introduced itself to the medical profession.

"This method of examination has not only acquainted the physician with heart conditions which were not known to exist before its advent, but it has also confirmed many clinical diagnoses which he has been accustomed to make. For example, it tells which chamber of the heart preponderates in cardiac enlargement. It frequently substantiates the clinical diagnosis of mitral stenosis; it furnishes corroborative written testimony of aortic valvular disease. It guides in the selection of cardiac drugs; it warns of their beginning toxic effects. It not only records the efficiency of chosen methods of treatment, thus often indicating a change of remedies, but it also signals the approach of danger in the overadministration of certain drugs.

"To illustrate, it tells when the cardiac tolerance of digitalis has been reached long before the physiologic limit manifests itself. It heralds, at times, the approach of some diseases which affect the heart—such as acute rheumatic fever—before the clinical evidences of fever, joint swellings, and so forth, make their appearance; and at the further extreme of an illness, graphic records may indicate the approaching end of life long before Cheyne-Stokes respiration and other classical symptoms of dissolution ensue. In addition, the study of an extended series of curves, which have been taken under varying conditions of rest and exercise, may afford written evidence of the functional activity of the heart muscle. Structural myocardial change, which is a diagnosis often difficult of clinical determination, can now be recognized by electro-cardiography.

"Electro-cardiography does more than confirm diagnoses at which one has clinically arrived; it gives minute information concerning irregularities of the heart which are clinically suspected but which cannot be certainly sustained without graphic record. Among these are exaggerated sinus arrhythmias, multiple premature contractions, paroxysmal tachycardia of auricular or ventricular origin, atypical auricular fibrillations, auricular flutter, ventricular flutter and varying grades of heart block. It should be borne in mind that disease changes the normal waves of the electrocardiogram in sequence, in amplitude, in direction and in duration.

"Three curves compose the record; they are the three leads, expressed in Roman numerals. They are called leads because they lead the current from certain surfaces of the heart. Lead I registers the electric potential of that part of the heart which comes nearest to a line drawn from right arm to left arm; lead II, of the line drawn from right arm to left leg; lead III, of a line drawn from left arm to left leg. Insulated wire carries the heart current from the patient to the string galvanometer. The connection of electrodes for the patient are simply pieces of German silver curved to fit the right arm, left arm and left leg, and are held in place with bandages soaked in a twenty per cent hot salt solution.

"Fine horizontal screen lines, called ordinates, are permanently drawn on the lens of the camera and are used to measure the height of the individual waves. The

Consider Alaska

PRESIDENT HARDING'S visit to Alaska should stir the country's serious consideration of the future of that great undeveloped empire. Too long, we have been content to revel in the fiction and pictures of that great northland as a place of snow and ice, of vast distances, of gamblers and gold, of wolves and blizzards.

Alaska is the country's greatest reservoir of untapped wealth. Coal, oil, timber and metals are known to be among its resources. But never has there been a complete survey which would permit the country to contemplate its possession. Unquestionably Alaska possesses water power of inestimable value. The utilization of these properties is alone the question. It is a big question undoubtedly. But then the United States is a vast country, with vast equipment.

It will take years to make Alaska's resources available. Some of the wealth hidden far below the surface of frozen ground may not be reached for centuries. But the difficulty of making use of Alaska's wealth furnishes no excuse for delay in proceeding to the task. Indeed, the very obstacles in the way should inspire the government to greater efforts.

Transportation is a great question. The government railroad in the peninsula should merely whet the country's appetite for the good things of the land. Experts should be engaged at the task of studying other railroad routes, truck routes, the navigability of the rivers. Even the possibility of airplane freight transportation in the near future is not to be neglected.

Other experts should survey Alaska's resources. We should know what the land possesses and we should know how and when we can use it.

The country's thought must be engaged in the consideration of the terms under which the coal, oil, timber and other resources of Alaska are to be used. Destruction and waste should be prevented. Exploitation should be rigidly curbed. For years, the country has heard the cry for conservation of our natural resources. Selfish interests have sought to capitalize that slogan for private purposes. Eastern coal operators, for example, have raised their hands in sanctimonious horror at the suggestion of making Alaskan coal available for the Navy's use. Their real horror was at the thought of the loss of a profitable market. True conservation does not mean that our natural resources must remain forever untouched; it means that they must not be wasted. Coal, oil and similar products are to be used, not to be hoarded. A miser's gold is worth no more than sawdust.

Whether Alaskan resources are to be developed by the government or by private industry is a subject on which opinions will differ. There is time enough to consider the problem from all angles. But there must be no further delay in beginning that study. America has spent much time talking of Europe's troubles. Alaska is our own problem; we should tackle it.

We'll Pick and Choose

IMMIGRATION restriction seems to have become the settled policy of the United States. The voices are well-nigh stilled which demanded raucously wide-open gates for the undesired and undesirables of all nations. Congress will amend the immigration laws. But it will amend them by perfecting the machinery of administration, by correcting details of operation. It is unlikely to change the fundamental concept.

Immigrants we must always have. New blood is a good thing for a country. But it must be blood which can be assimilated. Aliens to become Americans must inherit capacities and mental qualities which will enable them to absorb our conditions of life. Congress seems to have accepted the idea that aliens who enter the country must be sorted and sifted so that the best may be accepted, the poorest refused. It has decided, too, that the immigration stream must be slow enough to permit proper examination of its elements.

There have been two years in which the country has had the opportunity to judge the Dillingham law. The judgment in the main is favorable. Some worthy aliens may have been kept out and some undesirables have got in. But most of the worthy ones who sought admission in good faith and with proper exercise of intelligence have been admitted and are now on the road to American citizenship. And a great many undesirables have been kept out.

The law has been tested in two periods, one of unemployment and one of great production: In both the periods, there have been hordes of parasitic aliens who have attempted to gain access to American wealth. During the past year, when opportunity for industrious persons was presented, there has been a rush of really desirable immigrants. Scandinavian, Dutch, English, Scotch and Irish quotas were exhausted during the year just closed. The quotas of none of these people was approached in the year previous when there was no work to be done. Germans in large numbers emigrated during the past year. In the year 1921-1922 there was little Teutonic immigration.

Persons who enter the country when they can find work to do, and who stay away when their presence should be only a burden, are desirable. Immigrants who come, work or no work, are parasites. The Dillingham law has been proved a fair success in its general purport. But it must be strengthened and its machinery perfected.

It would do no harm if Congress made the 1890 census the basis of determining the number of immigrants from each country. This would cause North European stocks to form a relatively larger part of the alien total. Last year's developments have shown that North Europeans are abundantly able and willing to provide the labor which is necessary to the United States in periods of industrial prosperity.

Congress must take measures to provide a better means of selection of immigrants. Examination at the source is unquestionably the best way of determining each alien's worth, and of minimizing disappointments among those who hope to become Americans and are doomed to rejection. Italy has wisely agreed to co-operate with the United States in limiting Italian immigration to the number and the type this country can accept. The State Department should be able to make similar agreements with other nations.

The first of the month race of steamship companies to get their steerage cargoes to Ellis Island before exhaustion of the quotas is a bad thing. Congress should be able to regulate the problem so that a steady controllable stream of immigration would pass through the ports of entry, permitting the officials adequate time to perform their duties of examination.

Let's Have This Memorial

FLORIDA, a little Missouri town of 500, wants to have a Mark Twain park. Florida is the birthplace of Samuel L. Clemens and is now fired with the great ambition to make his father's ramshackle cabin, recently rescued from the wreckers, the center of a national reserve.

The cabin is just a stone's throw from the Salt River dam which Mark Twain made immortal. All around are the scenes which impressed themselves on his boyhood mind and were afterward described, sometimes magnified or distorted, in his stories. Florida residents hope to preserve these old scenes.

The little village's ambition will be commended. Our country is not very old, but in recent years its penchant for preserving historic places has become pronounced. Mark Twain is one of the world's most beloved figures. He needs no memorial for in Huckleberry Finn and Tom Sawyer his personality will be engraved forever on boyhood's heart. But that his home town should undertake to show its pride in its son is fitting. None will grudge the little Missouri village its park.

Too Much Government

WHEN is somebody going to put a stop to the growth of government? Let your mind dwell a moment on the public offices you know, Federal, State and Municipal. In how many of them do you recall a reduction in personnel?

Jobs have multiplied in all governments. In the United States, the growing tendency toward paternalism has resulted in the creation of commission after commission, of board after board. Many of these institutions are finely inspired. A woman of influence sees a baby under unhealthy conditions: she immediately concludes the state should take over the rearing of the child. A welfare worker discovers a tenement, poorly constructed: the regulation or construction must be done by the governmental agencies or under governmental control. There is a dark street: there must be an extra policeman on the beat. The ice on Wrangel Island is dangerous: there must be another ice-cutter at once. The dogs on Chestnut street are bothered by fleas: the city must employ a flea-catcher.

Most of the ventures of government into channels of activity previously reserved to the individual are undertaken because a few enthusiasts see an impelling public need, while the majority of the taxpayers do not take the trouble to object to increase of public work.

But sometime, someone must halt this increase in governmental activity, this multiplication of employes whom the taxpayers must pay. It can't go on forever, else the logical conclusion, all government and no people, must be reached.

We are not able to say offhand just what governmental experiments are unjustified. But all appreciate the fact that we have too much government. Government is getting so fat that it soon must eat its own fat. Nearly every human activity is affected in some degree by governmental agency. Someone must halt the expansion. Who will do it?

Cuba as Uncle Sam's Ward

THE salvation of Cuba is a subject on which American opinion differs radically. Some self-sufficient Americans have always maintained that the island cannot succeed unless it is annexed to the United States. Some freedom-loving Americans cannot bear the thought that Uncle Sam should attempt in any degree to control the destinies of an independent state. Some matter-of-fact Americans look upon the present situation in Cuba with satisfaction for they feel the United States, having freed Cuba, should see that its little protegee enjoys itself but does not wreck itself.

These differing opinions will not affect judgment of the success or failure of present Cuban affairs. Cuba is being governed with financial efficiency, whether credit be given to President Zayas or Minister Crowder, and whether the relationship between the Cuban treasury and the American money market be praised or condemned.

Perhaps, more than any other country, Cuba felt the sudden decline of war prices. Cuba's great commodity was sugar. When raw sugar fell from twenty-three and one-half to six cents a pound, panic was inevitable. The Cuban treasury was empty, and a large portion of the public debt was due. It was admitted that a joke civil service held many useless employes in their jobs. And it was not denied that venal judges sat on the bench.

Private business has revived in Cuba. Major-General Enoch H. Crowder, acting as representative of the United States, was instrumental in getting 16,000 public employes dismissed and in procuring a law permitting the removal of judges. President Zayas has prosecuted reforms against strong opposition, and has at last a cabinet in accord with his purposes. Mr. Crowder is now minister to the island and still advises the President. During the fiscal year, which closed June 30, revenues amounted to $68,371,000 and expenditures were kept below that figure. Progress has been made in cutting down the debt. Guardianship and wardship are never altogether pleasant relations. But Uncle Sam, in the role of guardian, gives as much thought to his ward's welfare as he does to his own.

Mr. Ford's Page

WHEN you measure the human energy expended in this world and analyze the purposes for which it is used, you discover that about one per cent of all effort is expended for the production of food. Only about one per cent. This does not mean that only one man in a hundred is engaged in farming; the percentage is higher than that; but of the total human energy generated and used, one per cent goes directly to the work of producing food. Even the farmer's energy is not by any means directed solely to raising food. Think of the seasons when it is impossible for him to engage in that work.

Now this fact has a bearing on the notion that it is and naturally should be hard to get a living on this planet. Food is the most vital of our necessities, without which we could not procure clothing or shelter; and yet after the production of all the food which the human race needs, ninety-nine per cent of human energy remains for other uses.

Is it true, then, that the main business of life is getting a living? On the face of it, it is not. And with the coming of power-farming, of course the percentage of human energy required for food production will be less and less.

All the time, without our realizing it, the principal business of life has been something besides merely getting a living. People have won their living, but it has never been the big engrossing work which they have thought it. The real job in life has been getting experience. If there is any meaning to life at all, certainly it is not to be found in the act of feeding ourselves daily. The earth has no need whatever of its human population. We are not a physical essential to this planet. And if merely living in the physical sense is the reason for our presence here, then even that life is not essential to us—because it would not mean anything to rational beings.

It must be, both from the figures and from the philosophy, that the main business of life is at a point above the physical. It must be that the main business is getting something else besides a living. It must be that the "living" is a by-product of some other activity of which perhaps we have been too little aware.

If this were not so then we could not look upon the Coming Era with much hope. There are people, as everyone knows, who teach and preach that the only problems to be solved are the economic problems, of which the sufficient production and distribution of food is the fundamental. Well, we are on the verge of doing that. It will not be a long time, comparatively speaking, before the food supply will be made as secure and full as the water supply, and will occupy the same relative position in our community life. That condition is on the way. Nothing can stop it. The stupidity of letting the kitchen side of life occupy so much of the thought of people is going to force a more intelligent state of affairs.

> *WHEN figures and philosophy agree, we are hitting near the truth. The figures show that in this matter of getting a living about one per cent of human energy is expended on the production of food. And the philosophy of life indicates that our principal business on this planet is the gaining of experience. From these may be deduced the principal objects of life. More mental energy is wasted in Fear concerning our "living" than is actually used in securing a living. There is no comparison between the degrees of physical and mental energy expended in that matter. Living actually comes much easier than we suppose—save for anxiety, fear, pride, jealousy and other wasteful uses of energy. Stopping the leaks in our mental power plants would double the ease of living.*

But what then? With the earth organized and all the present powers at man's disposal brought into play (there is no need for new powers: we have all the requisite tools and methods now), will that be all?

No, the "milling around" of the people, the quests and excursions of the mind, the whole tortuous round by which experience is gained will still go on—for, after all, that is the main business of life, to get experience. If it were merely to get a living, the "milling around" would stop once a "living" was secure. But it will not stop. Rather it will be released to other channels.

Once someone asked a wise Socialistic thinker what he was going to do when his Socialism was firmly established and every economic problem settled and the people had nothing to do but live bovinely, like the cows; and the man replied, "Why, after we get Socialism, we shall probably tip it over and try something else." He was a wise man; he knew that the wrestling human mind has other objects than the getting of a living.

Of course, it is true that while so small a percentage of human energy is actually directed toward the production of food, it is not to be questioned that far too large a proportion of mental energy is devoted to the task of getting it. We should not confuse the *production* with the *getting*. But most of the mental energy thus expended is not productive; indeed, it is just the opposite, it is largely destructive. Take anxiety, worry, jealousy, pride, fear—always there is fear—these are expenditures of mental energy, but they are *not productive*.

If one per cent of the Fear energy could be directed to positive ends today, it would mean something of a revolution in society, it would be a complete revolution in many lives. People are thus expending energy with reference to the matter of a living, without in the slightest degree making that energy count toward the production of a living.

It is a serious waste of energy. The very man who is most guilty of it would not tolerate it anywhere but in himself. If his garden hose leaked, he would mend it to save the pressure for the business end of the hose. If his steam-boiler leaked he would consider himself a fool if he went on forcing up steam that should only be wasted through the leaks—he would repair the boiler that every ounce of steam might deliver all its force where it could accomplish something.

But in the matter of his own mind, his own personal energy, his very highest and most precious energy, he dissipates it thoughtlessly in anxiety, worry and fear—always Fear. He needs to stop the leaks—to compel his mental energy to bring all its pressure to the constructive object, and so accomplish something.

Getting a living is only half as hard—let us say rather, that it is twice as easy—when the full energy of the personality is given to it. When a man is wasting his mental steam in Fear and self-distrust, he has mighty little power left for the main job, and what little he has left labors most wearily. When a man conserves his mental steam, devoting it entirely to what he has at hand—living fully in the minute—then he not only achieves his living easily, but he has a surplus for the real work of life, which is the gaining of experience.

It may be true, it probably is true, that one of the first and best experiences which we get is the mastery of conditions in which we find ourselves. It is easy enough to lie down under them and complain; it is easy enough to say that if the world were different we also should be different; but the world is made better only by those who are able to surmount the conditions in which they find themselves when they awake to intelligent appreciation of their surroundings. If everyone could know that the ladder by which they must climb, if they climb at all, has all its rungs made out of the very things they find hardest, there would be a general upward movement. What we sometimes think is the grudge of life against us is really the nudging of life trying to wake us up. It isn't always easy, it is often hard—but where is the man who will say he has won anything in life without paying the price. It is hard, but hardness pays; it does not breed hardness, it breeds hardihood, and hardihood is the soul's growing up.

Put down the figures, make your own mental analysis, and see if the getting of experience does not take up more of your time and your energy than the getting of a living.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Tribute Paid to Banks to Transfer Realty

"Title and Trust" Companies in Pennsylvania Operate Under Sanction of Law and Their Records Become Basis for All Transactions

By WILLIAM A. M'GARRY

IN THE revelations of how banks profit by the money system which has been imposed on the people of the United States and which is so zealously guarded against attack, nothing has been brought to light so far concerning a phase of banking operations in which those institutions actually take over one of the first functions of government. That is done in nearly every state in the Union, in some form or other, in the handling of real estate transactions, but nowhere has the system been developed to the state of perfection from the banking point of view as has been achieved in Pennsylvania. In that state the sovereign commonwealth has in effect surrendered the beginning and foundation of its sovereignty, the passing of title to land and buildings to the purchaser. The state and the officers of the state still hold the records, but in the great bulk of instances sales are impossible even for cash until the purchaser has paid tribute to the banks.

It is not necessary to be an expert in the history of nations to realize that control of the land is the basis of government. That is true of every form of government evolved in 7,000 years, whether the power comes from the people or by "divine right." Therefore the surrender of that power or of any part of it in effect transfers the governmental right and function of taxation from the whole people to a small selected group, thus setting up a sort of partial super-government taking its special toll from all the necessities of life—food, clothing and shelter, all of which are influenced first and last by the costs of land and the buildings thereon.

How Banks Take Power

THE method by which a small but important part of the taxing power has thus been transferred to banks varies in different parts of the country, in conformity with the different state laws. Generally speaking, however, any bank with the word "title" in its name is in effect an agency of taxation, and none of the sums it collects through that function find their way into local or state treasuries except such portions as are taxed in turn by the state as income. In some states and cities, where the jumble of old-fashioned realty laws makes it particularly easy for such banks to operate, their grip is complete, and one such example is Pennsylvania. That state is dotted with "title and trust" companies doing a general banking business and taking the place of the state in issuing, for cash, guaranties of real estate titles.

Three such banks are in operation in Philadelphia, the largest city in the state. Many other banks in the city issue title insurance, but all of them operate through the three large and wealthy centrally located trust companies where titles are manufactured. Each of those companies owns what is known in real estate circles as a "plant." In reality it is nothing more nor less than a card index system showing the ownership of virtually every piece of property—real estate—in the city and in many surrounding counties. These records are kept up to date by a small force of clerks who get daily reports from the recorder of deeds of the real estate transfers. The final record for each property shows its entire history from the time of the grants of land to William Penn, or the deeds which he and his descendants issued in the sale or distribution of the land within the boundaries of the state.

Issue Title Insurance

ON THE basis of the records so maintained, rather than on the official records kept by the state authority charged with that work, the companies issue what are in reality policies of title insurance. They guarantee to the purchaser a clear title to his property, subject to mortgages and certain restrictions that will be explained later. On the surface that may appear to be an excellent thing, but the fact is in practice that through their control of mortgage funds, real estate dealers and indirectly of building and loan association funds, the banks have succeeded in creating a situation in which the insurance is no longer optional, but compulsory. In other words, a citizen buying a home for which he is unable to pay cash cannot make settlement until he buys title insurance from the bank. If he can pay cash and refuses to supply himself with title insurance, he may have difficulty in selling it. Certainly he cannot raise money by mortgage on the property until he has obtained a title insurance policy. The only alternative to the policy is a search through official records in the office of the recorder of deeds that in the case of a property many times transferred may be long and expensive.

Here again it is seemingly apparent that the trust company renders a service of value to the purchaser. But the point is that the service is given at the expense of the whole people. The fact that the taxing power is considered of inestimable value is shown by the opposition raised by the banks and others that stand to profit by it whenever a proposition is put forward to have the state give this service; in other words, to guarantee its own deeds. In the last analysis that is where the real guaranty comes from. All titles are based on original grants or sales by the people or their representatives constituting the government. Only the use of an ancient and outworn system of recording makes possible the existence of the title insurance company.

One result of the existing system in times of real estate booms is to delay settlement on properties for as much as four months, due to the congestion in the three trust companies. Real estate speculators evade the title insurance payment by doing business, as a rule, on options or agreements of sale. Sometimes in boom periods a property will be "turned over" three or four times in a week, the ultimate buyer who wants it for a home being required to pay for the title insurance. When the settlement is made the trust company acts as a clearing house between buyer and seller, a function that enables it to exercise its control by refusing to approve settlement until title insurance has been obtained.

Dealers and Bankers Know

THAT evil is only one reason why various economists have condemned the "own your home" movement which first swept the country during war years, but is now revived every spring. Admitting that it is a desirable thing under certain conditions for a workingman to own his home, experts who have analyzed the propaganda in that direction and the reasons for it have found that the uninitiated purchaser is subjected to a multiplicity of costs for which the banks and the real estate dealers are responsible. A great deal of advertising is done to show how each takes care of its "clients" but the records prove that as demand increases, instead of being satisfied with normal profits, the rate and number of commissions have also increased. **In thousands of cases the bankers and the real estate dealers know when a workman buys a home that he will not be able to hold it because the carrying charges are beyond his earning ability. Instead of warning him, however, and finding a property within his means, many of them take the view that his purchase insures another later sale and thus more commissions.**

Housing laws in some states have given partial relief to wage earners from the operations of gouging landlords and have even furnished some protection against the effort to multiply costs and commissions. Nothing of that character has been done in Pennsylvania, however. In that state title insurance is only one item in many costs, connected with the purchase of a property, saddled on the buyer. An explanation of the details surrounding such real estate transactions may be of value to workers in all parts of the country, even though the laws differ in some respect. As a rule the differences are in name or title only and the same organizations operate everywhere.

What He May Expect

A WAGE earner buying a home under the plan generally in use may invest anywhere from a few hundred to a few thousand dollars, borrowing the remainder of the purchase price on mortgages. Usually first mortgages are limited to 50 per cent of the purchase price. If the worker has not enough funds to care for the other 50 per cent he obtains a second mortgage through what is known in Pennsylvania as a building and loan association, or its equivalent in other states. That is supposed to be a strictly mutual organization. It furnishes installment loans, payable six per cent a year. The total payment is 12 per cent, since there is also an interest charge of six per cent. In Pennsylvania that figure for interest is fixed by law, as in some other states. But nearly all the associations, through manipulation by real estate dealers, get around that by charging a "premium" which increases the interest rate to seven per cent or a trifle more.

If the buyer happens to know the ropes, if he has held stock in a building and loan association, or two of them, he can save himself a great deal of money in commissions. Most purchasers of small homes enticed by the "own your home" campaigns and propaganda are wholly ignorant of the details. They make arrangements with the real estate dealer for the amount of cash required and the amount that may be obtained on mortgages. In the case of a property that has been occupied it is quite likely that a first mortgage is already placed and the life of it may be anywhere from three to five years. But before making that plain to the purchaser the real estate dealer will attempt to get a commission for "placing" the mortgage. Whether or not he is successful there he will ask for a commission also for getting the second, or building and loan mortgage. The commissions range from two to five per cent.

When the day of settlement arrives the purchaser finds that he is required to pay for title insurance, fire insurance to cover the amount of the first mortgage and another policy to cover the second, conveyancing, a solicitor's fee of $25 to $50 to the attorney for the building and loan association, and perhaps an extra fee to the real estate man for representing him. It is possible if he is familiar with transactions of that nature and happens to have a real estate friend that he can get the fire insurance policies transferred to him. As a matter of fact there is no reason why the same method should not be followed with respect to the title policy, and the second mortgage, without all the extra costs and commissions, on payment of a nominal fee. To the outsider it would appear to be good business for the real estate dealer to make home buying less expensive, since he always profits at the outset of the deal by the commission for making the sale paid to him by the seller, and ranging from two to five per cent on the total sale price.

It has been stated that the building and loan associations and their equivalents are by law mutual organizations. The facts outlined show only partly how they have been manipulated by real estate dealers. One Jewish realty speculator in Philadelphia is said to control 24 building and loan associations. He or his agents are the conveyancers for each of the organizations, and the solicitor or legal adviser is also either in his employ or co-operating with him. Thus while there is a board of directors, in many cases, it is declared, everything is left to the experts, without the board inquiring as to whether the conveyancer is getting a commission from the home buyer who applies for a loan and to whom a loan is issued on stock or property security. If a dealer wants to speculate he merely invents a name, or has a clerk or agent appear as the purchaser.

A Study of Building Costs

IN A rising real estate market a dealer is often able to "buy" property to be held for resale at inflated value, without the investment of any real money except for short periods. He may make a payment of a few hundred dollars when the agreement of sale is made. If he fails to sell at once at a good profit, he takes title through a "straw man" at a manipulated and inflated price. In other words, he can make it appear that he has paid say 20 per cent more for the property than he is actually paying. That makes it possible to get a higher loan from the building and loan association, so that not infrequently he borrows as much as he is paying for the house. In fact there are instances in which the manipulating realty dealer borrows more on mortgages than the purchase price and pockets the difference as immediate profit. The existence of so much in mortgages is then used as proof that the property has a much higher value, since the general conservative practice is to keep the total of second and first mortgages within 80 per cent of the total value.

Some years ago a study of building costs was made by housing experts in Philadelphia. It developed that fully 25 per cent of the purchase price of the average two-story individual home, for which the city is famous, represented various forms of banking costs. In recent years evidence has accumulated indicating that the percentage has shown a marked increase. For example, when the war boom ended there were more than two thousand new dwellings in Philadelphia, built by speculators on funds furnished by the banks, some of which remained idle and unsold for nearly two years in the effort to hold up inflated valuations. Houses built at a total cost of $7,000 to sell at $8,500 were held at $11,000. The familiar type of workers' home selling before the war for $2,500 to $4,000 disappeared. It doubled in price. It is double in price today, although costs are far below what they were in the boom period. *One builder of homes in Philadelphia who refused to inflate values,* and whose dwellings sold on an average of $2,000 below the prices asked for substantially the same type home, *was put out of the Operative Builders' Association.*

Sell at Inflated Prices

THE foregoing is of particular importance to the workingman who is contemplating the purchase of a home at this time, since another movement toward price inflation is well under way in the construction industries. Warnings were issued at Washington against just such a movement a few weeks ago. All over the country operative builders are putting up homes, in many instances using discarded or salvaged war material, asking profits that in some cases run up to one hundred per cent of the actual cost. The banks financing those operations, of course, stand to get a major share of the profits in one way or another. Some workers are evading those costs by a careful study of market conditions and by building their own homes, or having them built on a day labor basis. Mortgage funds can be found without the services of real estate men when the latter demand exorbitant commissions.

In various parts of the country real estate operators are selling at inflated prices houses built for the government during war times. Often the man now selling the houses was the builder or his agent. He sold them to the government in the first place for $5,000 or $6,000 each, and more, making a handsome profit. Then he bought them back, singly, in blocks or by auction, at perhaps $2,500 each. Now he is offering them for sale at $6,000 and up. In some sections every possible legal technicality has been utilized to dispossess individual buyers who live in the homes and are attempting to buy them on the installment plan.

What Horticulture Offers to Young Men

Compensation for Lack of Great Wealth Comes in Freedom of Action

Greenhouse work is pleasant.

Setting out cucumber plants.

By E. I. FARRINGTON

IT IS possible to get rich in some branches of horticulture, but not very rich. Most men who become horticulturists are content with a comfortable living. They find compensations for the lack of great wealth in freedom of action, absence of routine and the opportunities offered for an open-air life.

People have a somewhat vague idea as to what horticulture means, anyway. It rubs elbows with agriculture, but it is not farming in the broad sense, because farming embraces both animal husbandry and the growing of grains. Horticulture may mean raising apples in Oregon or pineapples in Louisiana; it may mean operating a market garden in New England or caring for a citrus grove in California. Horticulture includes the nurseryman, whether his acres be covered with baby fruit trees for the farmer, rare evergreens for the landscape gardener, or old-fashioned flowers for the suburban back yard. The man who raises fifty acres of gladioli or dahlias is a horticulturist, and so is the man with the lean-to greenhouse. When a boy, therefore, decides that he is going to take up horticulture as a life work, he must make another decision as to what particular branch he prefers.

Perhaps no phase of horticultural work takes a stronger hold on the imagination than fruit growing. Who of us has not, at some time in his life, indulged fond dreams of an apple orchard which should provide insurance against his declining years? In most cases there has been a rude awakening when investigation has revealed the difficulties and expenses incident to the bringing of such an orchard into bearing. Much money has been made and lost in fruit growing. Yet fruit growing at its best offers a life work of a most attractive nature. There are a few extensive orchard concerns which have made good. but for the most part fruit raising is an individual undertaking, although cooperation in marketing as well as in the spraying and general care of orchards has become common.

Few people realize the detail involved in the growing and selling of fruit. Years of study and practice are required to make a genuine orchardist. One must needs be something of a chemist to understand the theory and practice of spraying, for many kinds of poison are used in different seasons and in different ways. To be a successful orchardist one must understand all about the habits of trees, so that he can prune and fertilize them intelligently. No two varieties are exactly alike in their requirements.

To make money at fruit growing one must be able to market his product to advantage after he has grown it, and to do this he must understand the art of packing, sorting and cooling, as well as be able to strike a good bargain.

Finally, although this really comes first, the man going into fruit growing for a living must understand locations and soils, for elevation, proximity to water, air currents and rainfall all enter into the problem.

It is well to have some capital. If a new orchard is being started it will be necessary to wait for from five to ten years, depending upon the variety, before any profit is returned, although meantime the land between the trees may be used for growing other crops which will help to pay the expenses, and perhaps a little more. Good apple orchards bring a high price, and with reason. There are men in the Shenandoah Valley, in Virginia, who are said to net from $10,000 to $20,000 a year from their pippin trees.

There are plenty of farmers in New York State and in Oregon, as well as in parts of Canada, who get a splendid living from apple growing. It is a common thing for Alfred A. Marshall, of Fitchburg, Massachusetts, to sell his early apples for four dollars a bushel box, but they are packed by experts and carried to the city in big trucks for prompt disposal. Mr. Marshall was formerly a traveling salesman, and started his farming by raising strawberries and peaches. One night, however, a frost swooped down on the village and in the morning Mr. Marshall had seven thousand dead trees. Then he went into apple growing and has made a fortune. His experience is mentioned because it is somewhat typical of many others, where brains have been liberally mixed with brawn.

Apples constitute the big fruit crop, apart from citrus fruits, and yet fortunes have been made and lost in peaches. Peaches are a gamble at best, being dependent to a remarkable degree upon weather conditions. Still, one good crop in three years may make a peach orchard worth while. For years J. H. Hale, of Glastonbury, Connecticut, was known as the peach king. When but a mere boy he staked everything he had on peach trees, including a big mortgage on the family homestead. He planted peach trees in season and out, in spite of criticism and sarcasm. He made much money in peaches, and his son is following in his footsteps. Mr. Hale, however, was a business man all the way through, and peach growing requires a business head to prove successful. While many men are making money out of peaches, they are meanwhile setting out apple orchards to take care of them when the peaches fail.

The growing of citrus fruits, whether in California or Florida, is a specialized industry. The California growers depend for their prosperity largely on their well perfected organization. The industry is localized, and while alluring prospectuses and other well prepared baits are freely offered by western speculators, no man, young or old, should seek an opening in the citrus business until he has made a most careful investigation.

It is much easier to get into market gardening than into fruit growing on a large scale, although the work may not be quite so tempting. There always seems to be more pleasure in picking money off a tree than digging it out of the ground. Yet the market gardener and the truck grower often amass very satisfactory fortunes, and are able to enjoy life reasonably well as they go along. The market gardener is the man who does business close to the city in a very intensive fashion. The trucker may grow similar crops, but has a larger acreage and is located farther from town. As a matter of fact, the distinction between the two is fast passing away, now that the gasoline truck has removed distance limits.

Vegetable growers work hard, as a rule. Some raise almost a thousand dollars' worth of produce on a single acre. There are market gardeners who do a business of from $75,000 to $150,000 a year. Tons

Ignoring Facts Can't Comfort Gold Traders

All Currency Legislation Is Designed to Aid International Bankers

By W. H. ALLEN

ABOUT all the currency legislation of the last thirty years has been favorable to the interests of international or foreign bankers. This applies to the repeal of the Sherman Law, 1893, the Gold Standard Law, 1900, the Emergency Currency Act, 1908, and the Federal Reserve Act, 1913. These laws were obtained by a perversion of the facts, and by warnings of the terrible calamities that would follow the failure to adopt the changes recommended.

From present indications, the organized bankers' campaign of education against what they call printing press theories of money is to be carried out along the same lines. Thus in his plea for a "Sound Money Policy," John H. Puelicher, president of the American Bankers' Association, says:

"Within these various aspects of our economic life there is ample promise of increasing prosperity. But that promise can be defeated by unsound money and credit policies, and by destroying the safe, efficient operations of banking through interfering with the Federal Reserve System by misrepresentations."

This sort of argument, thoroughly sound in what it says but not in what it means, will be liberally used during the next two years. If there happens to be a financial depression—or business troubles, it will be charged upon alleged opponents of the gold standard. But if, as financiers claim, the world owes us more than $20,000,000,000, and if all the gold now in the country is really American-owned, it follows that any attack on the gold standard would be futile. Hence it is only necessary to prove that we are thus fortunate in order to repel such attacks. But the bankers have never even tried to furnish such proof. Furthermore, I have good reason to believe that they would oppose any thorough investigation of the facts. During the past fourteen years I had a number of resolutions offered in Congress on this subject. The first one was sent to Hon. W. M. Calder with the following result:

"I have your letter of March 19, requesting information as to the bill introduced by me last year, in relation to calling upon the Secretary of the Treasury to appoint a commission to ascertain what becomes of our foreign trade balances. I have talked with some of the officials of the Treasury Department, regarding this matter, and *I am of the opinion that they would be opposed to the passage of the measure as unnecessary.*"

"Unnecessary" a Year Later

NOW why should Treasury officials oppose such an investigation as unnecessary? We had just experienced the worst money panic in our history. The trouble was not due to crop failures, or industrial decline. *It was entirely due to the recall of loans by foreign bankers.* As the *Wall Street Journal* said at the time: "Foreign exchange was the crux." Every great panic in our history was preceded by the foreign demand for gold, and that of 1907 was no exception. Besides, the emergency currency bill was before Congress at that time, and hence it would seem absolutely necessary to get exact information about the causes which influence the movements of gold. Before a physician can prescribe for a case he must make a diagnosis. In this case a diagnosis would mean taking account of stock to ascertain the assets and liabilities. Every assignee of a bankrupt concern adopts this method. And so do the more advanced governments of Europe. They ascertain not only the imports and exports of goods, but also the income due from investments abroad and the sums earned by foreign investors and laborers. But, strange to say, our government has never seen fit to follow this custom, and the foreign bankers have always had influence enough with Treasury officials at Washington to throw cold water on any effort to get at the facts. Commenting on the importance of knowing whether we owed Europe or Europe owed us, the *Wall Street Journal,* February, 1907, says:

"Who can answer these questions? Why should it be necessary to ask them at all? Why should so essential a matter as that of the international balance of trade be involved in obscurity? This is one of the most important factors in the money market situation, and yet a dozen different answers could be given to the question. This very week a leading official of the Treasury was asked whether the United States was in debt to Europe or not, and he replied that he did not know. Think of it, the Treasury Department in ignorance of so essential a matter."

And yet a year later, when the great panic had passed, and we were considering plans to recover from it and to prevent its recurrence, our Treasury officials told Mr. Calder that they would oppose my resolution of investigation as being "unnecessary."

My latest effort to get at the truth of this matter was submitted to L. T. McFadden, Chairman of the House Committee on Banking and Currency, who notified me that the information could be obtained by applying to the Treasury Department. A letter addressed to that department brought from Assistant Secretary Wadsworth a reply which was, in substance, as follows:

"Point number one on which you desire information is: The amount of foreign capital invested in our securities and properties. As to this, various estimates have been made but none of any recent date that I have seen. I think it is generally admitted that there is no way in which definite data can be obtained because of the great diversity in the form of investment, such as bonds, stocks, and mortgages of which the ownership cannot be determined.

"Point number two, as to American capital invested abroad. This is also impossible to determine because of the very large number of investments which are made by private individuals in internal loans of foreign nations and cities, also in the bonds and stocks of corporations. There appears to be no way of obtaining any report as to such private holdings.

"Point number three. There appears to be no way of determining the number of dollars that may be owed to foreign bankers, foreign capitalists, or foreign laborers temporarily residing in the United States."

This is the net result of a twenty years' quest for definite information about the international account. Our officials don't know anything about it, and they don't know where to begin to look for the information.

But, if our officials are thus short on facts, they are long on faith. They have an abiding faith in any theory or story that comes out of Wall Street. Like a certain people that Mark Twain tells about, "they don't know much but they believe a good deal." Mr. D. R. Crissenger, Controller of the Currency, is one of these trustful souls. In a recent statement, taking his cue from Wall Street, he claims that we have $21,750,000,000 invested in foreign loans. Besides this, we have more gold than we need. We have so much that it is a source of danger, and to insure our business safety and promote world-wide prosperity, we should lend millions of the yellow metal to poverty-stricken Europe.

Germany Got the Interest

THESE huge loans, already advanced to Europe, represent the amounts which were owed to us in settlement of our enormous exports of merchandise. On turning to Mr. Crissinger's report for 1922 it is seen that during the eight years and eight months ending August 31, 1922, our total net exports of merchandise amounted to $21,995,000,000. Three billion of this amount is supposed to have gone to buy back American securities from foreign investors. But, as I stated in a former article, there is absolutely no proof whatever of such liquidation. On the contrary, there is more proof of an increase in foreign holdings of our stocks and properties in this period. Foreign bankers like Morgan; Kuhn, Loeb & Company, and others, are certainly more active in this market than they were before 1914. Again our pre-war debt, as represented by these foreign investments, was fully $17,000,000,000, not $3,000,000,000 as Mr. Crissinger has it. Furthermore, his statement takes no account of our debts contracted abroad during the war, and our invisible debts for alien hoards, interest dues and similar items, which, as I have showed, totaled $10,000,000,000.

Here the question arises: If these invisible debts nearly offset our trade balances, where did we get the money or foreign credits to make all these loans, amounting to $10 000,000,000, or $12,000,000,000, since January, 1919? Well, we made pretty much the same sort of loans before 1914 when these invisible debts exceeded our trade balances, according to various estimates, by from $500,000,000 to $1,400,000,000 a year. In most cases the foreign bonds were bought by foreign bankers with money which they had received here in settlement of these debts. If, for example, the debts exceeded our balances by $500,000,000, foreign bankers would have credits here for that amount, and instead of taking our gold they might reinvest it in our stocks or bonds or in foreign loans. In 1904 Kuhn, Loeb & Company invested $200,000 000 in Japanese bonds. The deal was much exploited at the time as an American loan to Japan, but in 1915 it came out that *the interest on the bonds was being paid in Germany.* The money which Germany put into the bonds was part of the earnings on her investments in the American market. Not a dollar of the interest on these bonds was ever received by American capitalists.

Not American Capital

THIS is the true explanation of nearly all the foreign bonds floated before 1914. About all the English and German bonds floated were bought with credits earned by English and German investors in our stocks. Proof of this is seen in the return of the bonds to the countries that issued them. Thus the *Bankers Magazine,* April, 1915, says:

"Heretofore, while foreign bonds have been taken in New York, they were believed to be chiefly for foreign account, and perhaps the title to the bonds did not long remain here, and the bonds themselves never, except in rare instances, migrated to the United States." And yet during the preceding fifteen years every financial writer in New York had been exploiting these deals as investments of real American capital just as Jacob H. Schiff had in 1904 exploited the Japanese bonds as an investment of American capital.

When the Italian bonds came here in 1917 the bankers reported that the subscribers were prosperous Italians in New York who come and go every few years. Naturally they were putting their hoards in bonds of their own country. Nevertheless, the floating of the bonds here is held up as an investment of genuine American capital in spite of the fact that most of the bonds are now in Italy.

During the war our dollar was at a discount of from twenty-five to forty-five per cent in the neutral countries, and we had to borrow from them to pay for army supplies. After the war all these countries floated bonds here. Why? Not because they were poor. Switzerland has the lowest bank rate in the world, and her banks are fairly glutted with gold. Yet she sold bonds here in 1919, 1920 and 1921. Holland is the next richest country in the world. Yet she, too, floated a bond issue of fifty million guilders on July 11, 1922. On that same day the *Times* reported that "England, France and Amsterdam were making heavy investments in our railroad stocks, Amsterdam according to reports being a particularly important factor in the present railroad share market." Canada has also floated half a dozen loans here since 1914. And yet there has not been a week in this entire period when British Canadian banks have not had from $75,000,000 to $200,000,000 invested in call loans at New York.

These countries sent the bonds to their bankers in this country, and the bankers paid for them with funds received from our banks in settlement of amounts which we borrowed from these countries during the war, and yet we pose as a creditor nation! About January 26 of this year it was reported that many of the Canadian bonds floated here were finding their way back to Canada, and a week later it was reported that the Dutch bonds floated here last July were going back to Holland. It is a repetition of practically all the foreign transactions before the war. They all go back. This trick of paying a debt and calling it a loan serves its purpose, however. We get the glory. It helps the stock market and the people are satisfied that we are the financial saviors of the world.

There are some of these transactions in foreign bonds and currencies that might properly be described as just plain swindling, helpful to Europe, no doubt, but dangerous to us. When a bank official exchanges his depositors' funds for German marks, for instance, he gets a rake-off and the seller gets a big commission. But it is quite certain that the depositors will never get their money back. Of the sixty billion marks issued since 1918 valued at $2,000,000,000, fully one-half, thirty billion, have been sold in this country. How many more foreign currencies and bonds have been sold to our banks is not known, *but we will get some clearer idea of it when the next panic hits the country.*

It is always assumed that it is our big trade balances which give us the surplus to invest in foreign loans and enterprises. But this is a false assumption. There were, as I have shown, vast amounts in foreign bonds floated here between 1900 and 1914; and yet there was not one year in that period when we had a surplus. Not one year when our invisible debts did not exceed our trade balances. During the fiscal year ended July 1, 1922, our loans abroad aggregated $1,000,000,000, and yet, according to Secretary Hoover, these invisible debts exceeded our trade balance of $1,103,000,000 by $750,000,000. Query: Where did we get that $1,000,000,000 to lend abroad? What plainer proof than this could there be that it is not American-owned capital that is going into these foreign loans? If Mr. Hoover can offer any more reasonable explanation of this paradoxical situation in 1922, when we piled up a deficit of $750,000,000 and yet were still able to lend $1,000,000,000 to foreigners, he should do so at once. It is another one of the paradoxes which those who claim that we are a great creditor nation will have to explain.

A Job on Their Hands

PRESIDENT PUELICHER, of the Bankers' Association, and Controller Crissinger have taken the gold standard and the Federal Reserve System under their wings and will defend both against all opponents. In this move they will be assisted by the several bankers' clubs organized in New York and Chicago, led by Frank A. Vanderlip, Milton Trayler, Paul M. Warburg, Rudolph Kecht, Lindly Garrison, S. Stanwood Mencken, Otto Kahn, Paul D. Cravath, and other lights of the financial world, who have started this campaign of education against "printing press theories of money."

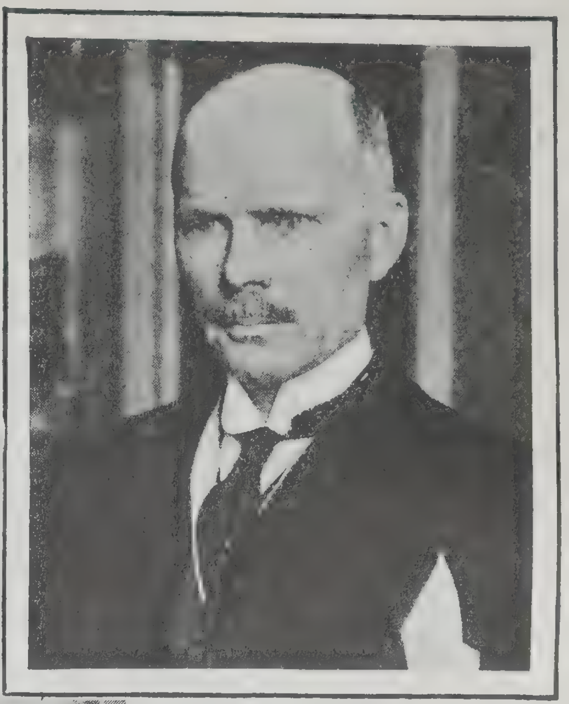
We have been told that this bankers' club would discuss the question from every standpoint. But thus far the campaign has been one brilliant burst of silence on the main issue, the gold standard, and much sidestepping and evasion on other important issues. If the estimates of the international money situation as set forth in these several articles is anywhere near correct (and they have never been publicly disputed), then the gold standard as it exists and operates in the United States, is both a fiction and a fake.

Mr. Mencken informs us that his party will give the people all the facts. But in this question of the single standard the crucial facts relate to *our ownership of gold,* and *our ability to pay gold* on demand without borrowing from foreign countries. In these articles I have discussed this question from every standpoint. But thus far the Mencken party has never discussed it at all. They have never even attempted to confute my view of gold ownership. Neither have they discussed my assertion that our pre-war debt was $17,000 000 000, not $3,000,000,000, as they claim, and that these invisible debts were a big factor in the international account during the war and since. In short, our financial educators have completely ignored the most important facts relating to the gold standard. But this policy of evasion and suppression will not avail. The facts here mentioned go to the root of the whole matter, and they will have to be publicly discussed. Mr. Hoover's statement (for which he deserves credit) that these invisible debts piled up a deficit of $750,000,000 against us is the first admission from a government official that such debts are still a big factor in the international account. The Mencken party will carefully sidestep this portentous fact; but those who want the whole truth will drag it out into the limelight and exploit its significance; for it concerns the main question involved in this campaign as to whether we can or cannot maintain the gold standard. International debts are settled in gold, and if we are running behind $750,000,000 a year we cannot maintain the gold standard long without borrowing.

Dryden Has Real Story to Tell

Home Village of General Squier Forgets Military Achievements in Pride of His Love for Native Heath

By GEORGE H. DACY



(C) Int. F. S.

GEN. GEORGE B. SQUIER.

The attractive little boathouse accommodates one canoe and two rowboats which give great pleasure to the country folk.

IF YOU are interested in wireless telephony or telegraphy, radiography or any of the other short-cut methods of modern communication, you probably have heard of General George B. Squier, chief officer of the United States Signal Corps and originator and inventor of many important radio methods and appliances. He it was who developed the system of long-distance conversation so that a couple of dozen persons can communicate over a single copper wire simultaneously. He was the first to find out that a growing tree could be used as a natural receiving station for radio messages by driving a nail in the tree top and attaching a wireless telephone to it.

Recently, General Squier has perfected an apparatus which puts secrecy into telephoning. By the use of this device, bankers or business men can talk intimate business secrets over a party line and no other person can listen in on their conversation. At least a dozen other important communication facilities are the products of this prominent military leader.

Out around Dryden, Michigan, a little village of 300 persons, which was the birthplace of General Squier, the countryside reveres and venerates its most popular son, not so much because of his military achievements and contributions to the science of modern communication, but because he has been responsible for the conversion of his home hamlet from a hidebound village that was a hotbed of petty jealousies into a peaceful, contented, progressive and satisfied community.

A few years ago, Dryden was a counterpart of thousands of other little rural communities throughout Michigan, Iowa, Illinois, Indiana, Missouri and wherenot over the country. The residents were all stalled in the deep ruts of hamlet retrogression. The only bond they had in common was that of envy and jealousy. The village and its inhabitants were slowly rusting away. Most of them were retired farmers, neither rich nor poor, but blessed with enough of the world's goods so that they did not have to work much any more. Any one who has spent much time in the country communities can immediately recall a number of places which would easily qualify under this description as another Dryden.

General Squier was attached to his native heath. He used to go back to Michigan to visit whenever he had the chance. He kept in touch with local doings. When the village children outgrew the local school—the schoolhouse would have put the average sardine can to shame, it was so crowded—General Squier donated the funds for the construction of a new primary school. Five years ago, he purchased the old mill site of 40 acres, which had long been a community eyesore and dumping place for tin cans, refuse and litter. He had the place cleaned up and renovated. Then he built an attractive bungalow on the tract and soon the villagers who had been gossiping about how the general had purchased a white elephant when he paid $900 for the mill site began to change their tunes and admit that maybe their neighbor had not made such a mistake after all.

General Squier realized so much pleasure out of his pretty little estate that he wanted to share it with the Drydenites. Finally he conceived the idea of organizing the first farmer's country club in the United States. He decided to build an attractive clubhouse as well as a four-hole golf course, two tennis courts, a baseball field and a basket ball court. The old mill stream was large enough for canoeing, bathing and boating, so he added a boathouse to his list of buildings. Altogether, he spent about $7,000 in improving the 40-acre tract. When the buildings were completed, the first thing General Squier did was to throw away the keys. Then he gave the use of the curious country club free of charge to the countryside as a community center where dances, card parties, sociables, educational meetings, entertainments and athletic contests could be held. The only stipulation was that each party that used the club must leave it in as good condition as they found it. It was the first honor system golf and country club in the country. From the outset, it has been one of the most successful community centers ever established in the Wolverine State.

The clubhouse is 60 by 100 feet, with kitchen and dining facilities so that 100 persons can be served at a time. Two sides of the porch are screened and provide ideal quarters for afternoon parties. The clubhouse has a fine floor for dancing, and it can be used as an auditorium for agricultural meetings or entertainments. It was equipped with a secondhand piano, while one canoe and two rowboats were purchased and stored in the boathouse. The grounds of the country club provide ideal spots for picnics. The place was replete in all sorts of amusement facilities. Shortly it was the pride of the county.

Persons from a radius of 50 miles came to enjoy its good cheer and hospitality. To keep the club in spick-and-span order is their pride. They gain the maximum of pleasure and enjoyment from the project and still maintain it in the best possible condition. Bickerings, petty jealousies and neighborhood controversies have been forgotten. All the Drydenites and the neighboring country people now have a common possession which knits them together.

Every Saturday night during the summer months a dancing party is given at the farmer's country club. Everybody who conducts himself properly is welcome. The dance is a melting pot where the hired man dances with the farmer's daughter. Formerly the young people of Dryden used to drift to Detroit or questionable country dance halls in adjoining sections to seek pleasure. Now they all stay at home and have a better time than they ever enjoyed abroad. As many fathers and mothers are present on the dance floors as sons and daughters at these neighborhood hops. No undesirable characters attend the Dryden dances. They know they are not wanted.

The retired farmers of Dryden who looked as though they had one foot in the grave a few years back are now as agile and spry as their children. They have fallen victims to the goddess golf. Any summer afternoon, one may see them swinging driver or midiron with the same lithe movement with which they formerly were accustomed to sink an ax into a block of pine or oak. These farmers who were wasting away because of lack of regular exercise are now rounding into good physical condition again. Golf and tennis and swimming and boating are the reasons.

If you do not believe that the Dryden Country Club is a big success, you ought to visit the place some summer afternoon. You will see anywhere from 50 to 100 automobiles parked at the rear of the clubhouse. You will run into a picnic in the grove, a card party on the side porch, several exciting tennis matches on the courts near the clubhouse and a catch-as-catch-can golf tournament on the miniature links. You will see more happy and contented farmer folk than you ever dreamed could exist in a single rural community. You will meet more home boosters than you ever previously saw together at one time. General Squier's novel system of saving his home community from itself is one of the most interesting examples of village salvage which has ever been recorded.

Not a single article has been stolen from the Dryden Country Club since its inception five years ago, despite that the doors to the clubhouse have never been bolted. The countryside has felt honor-bound to keep the grounds and buildings in apple-pie order. It is quite likely that a coat of tar and feathers and a free ride on a rail would be the punishment of any transgressor who desecrated any of the club property or violated its unwritten commandments. It has developed into the hub and bulwark of the neighborhood for miles around. It has served as tonic to a tired, discontented people. It has operated for the reincarnation of a community which was formerly as sluggish and phlegmatic as any rural hamlet could be.

A visitor who saw Dryden as it was 10 years ago and as it is today would declare that a miracle had been worked. Not only have the people changed, but the countryside has also benefited from the uplift activities engineered by the farmer's country club. Farm homes that used to look as dreary and dismal as abandoned dwellings are now dolled up with fresh paint. Farmsteads which used to look unsightly now appear attractive, with neat flower beds and ornamental plantings as their principal adornment. Roads which formerly were almost impassable at certain times during the year are now in good condition. The schools are in better shape than ever previously, while more of the farmer's sons and daughters are attending college. And all because General Squier played amateur philanthropist to his home community. His unique gift has been worth hundreds of thousands of dollars to the inhabitants of Dryden. It has restored their confidence in themselves; it has incubated interest where there was no interest; it has substituted community content for previous dissatisfaction, and it is one of the best examples in creation for other American villages to follow in fortifying themselves against domestic decay and internal corruption.

A forum of farmers which meets regularly at the Dryden clubhouse to discuss local agricultural problems and to listen to illustrated lectures on farms and farming by experts is the latest development. The meetings are informal round-table discussions of neighborhood soil and crop riddles. They are patterned after the "get together" meetings of the United States Signal Corps, concerning which General Squier had talked to some of his Michigan friends. Certain farmers are designated to read on certain topics and interpret the facts in terms of local conditions. Afterward there is a general discussion. The system of self-service recreation that General Squier has sponsored is a monument to his honor and glory.

Publicity Blah Should Win German Snicker

Lasker's Press-agent Booklet Telling "All About" Leviathan Doesn't Do It

By A. R. PINCI

> "My God, if I thought there was a DEARBORN INDEPENDENT man on board, I would feel like sinking the ship. Of course, I wouldn't sink it, but I would feel like it."—Albert D. Lasker, with both hands in the air.

WHILE the *Leviathan* was speeding southward on its peculiar personally conducted trial trip—the second trial trip in its career—the *Majestic* was speeding westward on its thirty-fourth passenger-carrying run. The *Majestic* bettered its own previous short-distance speed record and established the record of 29.7 knots in one hour; the *Leviathan* broke all previously established records for "sustained speed," covering a distance of 687 knots.

The *Leviathan* is the queen ship of the American merchant marine, owned by the government and allocated to the United States Lines, one of the managing operating companies for the Shipping Board. The *Majestic* is the queen ship of the British merchant marine, allocated to the White Star Line, a subsidiary of the International Mercantile Marine Company.

It was inevitable that, between two modern steamers of approximate size and power but of different nationality, a record should be sought and established; a world record for size, speed and equipment, but the mere fact that both vessels are engaged in the New York-Cherbourg-Southampton service—the shortest among the most popular and fashionable transatlantic runs—presupposes the keenest competition and rivalry.

Publicity is a great asset in the shipping business, and no race-horse owner, jockey or bookmaker studies the performance of the track's champions more assiduously than the traveling or business world observes transoceanic ship performances. But the parallel commercial basis upon which the *Leviathan* and *Majestic* are operating has led to a press-agenting absurdity which is all the more remarkable because it has been begun and sponsored by a professional publicity expert.

When A. D. Lasker, late chairman of the United States Shipping Board, began to press-agent the *Leviathan,* he forced the British company to play up the *Majestic's* own records, but the pretty joke about the whole thing is that *both gigantic record-breakers are German steamers; German designed and German built,* as is the *Berengaria*, the next largest ship.

The *Leviathan* was the *Vaterland;* the *Majestic* was the *Bismarck;* the *Berengaria* was the *Imperator.*

At final analysis, therefore, all American praise bestowed upon the *Leviathan* and all British praise bestowed upon the *Majestic* in establishing size, speed and luxury records—and it will be nip and tuck between them indefinitely—is deserved by the German marine engineers and shipbuilders who wrought these marvelous mechanical monsters in their race for maritime supremacy. Historians are now beginning to discover that there was more concentrated war cause behind the Anglo-German shipping rivalry than Sarajevo was ever entitled to.

The comedy of the British and Americans disputing between themselves, largely on technicalities about which the average person understands or cares nothing, the world's "largest ship," is not without its moral—and its meaning. Neither nation has contributed to making either ship what it is, ships whose possession is due to chance and nothing else.

Of course, the United States figures in this comedy involuntarily, apart from the kind of publicity with which Shipping Board activities have been governed, since this new rôle of becoming merchant mariners was forced upon the American people by the exigencies of war, but the position of the British is one not calculated to perpetuate their pride as the world's leading mariners.

"England has temporarily dispossessed us," a German shipbuilder told me in Hamburg while I was investigating that port's post-war growth, "but what we have built heretofore we can duplicate hereafter. I believe that the ideal practical ship of the future will be less than 300 feet long and will make the transatlantic journey in two days and maybe less, but if we are given half a chance—and there should be a demand for a 50-knot, 2,000-foot ship—we shall be the ones to build such a vessel."

There is room for confusion, and even quibbling, in comparing the *Leviathan* and the *Majestic* with each other, and marine engineers have assured me that so nearly alike are the two ships, without being twins, that the best comparison is apt to be faulty and the record of one can be topped by the other, under given conditions.

The *Leviathan's* gross registered tonnage, according to the Shipping Board, is 59,956.65, whereas the *Majestic's,* according to Lloyd's, is 56,551. Although certain reference books give the length of the latter as 915.5 feet and of the other at 907.6 feet, the White Star Line states that the *Majestic* is 956 feet long, while the United States Lines set the *Leviathan's* length at 950 feet, seven inches. Their breadth is 100 feet, the *Leviathan* being a fraction of an inch wider. The *Majestic's* displacement is given as 64,509 tons at thirty-eight feet, ten and one-fourth inches draft, according to the operating company, while the *Leviathan's,* according to Gibbs Brothers, reconditioning engineers, is 65,700 at thirty-nine feet six inches. It is pertinent to add, however, that there exists an inclination to dispute these displacement and draft figures as not being "final."

Displacement tonnage is considered as the fairest measure, provided it is possible, where comparisons are involved, to fix the load line equitably. A "register ton" is simply 100 cubic feet of space; gross tonnage is determined by dividing by 100 the contents, in cubic feet, of the vessel's closed-in spaces; the net tonnage is the figure representing the space actually available for remunerative service, such as the stowage of cargo or the accommodation of passengers. (The *Majestic* accommodates 4,100 passengers; the *Leviathan,* 3402).

It is clear, therefore, that the *Leviathan* is the larger ship in terms of space, just as the *Majestic* is the larger in terms of longitudinal measurement. But because vessels are customarily classified and advertised by their gross tonnage, the advantage under the circumstances rests with the American-owned ship. It is inevitable, therefore, that the final record will be one of speed and fastest voyage, from dock to dock, and as both vessels are capable of developing 100,000 horse power, the race seems destined to continue as long as they are in the service. It is predicted that the Germans will float a new wonder before the *Leviathan* or *Majestic* is retired.

The *Mauretania,* the fastest English-built ship, established the hourly speed record in 1910 with 27.17 knots, which the *Leviathan* beat on its southern trial trip with 28.04 knots, which in turn the *Majestic* has surpassed with 29.7 knots. The Cunarder's best day's run record, established in 1911, with 676 knots probably still remains the record, because the *Leviathan's* record of 687 knots was for twenty-five hours would mean in twenty-four hours a shorter distance than the *Mauretania's* by 16.48 knots. The *Majestic* has now surpassed the *Mauretania's* New York-Cherbourg record, the Cunarder's time being five days, eight hours, fifty-six minutes and the White Star Liner's being five days, six hours, thirteen minutes. It is now up to the *Leviathan* to break this record if it can.

The *Mauretania* having been for years the queen of the seas and the pet of the British merchant marine, other and larger British-built ships notwithstanding, it is worth noting that irrespective of whether the *Majestic* or *Leviathan* will set a world record of future long standing, in any case the glory rests with German-built ships. This is not said with an object of invidious comparison but merely to set forth a fact which both the Shipping Board and the White Star Line have failed to make clear.

Of course, the fact that the *Leviathan* has done so well on its trial trip, under what are said to be not favorable climatic conditions, since the equipment is supposed to function more perfectly in cooler latitudes, speaks well of the American engineers and shipbuilders charged with the task of reconditioning the mastodontic vessel, but the fact remains that the best reconditioning in the world would have been utterly futile had not the original builders of the *Leviathan* done their work so well as to cause their ship to improve with age.

The trial trip, was not without its gains; Julius Rosenwald, president of Sears, Roebuck & Company, and Charles Gimbel, of Gimbel Brothers, announced that they would instruct their buyers to travel hereafter on American vessels. As the two houses alone have about 700 buyers, and some of these make four annual trips to Europe—what more can Mr. Lasker ask?

These commercial travelers will make the Leviathan their home until Germany (or England maybe) will float a 1,000-foot, 4-day ship.

Another item of quibbling indulged in by the United States Shipping Board has had to do with passenger accommodation and service. As a matter of fact, Mr. Lasker has shown singular unoriginality in dealing with what is supposed to be *publicity* but has been veriest *press-agenting.* Even the *Leviathan's* fancy embossed booklet has all the earmarks of plagiarism, taken from the *Majestic's* folder. Except for the covers, the text and illustrations are almost interchangeable. Posed illustrations from life are not new in the transportation world, railroads having used them for years, but they have been very rare in the maritime field, and the close resemblance between the two booklets aforementioned is not a recommendation for originality. It is worth noting, too, that neither booklet sets forth the history or genealogy of the vessel advertised, and such history would be interesting, educational and sincere.

The United States Shipping Board bids for a sympathetic American audience by a prelude dealing with the *Leviathan* as a transport. It is very interesting to read that to the thousands of doughboys who came back "on the *Leviathan,* each throb of her mighty engines sang a song of victory and rejoicing"; that it is "the greatest ship in the world," and that *it comes as the supreme and matchless symbol of this new triumph of the American people,* but I dare say that such unilateral advertising must cause the Germans to chuckle, however grimly.

What can be more sordid than this absurd press-agenting and sorrowful publicity—by an expert!—which turns a German ship into an American triumph? And, collaterally, a British triumph, too? The "Levi" and the "Stick" indubitably are the foremost vessels in the world, but the truth and the whole truth in either case would have been more logical and a greater triumph, since their new ownership would be related to the victory of war.

It is perhaps well to state that, had it not been for the *Majestic's* existence, not to mention England's title to it in adherence to the peace treaty terms, the new *Leviathan* would never have ploughed the seas. The rusty and barnacled ex-transport was transformed as a challenge to British shipping supremacy, a supremacy also based upon German-built vessels, and because of the ta-boom-da-raa's preceding, accompanying and following its reconditioning, the White Star Line was obliged to play up its German ace, too.

Press-agenting has been the chief sin of Mr. Lasker, and press-agenting has nothing in common with publicity. The American people expected better information service and were entitled to it, but the fact is that the Shipping Board, mired in an ooze of press-agenting, has been regaled with less serious publicity than any other little or big government bureau or department. The merchant marine, always a universally interesting economic topic, and specifically vital to the United States because of post-war conditions, has been a subject tabooed in every editorial sanctum of any consequence in this country. Even Mr. Lasker's personal influence, where he handpicked the periodicals that suited him, failed to pre-empt the desired space.

One is not concerned with the ex-chairman's part in all this, but the situation cannot be disregarded when the most costly, mysterious, economic and perchance profitable Federal activity failed to reach the editorial ear. Sporadically some item would see the light on the front page of newspapers, and more rarely still a feature about American shipping appeared in a non-technical magazine, but on the whole even these scattered articles were forced by executive or congressional activity in the matter.

That, after all, paid advertising at so much a line was in part responsible for the unsatisfactory editorial standing of the American merchant marine, which has been too obtrusive as the United States Shipping Board, became evident with the first announcement of the trial trip of the *Leviathan.* The New York *World* read it as a junket, played it up as such, and within a week the "junket" was the foremost bit of national news in the country. It put the President on the defensive, it caused Mr. Lasker to flee from publicity and go into hiding as the ship left Boston, and has caused others to wonder what one-half of the miscellany of names actually means. What some of them mean has since become apparent—but that is not the whole story.

The junket charge by the New York daily was a matter of evolution. Whether the charge would have come to light *had not the New York World found itself in the midst of an advertising feud with the Shipping Board*—a feud fanned into being by the presence on the advertising staff of the newspaper of the ex-advertising manager of the Shipping Board suddenly dismissed by Mr. Lasker when he took office—is conjectural. But it is peculiar, is it not, that the one newspaper in the United States at odds with the Shipping Board should be the very newspaper to cry out "junket" and "extravagance"?

The interesting story—and to my knowledge not published—is that *originally the trial run was to extend to Havana,* where the *Leviathan* would be put through the paces attendant upon entering an unknown port for the first time, and the magical effect of the name Cuba upon the guests originally invited may be imagined. *"Three days to a drink and three days to sleep it off,"* some one told me on the steps of the Shipping Board entrance.

Naturally, the *World's* unexpected sensational charges necessitated the elimination of a port of call, according to the revised version of the story, and no sooner did this intelligence filter to the guests invited than they began to doubt their ability to attend. It is now very well known that *a little more than half of the original list actually was on board.*

No one knows just how Mr. Lasker arrived at the compilation of his list and perhaps no one ever will. The why and wherefore can be approximated by studying the few who had no business on board and the many who more or less interested were left out. But this much is known; Mr. Lasker deemed it obligatory upon him to invite a given number of guests from official life—invitations by courtesy rather than necessity—and in turn a preferred list of substitute guests was set up, from which were to be invited those for whom a place was made available by self-elimination.

Less is known about our Shipping Board than the people should know, thanks to this brand of press-agenting, and while it is news to many it is not news to the business world that the merchant marine of the United States is today in a chaotic condition as the direct result of petty scheming and dallying with laws, not the least of which has to do with prohibition.

Florence Allen, First Woman Supreme Judge—and Worker

Ohio Elevates Noted Lawyer to Highest Bench After Demonstration of Her Fitness

By EMERSON ROBINSON

(C) Standiford, Cleveland, O.

JUDGE FLORENCE E. ALLEN.

FLORENCE E. ALLEN, Ohio's woman judge of the Supreme Court, is the first woman to hold such an exalted position in the judiciary. An unusual honor surely, sought by many, filled by few, and the height of and ambition which lurks in the mind of every lawyer.

To Judge Allen it was another milestone in a career which has been marked by one honor and one success after another.

She is a Democrat, but believes so implicitly in the independence of the judiciary from politics that after the primaries, on the advice of friends, she became a candidate making her fight exclusively on that issue. It was only necessary to get about 20,000 signatures to become a candidate but when the petitions were filed with the secretary of state, they contained more than 60,000 names.

The women of Ohio wanted her to seek the office and they flocked to her standard, regardless of political affiliation.

Judge Allen is only 38 years old and she doesn't care who knows it. And this, by the way, makes her one of the youngest members ever chosen to the Supreme Court.

She was graduated from the Western Reserve University in Ohio in 1904 and followed this with three years of newspaper work and teaching in Cleveland.

While carrying on this work she also studied, with the result that in 1908 she was given the M.A. degree at Western Reserve in political science and constitutional law.

She spent the school year of 1909-10 at the law school of Chicago University and then went to New York, where for a year she was the legal investigator of the New York League for the Protection of Immigrants.

For the succeeding two years she studied law at the Columbia University Law School and was graduated with honors there in 1913.

Pretty busy? Yes, but also during the period, 1910-1913, she lectured for the New York Board of Education and for the women's clubs in New York and Philadelphia on current political history.

Having been declared qualified to practice law, however, she desired to enter active service and was admitted to the Ohio bar in 1914 and practiced continually until 1919.

She had a number of important cases but there were a few which stand out in the public mind of Ohio, marking Judge Allen high in the percentage column of successful pleaders. One was the so-called East Cleveland Municipal Woman Suffrage case which established the right of women to vote in East Cleveland, Lakewood and Columbus. She carried this case through the East Cleveland Charter Commission hearings, through the different courts and finally to the Supreme Court of the state.

When she had completed the argument in this tribunal one of the judges paid her an unusual compliment, one seldom received by any lawyer.

"It was the best argument before the court in a year," he affirmed.

Another case which attracted considerable attention was the proposed referendum on the Reynolds Presidential Suffrage Law. She succeeded in having declared fraudulent nine out of every ten names appearing on the referendum petitions signed in Cleveland. This issue also was carried to the Supreme Court, Miss Allen in the latter court assisting Frank Davis and opposed by the former attorney-general of Ohio, T. S. Hogan.

In 1919, women street car conductors were numerous and complaints of wages and conditions were taken before the National War Labor Board. Judge Allen was the first woman attorney to appear before this body, and when she had completed her argument the chairman, William Harmon Black, asserted that it was the ablest presentation of any case he had ever heard.

This was the last case of public interest that Judge Allen conducted as a practicing attorney, for shortly thereafter she was appointed an assistant prosecuting attorney of Cuyahoga County, becoming the first woman to hold such an important position in Ohio.

She prosecuted many cases in the criminal courts while in this office and in the following year announced her candidacy for judge of the Court of Common Pleas.

Her candidacy did not attract much attention at first among the politicians but as the day of the election drew near, they began to get uneasy. When all the ballots had been counted the papers announced that Miss Allen had been elected by the largest plurality ever given a candidate for that office.

Her administration was unusual. In the first place she demanded promptness. Lawyers have a habit of arriving at court late. In many places this is expected. The judge and the jury and the bailiff are on time but attorneys take it as their sacred privilege to stroll in a few minutes after the appointed time. They always have some good excuse. They're always busy whether they have anything to do or not. This practice did not please the new woman jurist and she quickly put a stop to it.

It was recognized without question that her decisions were just and according to law. And she was not one who believes in petting the hardened criminal. She was feared by all professionals who came before her, for the sentences she imposed were made to fit the crime. It was seldom that leniency was shown to one who had a criminal record.

She presided at a first-degree murder trial and in Ohio conviction for first-degree murder automatically means death in the electric chair unless there is a recommendation for mercy which carries with it a penalty of life imprisonment.

Another case at which she presided and which attracted attention throughout the state and nation was the perjury trial of William McGannon.

McGannon, while judge of the municipal court, became involved in a case in which murder was committed. He was acquitted of this charge and an indictment for perjury resulted. He was found guilty in Judge Allen's court and sentenced to the penitentiary.

Friends of Judge Allen were demanding that she become a candidate for some state office so that they might vote for her, and it was at their solicitation that she consented to have petitions circulated for Justice of the Supreme Court. Campaign headquarters were opened. One of her staunch friends was and is Mrs. Susan Redhan, district secretary of the Y.W.C.A. in California. Mrs. Redhan wanted to be of some help to her friend in the campaign, so obtained a leave of absence and went to Ohio and during the weeks which preceded the election handled the canvass for Judge Allen. The results show how well she did her work.

When her election was announced, Judge Allen received telegrams and letters of congratulation from all over the nation. She will make affidavit, too, that not one of them contained a proposal of marriage. Some of them, in fact most of them, were of the usual variety, but many were odd.

Of course, her election was displeasing to many, and one of these, Edward J. Dempsey, a former mayor of Cincinnati, wrote to Harvey C. Smith, then secretary of state, demanding that he refuse to issue her a commission on the ground that she was not qualified under the constitution to hold the office. Mr. Smith read the letter and gave it out for publication and—issued the commission.

Neither, evidently, was her election pleasing to some who are now her associates on the bench, for the week following she went to Columbus to pay her respects to official Ohio. There was a reception. Some justices did not attend.

The new justice always has been interested in suffrage and she was one of the leaders of the movement in Ohio from the time she began the practice of law. In this way she came in contact with women from all parts of the state and instantly won their affections. She possesses a strong personality and makes friends easily and, what is more, keeps them.

A world law against war will not come until there is a moral declaration against it, Judge Allen asserts, and cites the fact that rules of warfare are thrown onto the scrap heap when nations become involved.

The country will hear more of Judge Allen. She possesses a keen, analytical mind and she is intensely interested in public affairs. She is a Democrat, but she never voted a straight ticket in her life and "probably never will," she says.

Motion Pictures of the Human Heart

Concluded from page 3

vertical screen lines (shown on the illustrations) are called abscissae and are used to time the events of the cardiac cycle, each division representing 0.04 of a second. The abscissae are photographed on the record as shadows of a rapidly revolving wheel, which is regulated by the vibrations of a tuning fork, and called a time marker.

"Ten years ago, in many quarters, a diagnosis of heart disease was built upon gross physical signs. The symptoms of which the patient actively complained were accorded little significance, so long as his heart was free from murmurs, his legs free from swelling, his respirations free from labor and his features free from cyanosis. In those days, when an apparently healthy person presented no symptoms other than shortness of breath following unaccustomed effort, pain in the chest, palpitation, or a feeling of faintness, or when he asserted that his heart 'turned over' at times, it was customary to listen at the pericardium and reassure him with the statement that perhaps he had 'a little digestive disturbance,' or else that his heart trouble might be 'functional, certainly not organic.' A functional fault in a heart could be lightly dismissed, but suppose it had been his leg that was not functioning, would not a more thorough search have been made for the cause?

"Today, however, the profession of medicine is awakening to the necessity of adopting finer diagnostic technique and newer methods whereby heart disease can be recognized in its incipience. Nowadays, when a healthy-looking patient complains of shortness of breath, pericardial pain, palpitation and a feeling of faintness, he has, first of all, a thorough search made into his history, habits and occupation, for past or present diseases, habits and occupation may influence the heart in divers ways. The individual's pulse is carefully studied and any variations in rate, rhythm or volume noted. His heart borders are outlined to determine significant increases in diameters and, if need be, these clinical observations are supplemented by Roentgen ray examination. He is put through an exercise test to determine the rate response of the heart to effort.

"But the modern school of cardiology does not assert that heart structure altered by disease is capable of repair. Valve leaflets that are destroyed by scar tissue can never again be made to approximate each other. Heart muscle structurally altered cannot be made to regenerate itself. There is no alchemist's art for the heart. Nothing can be hoped for as concerns the reconstruction of tissue. Surgery, which has come so notably to the relief of humanity in the early treatment of cancer, affords no hope in the treatment of heart conditions except in an indirect manner, as by operations on septic foci. Surgical manipulation of the heart itself is of such infrequent occurrence and so dependent on the happy accidents of chance as to constitute surgical dramatics."

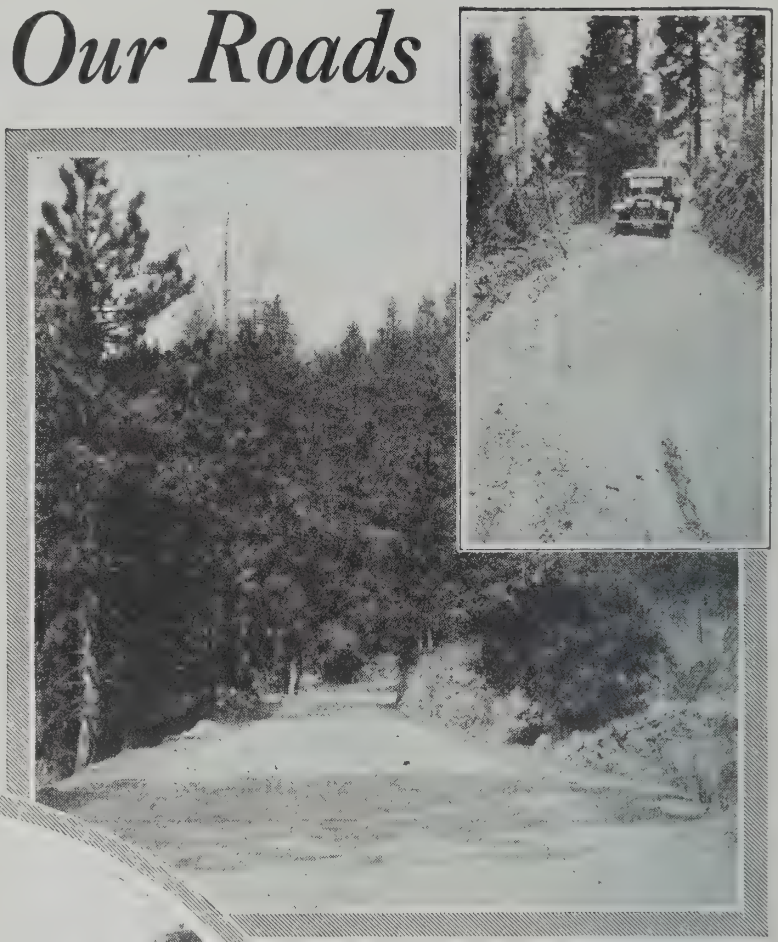
It has been stated that the motions of the wire as actuated by the heart currents are photographed. Before that can be done it is necessary to magnify the wire a thousand times. Then it appears on the film as a tiny black point which moves up and down. In each of the three leads, three major waves are shown, indicated as P, R, and T. The first of these is a small, blunt-pointed or rounded elevation, normally not more than two millimeters high and two hundredths of a second wide, and directed upward. When it makes a higher or a wider record it denotes auricular enlargement of the heart. The R wave is a lightning quick, sharply pointed elevation reaching from ten to twenty millimeters in height and one-tenth of a second in width. A great width is the sign of an aberrant or wandering heart. The T wave follows a short period during which the potentials of both ventricles of the heart are neutralizing each other. When that of the right ventricular region begins to predominate, the line on the electrocardiograph begins to rise slowly, producing the final wave of the cycle.

Why Not Pay as We Pave Our Roads and Save Millions?

California County Official Presents Sane Program to End Interest Cost

By HARRY H. DUNN

TRANSPORTATION is one of the foundation stones of civilization. The Romans learned this nearly two thousand years ago, and we Americans, along with other modern nations, have been re-learning it within the past century or less. But with our development of the dirt road into the concrete-paved highway, we have let the interest sharks and the bond-issue experts bilk us into paying for every mile of road built approximately twice the actual cost of that mile of finished highway. It is safe to say that, for every million dollars, actual cost, of paved road built in these United States in the past twenty years, *another million has been or will be paid out in interest, in the cost of bond-issue elections, in discount on the bonds and in other factors of waste which do not enter naturally or rightfully into the real cost of the building of that million dollars' worth of road.*

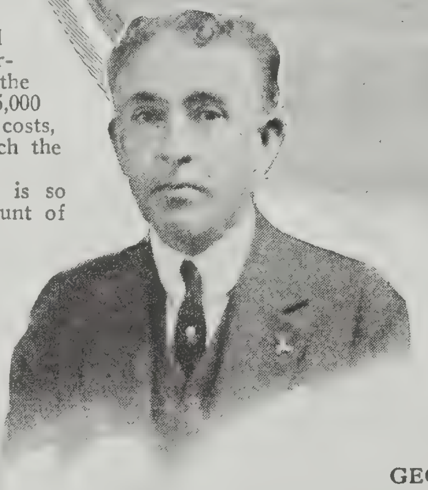


Here is a road in the mountains of San Diego County, prior to being paved, and after being paved. Prior to paving, this road, which leads through some of the most beautiful mountain land of California, was rarely traveled except by hikers; now it is traversed by thousands in automobiles annually.

California, which may be taken as an example, since road-building has progressed to greater lengths in that state than in a majority of the other states of the Union, recently put out a $40,000,000 bond issue for paved highway construction. It is less than the facts to say that the roads on whose building this $40,000,000 is expended will have cost the people of California, at the expiration of the forty years of life of the bonds, approximately $75,000,000. This does not take account of the maintenance of the highways so built, their depreciation, or the cost of alterations in them, according to the demands of traffic and transportation.

Other states which have issued similar bonds are in the same position as California, no worse and no better, and it is a fact that, taking the average throughout the United States, the paved highway, every mile of it, ultimately costs the people of that state from one and one-half to three times the actual expense of building and paving that mile. The political sparrow of the bond election, and the boll weevil of interest, not to mention the ever-present discounter at the bank, consume the difference between the $15,000 to $25,000 which the mile of paved road actually costs, and the $30,000 to $50,000 or more which the people ultimately pay for that mile.

San Diego County highway surfaced with decomposed granite, a surface which, in some sections of the West, is preferred to concrete paving. Some of the new highways to be constructed under the pay-as-you-pave plan will be of this type.



GEORGE HESTON,

Who proposes to pay for highways as they are built, at about one-half the cost of highways built by bond issues.

This financial looting of the people is so well within the law that it takes no account of the moral and ethical and economic questions raised by the saddling of our future population with the debt of a highway which, in nine and one-half cases out of ten, by actual figures, will be so useless that it will have to be rebuilt before the coming generations have finished paying the debt this generation put upon them. Unfortunately, these future men and women have no voice in deciding what we shall do with their money. If they had such a voice, we long ago would have found a simpler, better and less expensive method of providing the avenues of transportation which traffic demands. So far, however, there is no evidence to show that any state, or even the national government, has taken any practical step toward a solution of indefensible and unnecessary bond-issue methods of road-building.

One man, this year, however, has developed a remedy for the bond-issue evil, and has presented it with such force to the board of supervisors of his county, that the board has taken his project, in part, on trial. The man is George Heston, treasurer of San Diego County, California, and his plan, briefly stated, is to pay for each mile of road as it is paved, obtaining the money therefor by a slight increase in the tax rate, instead of paying 100 per cent or more in interest, bond-election costs, discounts and similar givings of something for nothing.

The supervisors of San Diego County, influenced by Mr. Heston's plan, have pledged themselves to a program which includes both bond issue and payment as paved. A $600,000 bond issue for paving a part of the roads of San Diego County was voted by the people in February. The remaining $900,000 proposed and surveyed county road work is to be done over a three-year period, by using $100,000 of the motor vehicle tax money, each year, thus accounting for $300,000, and raising the remainder of $600,000 by a direct tax, as suggested by Mr. Heston.

The entire Heston program contemplates the spreading of the necessary paved-highway building over seven years, at the end of which time *every mile of road so built will be paid for.* This is in contradistinction to the forty-year bond-issue plan, whereby the roads could be completed immediately, or within a year or two, but *the people would continue to pay for them, for four decades more.* Under the Heston plan, allowing $35,000 a year for the maintenance of the roads so constructed, the actual cost, including all incidental expenses, of every mile of road built would be $25,000. Under the bond-issue plan, the total cost of every mile of paved road built, *exclusive of all maintenance costs,* will be at the end of forty years, when the bonds are all paid for, exactly $51,275, or $26,275 more a mile than under the cash, pay-as-you-pave plan. Quite naturally, the bankers, with few exceptions, the loan sharks, and even the contractors, to say nothing of the politicians, are opposed to the Heston plan. The grouping of all these factions in this opposition is one reason that it should be considered a good plan. The main obstacle to be overcome appears to be the quite prevalent opposition of the taxpayer to an increase in his tax rate, regardless of the fact that that increase is trifling compared to the ultimate sum he must produce to pay interest on the bonds and other expenses incidental to long-term borrowing for road-building. Within the life of the present-day taxpayer, even though he be in middle age, the increased value of his property, and the augmented facilities of transportation, produced by the building of the road, will exceed many hundredfold his immediate expense in sustaining an increase in taxation. But it will not exceed for many years the outlay of 100 per cent of the cost of the highway in interest charges, for which the taxpayer receives nothing except the use of the money,

A typical road in the desert of Southern California, prior to paving, with no human habitations along it, or any attempt to cultivate the soil, which is rich and productive.

The same road as shown at left, after being straightened and paved. Note the new farms and young homes started coincidentally with the paving.

The main state highway, across the desert section of San Diego County, as it appears today, is pictured at the right. At the left the highway is shown before it was paved. Under bond issues roads such as this cost approximately $50,000 a mile, counting interest and election charges; und:r the Heston pay-as-you-pave plan, they would cost $25,000 per mile.

which he could furnish from his own pocket at no cost except the principal.

Placing the actual cost of paving highways at $25,000 a mile—which is a very liberal estimate on most California roads—Mr. Heston has worked out the following interesting statement regarding a five-year construction program, paid for as it is paved, in which he says:

"It is simple to pave the roads of any given, fairly well-inhabited territory, without a bond issue and without paying interest or election costs. San Diego County, taking this as an example because I am more familiar with costs and road-building here than anywhere else, receives from the state approximately $125,000 a year as the county's share of the funds paid in for automobile licenses in this county. This amount is increasing rapidly each year, and its rate of increase will be considerably augmented by the immediate completion of more miles of paved highways, leading in all directions throughout the county.

"Now, a twenty-cent tax rate, automatically reducing itself, will raise a minimum of $160,000, making a total of cash in hand annually, from these two sources, of $285,000. Allowing $35,000 a year for maintenance, and placing the cost of paving at $25,000 a mile, we could pave ten miles of highway every year, commencing January 1, 1924, and pay for it as we paved it. Five years of this program means fifty miles of paved roads, all paid for, with no debt hanging over them, and their maintenance paid for, both now and in the future.

"Cost of fifty miles of paved roads under the bond-issue plan of $1.[illegible],000 in bonds to run forty years at five per cent. The two tables illustrate the difference:

Period	Principal	Interest	Tax Rate
1st year	$ 31,250	$ 62,500	12½ cents
2nd year	31,250	60,937	12½ cents
3rd year	31,250	59,375	10 cents
4th year	31,250	57,813	10 cents
5th year	31,250	56,250	10 cents
	$ 156,250	$ 296,875	
End of 40 years	$1,093,750	$ 996,875	
	$1,250,000	$1,293,750	

Principal	$1,250,000
Interest	1,293,750
Election cost	20,000
Total	$2,563,750

"The ultimate cost of this fifty miles of road under the bond-issue plan would be $51,275 a mile, more than half of which would have been expended on interest and election costs, and with no allowance or source of income arranged for maintenance of the roads so built.

"Now turn to the actual cost of fifty miles of paved highway under the plan of paying for every mile as it is paved:

Period and Source	Principal	Interest	Income	Tax Rate
1st year auto tax	None	None	$ 125,000	
1st year direct tax	None	None	160,000	20 cents
2nd year auto tax	None	None	125,000	
2nd year direct tax	None	None	160,000	20 cents
3rd year auto tax	None	None	135,000	
3rd year direct tax	None	None	150,000	18 cents
4th year auto tax	None	None	135,000	
4th year direct tax	None	None	150,000	18 cents
5th year auto tax	None	None	150,000	
5th year direct tax	None	None	135,000	17 cents
			$1,425,000	
Less maintenance at $35,000 a year			175,000	
			$1,250,000	

"The ultimate cost, which under this plan is the original cost, by the pay-as-you-pave plan is $25,000. That is to say, the money thrown away in interest on the bonds, and in the cost of bond elections, as well as in other miscellaneous wastes, *remains in the pockets of the taxpayers*, while they are supplied with exactly the same kind of roads, and supplied often more rapidly, as they would have under the bond-issue plan. No burden is put on generations yet unborn, and no man profits to the extent of more than the cost of the roads, on the necessity of the people of the county or state building the highways."

It will be noticed that, under this plan, as the automobile tax increases in amount—though not in rate—each year, the direct taxation is reduced, both in amount and in rate. These tables, of course, show only a five-year program. Such a program could be indefinitely extended, with the amount and the rate of direct taxation reducing proportionately each year. Under such a prolonged project, of course, the time would come when the auto tax paid for the roads built each year.

If done in five-year periods, at the end of forty years—the usual term of road-building bonds in the West—San Diego County will have 2,000 miles of paved highway, every foot of which is paid for, on which the people owe not a single cent, and for whose maintenance and repair they have paid during the entire forty years. The cost of these 2,000 miles of paved road, maintained and in good condition at the end of forty years would be $50,000,000 plus $1,400,000 for maintenance, or $51,400,000. Under the bond issue plan, the cost of the building and paving of the 2,000 miles of highway would be $102,550,000, without taking into consideration any expenditures for maintenance.

Thus, the bare cost of the roads under the bond-issue plan would be nearly twice that of the combined cost and maintenance under the pay-as-you-pave plan presented by the treasurer of San Diego County. Rarely has a plan offering so great saving been presented to any community, yet its simplicity, practicability, and honesty are such that it probably will not be permitted to attain great popularity in the various states, owing to the opposition of the money power and of the politicians.

What Horticulture Offers

Concluded from page 7

upon tons of beets, carrots, onions and lettuce heads are required to meet such proportions. Yet the amount of land used may be no greater than that on which a back-roads farmer ekes out a scanty living.

Many market gardeners have from one to a dozen greenhouses in which they grow winter crops of lettuce, tomatoes and cucumbers. These winter crops are very profitable, and the greenhouses also make it possible to keep the help at work the year round. Without some such plan it is difficult to get good men for any season, and even a small market garden may need from twenty to forty hands during the summer months.

Years ago Adam Foster used to handle the brakes on a street car. He had ambition, however, and a little money which he had saved. He built a small greenhouse and from that insignificant beginning has developed a range of greenhouses wherein he grows winter crops on a large scale. He is supposed to be well-to-do, and probably is.

I know a Dane who worked for various market gardeners as a laborer when he first came to America. Now he has seven large greenhouses wherein he produces many tons of cucumbers. In a comparatively few years he has become independent.

A conspicuous example of what can be done in the market gardening line through enterprise and resourcefulness is M. L. Ruetenik, who lives near Cleveland. Formerly in business in the city, he has now become one of the most noted and successful growers of vegetables under glass anywhere in the country. He is said to have realized as much as $50,000 a year from twelve acres.

While these men operate extensive establishments, there are others who are getting along comfortably with only one or two houses devoted to cucumbers or tomatoes. The labor on a small plant, however, is confining, for during the cold weather most careful attention must be given to the temperature of the house. It is not uncommon for a man to place a couch or a cot bed in the potting house or packing shed attached to most greenhouses and sleep there to be ready to meet any emergency which may arise.

It takes training to become a good market gardener, and it is an interesting commentary on the business that many of the men now running successful establishments learned the business from their fathers. Any industry must be an attractive one if the sons commonly take up their fathers' work. Many other market gardeners have learned the business by working under competent foremen. Some of the agricultural schools give courses which are of great benefit to young men who look to market gardening as their life work.

Many nurserymen grow fruit trees exclusively, while others grow only ornamental stock. The two lines are quite distinct, and yet have much in common. To become a nurseryman a young man must learn all about budding and grafting. He must become familiar with varieties and learn to know them as far as possible by their bark and leaves. Then, of course, there are endless details regarding the cultivation and propagation of garden plants, many of which have vagaries of their own. Formerly a vast amount of ornamental material was obtained from across the water, but is now ruled out by the Federal Horticultural Board. This has encouraged the growing of such stock at home, and has helped to expand the nursery business. In the larger nurseries there are acres given over to blocks of rhododendrons and spruce trees, pines, firs, elms, maples, and so on.

The growing of trees from seed is a delicate operation which requires much study and experience before it can be done successfully. In nurseries devoted to fruit stock an endless amount of budding is required. In planting apples and some other kinds of trees, whatever seed is available is used.

Some large nurseries have been developed from very small beginnings. W. H. Wyman, now at the head of a very large concern, was formerly a minister, but became interested in trees and began to grow them in a small way on a lot near his home. His initial investment was small, and for a long time he sold his own goods, going from house to house. He established a reputation for square dealing, expanded as rapidly as his capital would allow, and eventually amassed a fortune. One son has already become the proprietor of a successful nursery in another town, while a second son has become his father's partner. The outlook was so good that both young men were very glad to enter in the nursery business.

One branch of horticultural endeavor remains to be discussed. On most large estates the grounds and gardens are in charge of a skilled man who is usually known as the head gardener. This man is likely to have several employes under him who look after the lawns, flower beds, vegetable garden, fruit orchards and greenhouses. They are expected to have a supply of flowers and plants for the house at all seasons of the year, and handle plants which are too rare and expensive for the commercial grower to include in his list.

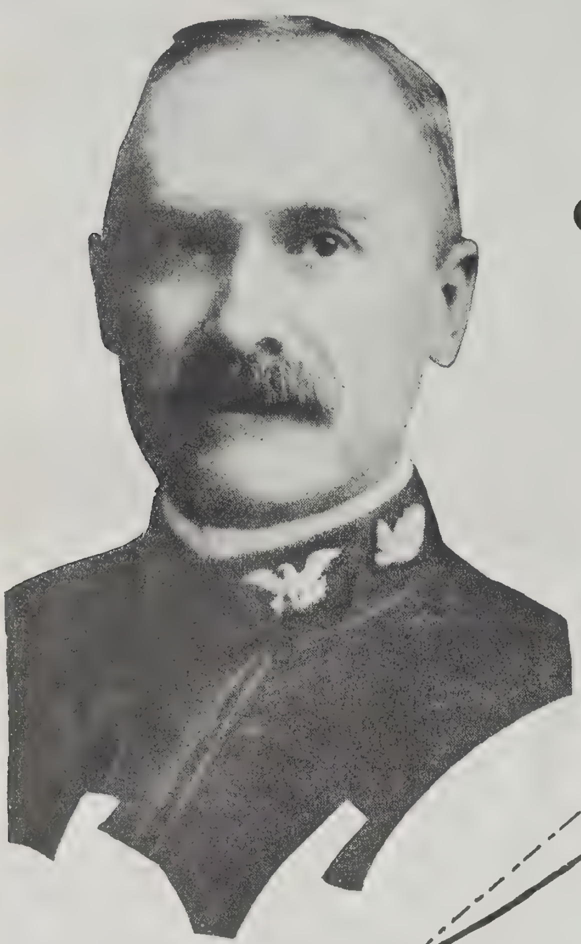
In ordinary times an expert head gardener has little difficulty in getting and keeping a good position. To make good, he must be thoroughly trained in the knowledge of plants and flowers, and be capable also of handling men. There is only one way to qualify for such a position, and that is to take training on a well managed estate. At the same time a course of study in one of the agricultural colleges is of great benefit. The National Association of Gardeners is trying to encourage a greater use of the schools. In Great Britain an apprenticeship system prevails by means of which new recruits are constantly being received. No investment is required to take up this branch of the work except what may be used for schooling, and a head gardener has in many ways a pleasant situation.

It will be seen from all that has been said that horticulture has many opportunities, which differ greatly in character; yet basically it has one common appeal. It is a product of the sod; it has to do with the growth of useful plants, and it requires for its successful practice a love of the open country and a fondness for the soil.

Einstein Theory Declared Colossal Humbug by U. S. Naval Astronomer

Capt. T. J. J. See Denounces Relativity Announcement

By ROBERT MORGAN



CAPTAIN T. J. J. SEE,

Professor of astronomy and mathematics and director of the United States Naval Observatory at Mare Island, California, who declares the Einstein Theory of Relativity the most colossal humbug of the ages.

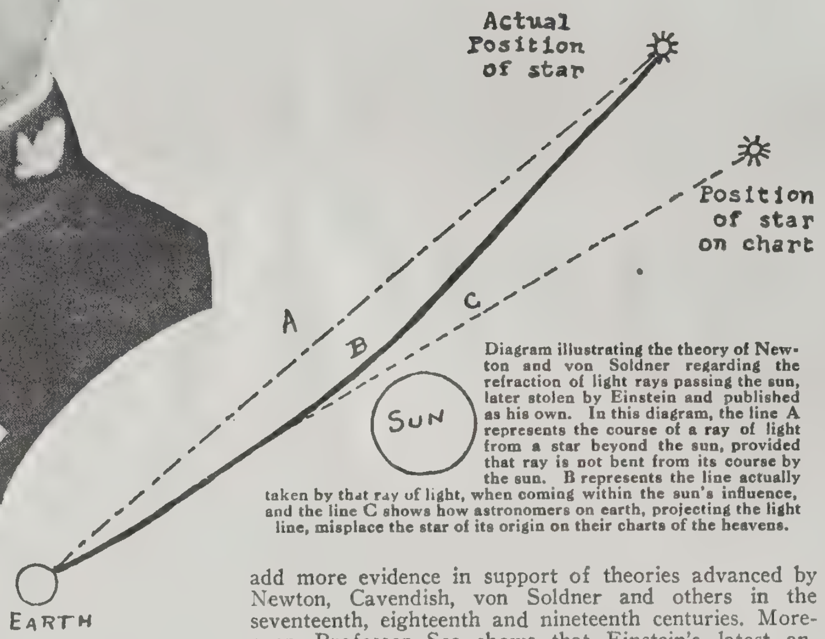


Diagram illustrating the theory of Newton and von Soldner regarding the refraction of light rays passing the sun, later stolen by Einstein and published as his own. In this diagram, the line A represents the course of a ray of light from a star beyond the sun, provided that ray is not bent from its course by the sun. B represents the line actually taken by that ray of light, when coming within the sun's influence, and the line C shows how astronomers on earth, projecting the light line, misplace the star of its origin on their charts of the heavens.

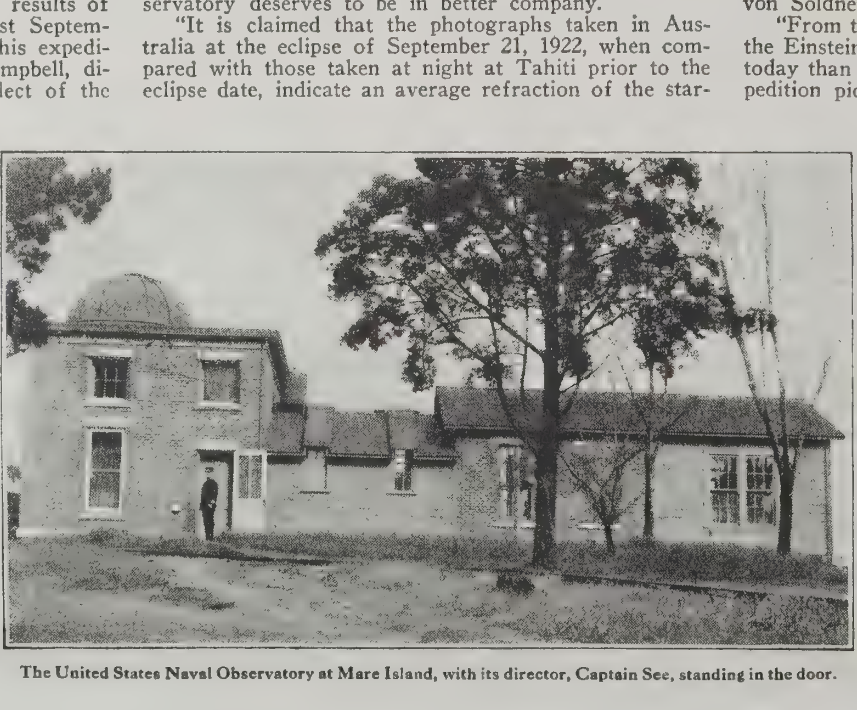
DECLARING that the Einstein Theory of Relativity is a distorted version of theories advanced and calculations made more than a century ago, for which Dr. Albert Einstein, Jewish scientist, gave the discoverers no credit, Captain T. J. J. See, professor of astronomy and mathematics, and director of the United States Naval Observatory at Mare Island, California, has worked out a definite explanation of the manner in which the stolen theory of relativity was made to appear plausible, foisted upon the world of laymen, and forced to furnish publicity for a previously unknown and very mediocre trifler on the borderland of science.

Professor See, who is one of the foremost mathematicians of this or any other country, a graduate of several European and American universities, author of a number of books and treatises on astronomy and the composition of the universe, and for more than a score of years one of the leading men of science in the service of the United States Government, was aroused to talk of the Einstein theory by the announced results of the Crocker Astronomical Expedition of last September, to the northeast coast of Australia. This expedition, in charge of Dr. William Wallace Campbell, director of Lick Observatory and president-elect of the University of California, went to Wallal, on Ninety-Mile Beach, and there made a series of photographs of stars beyond the sun during a total solar eclipse. This expedition was fully described in THE DEARBORN INDEPENDENT for August 26, 1922.

Einstein, stealing the theories of Sir Isaac Newton and Henry Cavendish, of England, and Dr. J. von Soldner, of Germany, claimed in the announcement of his "discovery" of the theory of relativity, that rays of light, traveling from stars beyond the sun to the earth, are so bent from their courses by the attraction exerted by the sun, that the position of these stars as charted by earthly astronomers is not their correct position. To photograph stars beyond the sun, it is necessary to expose the plates during a total eclipse of the sun; otherwise, the light of the sun will eliminate that of these stars. This the Crocker expedition did, during an eclipse of some five minutes totality, at Wallal, Australia. Other photographs of the same stars in the night sky were made at Tahiti. The plates from these two sets of photographs of the same stars have just been compared in Lick Observatory, Mt. Hamilton, California, and, according to announcement by Dr. Campbell, the result of the comparisons shows that this part of the Einstein theory is correct.

"The results," says Dr. Campbell, in his announcement of the conclusion of some months' study, comparison and calculation based on these two sets of photographic negatives, "are in exact accord with the requirements of the Einstein theory. The agreement with Einstein's prediction from the theory of relativity—1.75 seconds of an arc—is as close as the most ardent proponent of that theory could hope for."



The United States Naval Observatory at Mare Island, with its director, Captain See, standing in the door.

These photographs, in the opinion of Professor See, do not support the so-called Einstein theory, but merely add more evidence in support of theories advanced by Newton, Cavendish, von Soldner and others in the seventeenth, eighteenth and nineteenth centuries. Moreover, Professor See shows that Einstein's latest announcement, concerning the connection between the earth's power of attraction and terrestrial magnetism, is a barefaced theft from the American astronomer's discovery of the relation between terrestrial magnetism and terrestrial gravitation, as published in the *Astronomische Nachrichten,* Kiel, October 22, 1922.

Seated in the Mare Island Observatory which Professor See has made internationally famous as the seat of his work for more than a decade past, the American naval astronomer talked with the writer for more than two hours, calmly taking the Einstein theory apart and showing wherein it is only a stolen idea, distorted until it has become different in meaning from that of the original theories from which it was taken.

"The value of the observations and photographs made at Wallal by the Crocker expedition is very great," he said, "but the results as to the refractions of starlight passing to the earth redound to the credit of Newton and Soldner, and not to Einstein. I value highly the work of the Lick Observatory, but I regret to see it issue statements which tend to lend support to the discredited doctrine of relativity. A greater piece of humbuggery has not appeared in any age, and the Lick Observatory deserves to be in better company.

"It is claimed that the photographs taken in Australia at the eclipse of September 21, 1922, when compared with those taken at night at Tahiti prior to the eclipse date, indicate an average refraction of the starlight passing the sun on its way to the earth of 1.74 seconds of an arc. This is nothing new, since the same refraction of starlight was reported by British observers in Brazil and in Africa at the eclipse of May 29, 1919. The fact of the refraction or 'bending' of light rays from stars beyond the sun on their way to the earth being recognized and generally admitted, the *cause* of such refraction is the only factor in it with which anyone could be concerned. On this point, we have several explanations, all equally possible, and perhaps equally probable, and none of them shrouded in mystery, or surrounded by meaningless phrases intended to puzzle or mislead the public mind. Three of these explanations are:

"1. The presence of refracting matter near the sun, as shown by the corona, which extends outward from the sun for a degree or two.

"2. The magnetic field of the sun, which may give the magnetized matter a state of polarity or unsymmetrical action on light, as in the Zeeman effect.

"3. The action of the gravitational wave field, bending the rays slightly inward, *as foretold by Sir Isaac Newton more than two centuries ago.*

"The celebrated English physicist, Henry Cavendish (1731-1810), calculated the effect of Newton's theory that the corpuscles of light are bent inward toward the sun in passing near it, and, in 1801, Dr. J. von Soldner, a German physicist of eminence in his day, *actually derived the formula used by Einstein* in his so-called 'theory of relativity.' This was 122 years ago, yet Einstein never once mentions Soldner in his writings. This is bad enough, but the worst is yet to come:

"It has been shown by Professor E. Gehrcke, director of the Imperial Physical and Technical Institute of Berlin—a position first filled by Helmholtz—and by Professor P. Leonard, of Heidelberg, winner of the Nobel prize in physics, that Soldner omitted the factor 2 in his formula of 1801, which error Einstein also copied, when he appropriated the Newton-Soldner formula in the Einstein paper announcing the so-called 'discovery,' in 1911. In a subsequent paper to the Berlin Academy of Sciences, 1915, page 834, Einstein camouflaged this fraud as best he could, yet he could not prevent its discovery and exposure by Professors Leonard, of Heidelberg, Gehrcke, of Berlin, and Westin, of Stockholm. Professor Westin charges Einstein with downright plagiarism, saying:

> **"'From these facts the conclusions seem inevitable that Einstein cannot be regarded as a scientist of real note; he is not an honest investigator.'**

"In these words Westin protested to the directorate of the Nobel Foundation against the award of the Nobel prize to Einstein. For these and for other reasons which do not concern this immediate subject, the Swedish Academy of Sciences refused Einstein any recognition on the theory of relativity. Let this fact be plainly understood in considering the support given to the Newton-Soldner theory of the refraction of starlight deduced from the Australian eclipse plates. The discovery of the refraction of starlight shown in these photographs was not made by Einstein, but was taken by him from the work of other men. It has nothing to do with the colossal humbug of relativity, as voiced by Einstein, and is explainable on perfectly clear, solid and understandable grounds. The value of these eclipse observations, as I have said, is recognized, but the refraction of starlight discovery belongs to Newton and von Soldner, and not to Einstein, though he claims it.

"From these facts it remains merely to point out that the Einstein Theory of Relativity is no more confirmed today than it was before the Crocker Astronomical Expedition pictures were made; that it is not confirmed by any other discoveries or calculations sanely and honestly made, and that it cannot be confirmed. A fundamental postulate of the Einstein theory is that ether does not exist, and that gravity is not a force, but a property of space. These unbalanced vagaries scarcely require mention beyond the remark that serious discussion of them is a disgrace to our age. It is small cause for comment that the Paris Academy of Sciences, on October 24, 1921, issued conspicuous proclamations by Professors Picard and Painleve against the Einstein theory and in favor of Newtonian mechanics.

"Every one from Huyghens, Newton, Herschell, Maxwell, Helmholtz, Tisserand, Kelvin, and Poincaré to our own Michelson, knows very well that the ether does really exist. Every one knows that the ether acts with forces equivalent to the breaking strength of millions of immense cables of the strongest steel, to hold the planets in their orbits.

Evidence presented by Professor See indicates that Einstein perpetrated his latest scientific theft not later than March of this year. Under date of the twenty-third of that month, the Jewish plagiarizer of relativity announced that he had made "another discovery, which, when told in detail, will create an even greater sensation than the theory of relativity." In the same statement, which was issued at Kantara, Egypt, Einstein further said that details of this new discovery would be withheld from the public for the time being, but that "it concerns the connection between the earth's power of attraction and terrestrial magnetism."

"I discovered the law of nature which connects terrestrial magnetism with terrestrial gravitation," said Professor See. "I discovered that law which Einstein says he has just discovered, in May, 1922, and the announcement of my discovery was published in the *Astronomische Nachrichten,* Kiel, October 22, 1922."

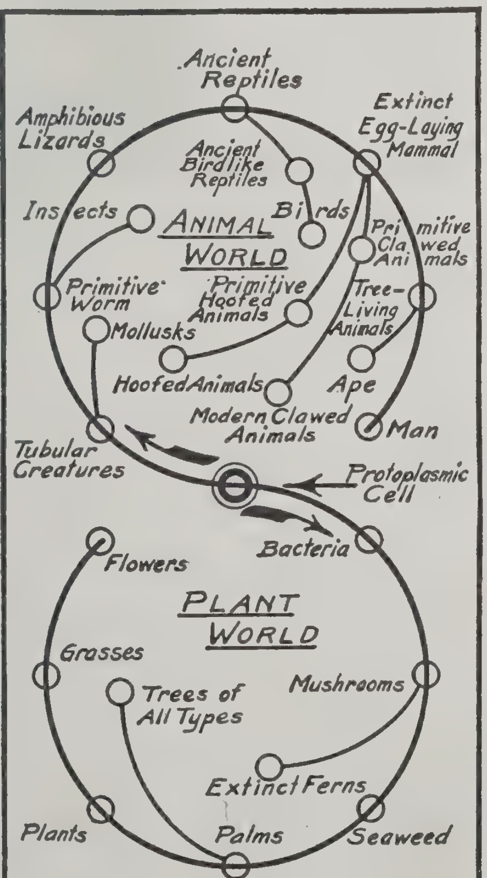
Evolution or Lineal Parallelism

EVOLUTIONISTS tell us that eons ago the the first protoplasmic cell originated under favorable conditions in an environment of sea-water. Through the geological periods these cells gradually developed in accordance with the molding factors of the evolutionary process into all the various forms of life which have appeared on the earth. Perhaps the ancestor of man and ape appeared about 60,000,000 years ago as one type of many of those forms which resulted from the ever-present influence of the molding forces. This ancestral type migrated to various parts of the earth and was continuously modified to meet the requirements of life in the new and changing environment.

In their devoted fascination for the single-origin-of-life idea, the evolutionists have lost sight of the fact that the law of probability is directly opposed to this view and in complete accord with the *theory of lineal parallelism* which holds that existence types have lineally developed from independent beginnings. The conclusions of the evolutionists are annulled by the very contentions of the theory. Responsive protoplasmic cells, located in diverse molding environments, should, at the very outset, show independent class characteristics. The supposition that the various types of plant and animal life have had separate beginnings is much more probable than the conjecture that all species are subsequent developments from the same unit type. The notion that all forms of life have developed from one basic unit is based more on the unchecked flow of the pleased imagination than upon evidential probability. Diversity is a universal physical fact. Uniformity is the silver thread, the cosmic verity, which unfolds itself throughout all diversity. The grandeur of the universe is not enhanced by narrowing its manifesting possibilities at the source. Similarity does not prove identity in origin. Similarity is diversity closely graded; it is like a shade in a graduated scale of colors. An infinite number of possibilities to produce the various shades of life were present at the beginning. Therefore it is more logical to maintain that earth life began with many shades in the organic scale than to assert that all was sameness in life's first cradle. If man has much in common with the ape it does not therefore follow that they have a common ancestor. Is it not more reasonable to assume that these two types may have *paralleled one another?* The evidence furnished by a few fragmentary bones and skeletons is too meager and doubtful to establish the blood relationship between ape and man. The thought may prove pleasing to the mind of some, as a manifestation of the marvelous possibilities of nature; but, in the absence of incontrovertible evidence, the evolutionists must show that theirs is the only reasonable assumption. We maintain that the evolutionists have neglected the most reasonable and probable hypothesis; that is, the theory of lineal parallelism which asserts that man and ape are *parallel types* having separate beginnings.



Diagrammatic representation of the *theory of evolution* in its most comprehensive form, depicting the animal and plant worlds as evolved from the protoplasmic cell.

Attempts have recently been made to place the theory of evolution in opposition to religion. Concerning the same fact, two mutually contradictory and yet true statements cannot be made. Whatever is true concerning the origin of man must be true both for religion and for science. Either man and ape have a common ancestor or they have not. It is not a question of religion or dogma at all; but it is a question of fact. Whichever of the two alternatives is true, dogmatic religion must gracefully accept the verdict and adjust its doctrines accordingly. Furthermore, there can never be any conflict between true religion and true science because true statements cannot be mutually contradictory. The assumption that life originated spontaneously is not a supposition which is inherently and necessarily opposed to religion, because it is conceivable that the Creator may have included this as a real factor in His sublime plan. Again we are face to face merely with a question of fact concerning which contradictory statements cannot be tolerated by a rational mind. What we have demanded of religion we may with equal right demand of science. The mythical and purely imaginative must not be permitted in scientific theories.

True Man

Diagram representing the *evolution* or *ascent* of man and ape from a common ancestor supposed to have lived prior to 40,000,000 B. C.

We find both the true and the false in the modern theory of evolution. It is true that modification and development constitute a universal law of nature. That life originated spontaneously is merely an unsubstantiated conjecture. Nothing less than an actual and observable case of spontaneous generation can be considered as proper evidence to introduce as the basis of any theory purporting to explain the mystery of life as merely a fortunate conjunction of purely physical factors. The evolutionists have perhaps inadvertently ignored the far more probable *parallelism theory* which permits of many possible solutions of the problem. In one form of this hypothesis it is held that man is a species of which the various races are merely branches. The ape is another separate species. In the case of all types, animal as well as plant, an individual origin is assigned. The *parallelism theory,* in another form, maintains that the various races, as the Negroid, Caucasian, and Mongolian, have had separate beginnings. This modified type of the theory insists upon a general limitation and narrowing of the notion of species to include a smaller number of members but more closely related because of greater similarity between their dominant characteristics.

The theory that ape and man have ascended from the same primitive type, in view of the more probable *parallelism theory,* now lacks even the distinction of uniqueness. Circumstantial evidence consisting of a more or less heterogeneous mixture of fragmentary bones and skeletons is entirely inadequate to bridge the gap between ape and man. The "sub-men" readily find their place in the *parallelism theory* as separate types developing contemporaneously with, but independently of the age species.

Spontaneous generation cannot be regarded as a substitute for an ultimate source of life and all that exists, because, in the first place, it has not been shown that it is possible, and secondly, if this ever can be demonstrated, the origin of those essential factors which must have been required in the process of generating life in this unprecedented manner cannot be accounted for by any other than the Theistic assumption.

Dr. John Seliskar, professor of Psychology at the St. Paul Seminary, in his lecture on "Organic Transformism," delivered April 11, 1923, made the following pertinent statement: "The advocates of the transformist view have not yet furnished us with even a plausible explanation of the generation of the first cell or cells." Dr. Seliskar's analysis of this subject is undoubtedly one of the most calmly philosophical and eminently fair presentations of the problem of evolution which have been made since it was again so violently thrust forward as the "bone of contention" between science and religion. Dr. Seliskar, in his discussion of the "unquestioned resemblances that the human organism bears to its closest anthropoid neighbors," concludes that, "Similarities do not necessarily imply genetic relationship. As long as man lives in the same environment as the other mammalia, his constitution must be substantially identical with that of the other higher animals. The food used by both classes is the same. From the similarity of nutrition follows the identity of tissue composition, of circulation, of respiration, and of the nervous system to control these processes. Striking resemblances must exist irrespective of origins, and they cannot therefore be adduced as conclusive demonstrations of identity of descent."

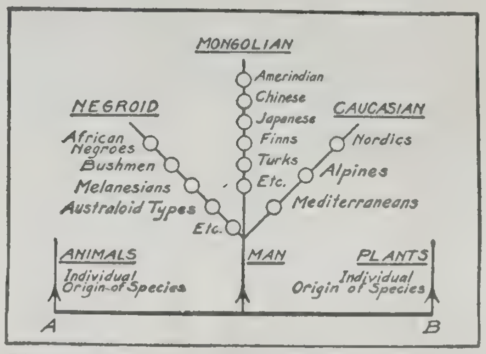

Diagram representing one form of the *theory of lineal parallelism* which maintains that life types have had separate beginnings. Line AB represents the common creative source of the independently evolved types.

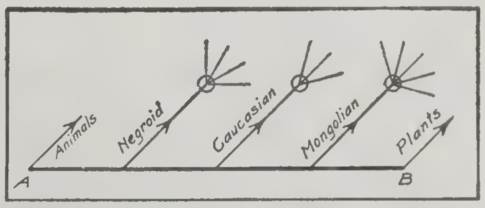
Dr. Seliskar concludes that, "The direct evidences so far advanced in proof of the animal descent of man, are not of the character to create, after unbiased investigation, a conviction that would satisfy an unbiased mind. The *anthropithekoi* and the *homosimians,* reconstructed from fragmentary skeletal remains, have not always been treated with kindness by members of the scientific profession. The so-called Trinil man (*pithecanthropus erectus*), discovered by Eugene Dubois in 1891, is classified in three different ways by archeologists. One group considers him entirely human, another altogether simian, and a third as homosimian. The Dawn man of Dawson, unearthed in England, has in his reconstructed form served as a model of the ape-man. Arthur Keith, of the British Museum, examined the physiognomy and discovered that the cranium and the jaw do not belong together, as the space for a pharynx is almost obliterated ("Antiquity of Man," p. 395). Dr. George C. McCurdy, of Yale University, has arrived at the conclusion that the two parts do not belong to the same individual (*Science,* February 18, 1916). The cranium is human, possessing the capacity of some 1.390 cubic centimeters, as calculated by Arthur Keith; and the jaw once belonged to a chimpanzee. The combination should make a number one ape-man. The Neanderthal man is the subject of similar controversies. The transformists have not yet succeeded in discovering a genuine specimen of the ape-man. The claim that the evolution of man has been placed beyond the realm of controversy is in no way justified. Science boasts of accepting only tangible evidence as the source of information. If the boast is true, assertions not so substantiated should not be made in the name of science."



Diagrammatic representation of another form of the *theory of lineal parallelism.* Line AB, here also, represents the common creative source of the independently developed types of life.

We conclude that evolution in the limited sense of restricted modification, and independent lineal development as held by the theory of *lineal parallelism,* constitute a law of nature. We cannot admit that the ascent of man and ape from a common ancestor has been conclusively established. Moreover, we insist that this theory is unnecessary because the *parallelism theory* is more probable and conforms equally well, if not better, with those contentions of the evolutionary doctrine which can be proved.

BRIEFLY TOLD

Profiteers in Bulgaria will be subject to public beatings with lashes, confiscation of their property and permanent disbarment from business under the terms of a bill to be submitted to the national assembly. Decision of what constitutes profiteering or illegitimate speculation is to be placed in the hands of the communal councils under the measure.

Fisheries experts and scientists have been unable to ascertain accurately how sponges feed. An ordinary sponge will grow from one to one and one-half inches or more a year. The portion of the sponge with which we are familiar is the skeleton or framework of the sea product as it exists in the briny deep. The slimy, gelatinous substance is decomposed by wind, weather and sunshine and subsequent soaking in sea-water cures out any gelatinous material which still adheres to the sponges.

Monsieur Barbot, a French aviator, came to this country to demonstrate a remarkable machine which half flew and half glided its way across the country at an incredibly low expense. In it one trip of seventy-five miles was made on a gallon and a half of gasoline. Meeting with a mishap, the machine was forced to the ground outside Philadelphia. It was slightly damaged and left in the custody of onlookers. Souvenir hunters tore the plane to shreds in search of souvenirs and Monsieur Barbot was forced to return to France without his machine.

Persons may eat toadstools and yet live, thanks to a medical discovery now being perfected in France. A horse was immunized by successive injections of poisonous mushrooms. The serum made from the animal was tried successfully on mice and rabbits who had been fed the deadly amanita mushroom.

Thomas A. Edison says, "There is something wrong with the college system. I don't know what the trouble is; that's not my line. I can only judge by the results. But one thing is certain: the present system of education in the colleges does not train men to think. I am in favor of the college. That is where I get some of my best men. I have 60 of them now, but they are 60 culled out of 2,000. That's a pretty low percentage, isn't it?"

An instrument which automatically and accurately records the passage of any vessel over a given body of water, night or day, to observers who may be located on shore, has been invented by an Austrian. It consists of a small searchlight sending a ray no larger than a pencil across the space to be controlled, and a receiving apparatus at the other end containing a light-sensitive selenium cell. A passing vessel interrupts the rays of a searchlight, the selenium cell closes a relay which starts a bell alarm, or operates a recording device. It will prove an aid in catching smugglers.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

With only about one-half of one per cent of the world's population, Canada produces ninety per cent of its cobalt, eighty-eight per cent of its asbestos, eighty-five per cent of its nickel, thirty-two per cent of its pulpwood, twenty per cent of its lumber and twenty per cent of its cured fish.

The Spingarn Medal, which is given annually for the most distinguished achievement by a Negro, has been awarded to Dr. George Washington Carver, of Tuskegee Institute. Dr. Carver developed 165 by-products of the peanut and 115 of the sweet potato. The medal was awarded to Dr. Carver "in consideration of his services in agricultural chemistry, his recent recognition by a British royal society and for lectures on agriculture during the last year before white and Negro audiences, particularly in the South, where his clear thought and straightforward attitude have greatly increased interracial knowledge and respect."

Bari, a seaport and important commercial town in Apulia, Italy, has a church dedicated to the memory of St. Nicholas (the American Santa Claus). The church was founded in 1087 to receive the relics of the saint, which were brought from Smyrna in Lycia, where he was a bishop, and which now lie beneath the altar in the crypt. It was at Bari that Peter the Hermit, in 1095, preached his first crusade.

The hollow-nosed "dumdum" bullets got their name from the place where they were manufactured. Dumdum is a town in British India, in the division of Bengal. It was the headquarters of the Bengal artillery in the early eighties. At The Hague conference the use of the bullets was forbidden by international agreement.

For many years the Chicago Burlington and Quincy Railroad has systematically followed the crop conditions in the territory served by its lines. The records prove that a poor corn season occurs every seventh year. While there has not been an absolute failure every seven years, taking the five states of Illinois, Iowa, Missouri, Kansas and Nebraska together, there has been a marked reduction in the yield. Bible readers know that the Mosaic law decreed a rest of the soil every seven years.

Siberia has its bootleggers and illicit stills. Of 1,120,000,000 pounds of corn harvested in the Government of Omsk last year, 180,000,000 pounds were used for illegal distilling. Within a month 900 stills were confiscated and more than a thousand persons were arrested for illicit traffic in liquor.

Rev. Mr. Maurice Rosencrantz, rabbi of the congregation Novah Zedek Talmud Torah, of Portland, Oregon, was fined $44.44 for selling intoxicating liquor to Walter Smith, a state prohibition officer. It was on recommendation of the district attorney's office and passive acquiescence of S. L. Cleaver, state prohibition chief, that a nominal fine without jail sentence was agreed upon. There was no formal trial, admission being made that there had been a tentative agreement out of the court as to procedure. Attorneys for Rabbi Rosencrantz said that he pleaded not guilty to the charge even though he admitted that he had sold the sacramental wine to a person not belonging to his congregation.

Old Spain is just now being swept by a wave of enthusiasm for all kinds of athletic sports. Football, especially, seems to have appealed to the young bloods of Spain and many of them are forsaking the lure of the bullfights for the gridiron sport. The tendency in young Spain is for participation in athletic sport rather than playing the passive rôle of spectator.

A new powder for use in small arms and artillery has been invented. It has all the driving power of the type now used and is smokeless, flashless and impervious to moisture.

An aching tooth in action is the latest subject for the movies in France. It is a film used in a crusade to improve the teeth of the people. During the war, seventy-five per cent of the men examined were dentally unfit. The film pictures a throbbing nerve in its most excruciating stages, and those who saw the picture attest to its vivid accuracy.

CHRONICLER OF THE NEGLECTED TRUTH

Melting Pot Dross Takes Fifth of Tax Dollar

Tens of Millions Spent Yearly to Care for "Socially Inadequate"

By AARON HARDY ULM

HERE are figures that are more than startling—they are amazing!

Out of every dollar raised from taxes by the states as a whole, from fifteen to twenty cents are spent on the "socially inadequate."

The total cost, to the states alone, of maintaining and caring for persons in state-owned custodial institutions—that is, the feeble-minded, the insane, the blind, the deaf, the dependent, the criminal, and so on—is approximately $100,000,000 a year.

No doubt as much more is spent for the same purposes by the cities, the counties and the Federal Government.

And half as much, probably, is spent on the socially inadequate by non-governmental agencies.

Thus the direct cost of varying forms of social unfitness or dependency in these United States is not less than a quarter of a billion dollars annually. The indirect cost, no doubt, is many times that amount.

But that takes account of money cost alone—the ramifying effect of such a volume of unfitness transcends all economic equations.

And it is shown by a scientific study recently made that from the foreign-born population as a whole there goes into custodial institutions for the socially unfit a greater proportion by forty per cent than from the total population of the country. It is nearly sixty per cent greater than goes to them from the native whites born of native parents, and is almost that much greater than the proportion of American Negroes thus institutionalized.

The survey and study were made by Dr. Harry H. Laughlin, of the Carnegie Institution, acting as the agent of the United States House of Representatives' Committee on Immigration and Naturalization. The findings are now embodied in an official document published by the committee.

Where Your Money Goes

THEY show that an undue proportion of funds thus expended by government go for the maintenance of foreign-born residents who are "institutionalized."

In fact, Dr. Laughlin estimates that more than seven per cent of aggregate funds expended by the states are for the care of foreign-born inmates of custodial institutions. It is estimated that one-half of those foreign-born inmates are aliens, or immigrants who have not become citizens.

The study, however, shows widely varying degrees of social inadequacy among different racial types of immigrants. In fact, the showings made by some are much better than for the native population. The ratings for several causes of social inadequacy show up better for most immigrant classes than for natives. This, however, may be due to the enforcement for many years of laws that have aimed at barring from the country certain patently unfit types of foreigners.

Dr. Laughlin procured detailed reports on inmates from 445 of the 657 state and Federal custodial institutions in the country—that is, penitentiaries, asylums for the insane, homes for paupers, and so on. Each report gave the nativity, parentage and color of inmates.

Each class, native and foreign, is rated as to "quota fulfillment." All inmates comprise a certain percentage of the total population of the country, the figures of the 1910 census being used, as they were the only ones that were available in detail. The same percentage of the total numbers of each class in the country was treated as its "normal" or expected quota of institutionalized persons. The "normal" is represented by 100. When there is excess or shortage, it is expressed in figures either above or below 100, which is the base for figuring the percentages.

Negro's Rating High

FOR example, in 1910 the foreign-born constituted 14.70 per cent of the total population of the country. The survey disclosed 210,835 inmates in the custodial institutions covered. The normal or expected quota of foreign-born among them, 14.70 per cent of all, would mean that 25,366 should be of the immigrant class; that is, if its average as to social inadequacy were the same as that of the native population.

"In place of this number," says Dr. Laughlin, "there were actually found 35,612 foreign-born inmates, or 20.63 per cent of the total, which gives a quota fulfillment of 140.39 per cent."

Dr. Laughlin made studies of all classes with respect to the prime types of social inadequacy leading to public institutions. These show some rather surprising facts, both as to the native and foreign-born.

Perhaps the most surprising of the larger findings is that having to do with the American Negro. His showing verges on the excellent for all except one form, criminality. But for the Negro's high rating there, the colored population would show a record, for institutionalized social inadequacy, less than one-half that of the average for the population as a whole.

The first form of social inadequacy analyzed in Dr. Laughlin's report is feeble-mindedness. There the Irish make best showing. In fact, their proportion of inmates in institutions for the feeble-minded is only 8.15—the "normal" being, as stated, 100. The Swiss immigrants come next, then those from all Asia as a whole, then the American Negro whose quota fulfillment is only 15.31.

The quota fulfillment of all foreign-born is only 31.56. The foreign-born from only two countries, Australia and Serbia, show quota fulfillments above the average in feeble-mindedness.

It is surprising, in view of the low rate of feeble-mindedness shown for the foreign-born as a whole, to find a very high rate of feeble-mindedness among the children of foreign-born parents. It is 165.39. And more surprising still is the rate for natives of mixed parentage, one parent foreign-born and the other born in this country. It is 190.27, or nearly double the average.

The low rate of feeble-mindedness among the foreign-born is accounted for, in part at least, by the fact that for about a half-century the laws have prohibited the admission of such afflicted foreigners. The affliction is easily spotted, especially among adults, the average age of immigrants being 28 years. Yet evidently considerable feeble-mindedness gets by the immigration inspectors.

North Europeans Best

BUT under the system of inspection now prevailing it is impossible to discover those who carry the inheritable factor of feeble-mindedness. That factor, according to the Mendelian law of heredity, is "recessive." That is, a majority of the children born of parents one of whom is normal and the other feeble-minded will be of normal mind. But many of the children born of these normal-minded progeny of a single feeble-minded parent will inherit feeble-mindedness. Thus it would appear that immigrants apparently normal really introduce an undue proportion of feeble-mindedness into the population of the country. Mate selection no doubt enters into the problem having to do with the bad rating of natives of mixed parentage.

The immigration laws have for long excluded the insane as well as the feeble-minded. While actual insanity may be spotted at Ellis Island, potential insanity cannot be, unless more scientifically thorough examinations are made than in the past or at present. According to Dr. Laughlin's study, the foreign-born inmates in public institutions for the insane amount to nearly twice the average proportion for all classes of the population. The foreign-born's rating there is 192.85. It is much less for natives of foreign-born as well as mixed parentages—108.49 for the first and 104.90 for the second. For native whites of full native parentage it is only 73.27. For Negroes it is only 57.23. Immigrants from Northwestern Europe exceed the average for all foreign-born in the matter of insanity. But the worst showings are made by those from Russia, Finland and Poland, Bulgaria, Ireland and Serbia. Immigrants from the three countries first named are treated throughout the report as a single group, for they were so recorded, in the main, by the census of 1910. There are comparatively few immigrants from Finland and the preponderance of those from Russia and Poland are Jews.

In the matter of crime the countries of Northwestern Europe make the best showing. For nearly all the rate is less than one-half of the average. Immigrants from Switzerland make the best showing for any group—they make an unusually good one in virtually all items. The Irish make second best as to crime. Serbs (from old Serbia) make the worst showing, as for virtually every item. Their record for criminality, as indicated by the proportion of their numbers in the prisons and penitentiaries covered by the report, is 1,400—that is, fourteen times the average for all the population.

Japanese have good ratings for virtually all types of social inadequacy except crime. Their rating for that type is 153.13. The American Negro's is 207.89.

For dependency—that is inability to get along, though having no specific defect—the Irish rate worst, 633.63, and the American Negroes rate best, only 24.02. All foreign-born rate more than fifty per cent worse than the average. Native whites born of foreign-born parents rate a little better than do native whites of native parentage.

Northwestern Europe seems to supply, from the immigrants coming to us from that area, a greater proportion of institutionalized dependency, than are supplied by the immigrants from other areas, France and European Turkey alone excepted.

Quality Inferior Now

THE foreign-born have a fairly good rating, sixteen points below the average, for institutionalized epilepsy. But there, as in the case of feeble-mindedness, apparently hidden factors count heavily in the case of descendants of immigrants. The worst ratings, in each case almost double the average, are for the children of foreign-born and the children of mixed parentage.

The combined ratings for all types of social inadequacy vary considerably. Swiss immigrants rank best, their rate being only slightly more than one-half of the average. The Japanese come next and native whites born of native parents come third. American Negroes rank fourth best, being only slightly below native whites of native parentage. Immigrants from Northwestern Europe have a combined rating of 130.42; those from Southeastern Europe have one of 143.24. The rate for Russia, Poland and Finland is 183.51.

The study indicates quite clearly, according to Dr. Laughlin, that the quality of latter-day immigration, as a whole, has been inferior to that of former periods in the country's history.

"In considering each of the several types of social inadequacy," he says, "in reference to relative frequency among the several nativity and racial groups in the United States, we have found great differences among the races in the proneness of their members to break down into certain definite anti-social or custodial types. If we fuse all of these types of inadequates into one great group, we find that the stock which has been in the United States two or more generations is, on the average, the soundest and most clearly adapted to the social conditions of America."

The following table prepared by him gives the relative ratings as to varying types of social inadequacy, and all combined, as between older immigrant stock and that of recent admission, living immigrants—that is the foreign-born now here—being excluded:

	Older immigrant stock: Native born, both parents native born.	More recent immigrant stock: Native born, one or both parents foreign born.		Older immigrant stock: Native born, both parents native born.	More recent immigrant stock: Native born, one or both parents foreign born.
1. Feeble minded	107.70	173.75	6. Blind	155.64	64.90
2. Insane	73.27	107.03	7. Deaf	134.20	80.21
3. Criminalistic	81.84	98.88	8. Deformed	66.21	294.96
4. Epileptic	93.05	186.02	9. Dependent	104.09	101.91
5. Tuberculous	89.40	122.98	10. All types	84.33	111.69

On the basis of the data gathered from the institutions covered, Dr. Laughlin estimates that there are in the country approximately 1,000,000 social inadequates requiring custodial care of one sort or another. These include all those in institutions of all kinds and the "turnover," those who have been or are destined to become inmates.

Half-million Need Care

IF THE figures for the institutions covered run true for all social inadequates, more than 200,000 of the one million requiring or subject to custodial care are of foreign birth. And actually more than one-half of these are citizens of other countries.

What the preponderant kind of immigration that has come into the country during the last generation has meant in this respect is shown by his calculation as to the proportion of these socially unfit that are made up of immigrants, the children of immigrants and of mixed foreign and native parentage. His estimate is 44.09—they are the exact figures for the institutions covered. This would mean that approximately 450,000 persons belonging to latter-day immigrant strains are so handicapped as to be subject to custodial care at public expense.

But, as indicated above, the ratio of social inadequacy for all latter-day immigrant strains does not apply to several immigrant groups.

The data covering some groups are so meager as to make broad generalizations unsafe. Dr. Laughlin's figures were subjected to the scientific test for probable error in the findings insofar as they may reflect the quality of all persons belonging to the racial and nativity groups considered. These probable errors are stated, numerically, on Dr. Laughlin's charts. In only a few cases is the margin of probable error large and in none would it greatly modify the deductions drawn.

In many cases where there may be accurate deductions as to the racial groups in the country, the findings can be at fault as to the races or peoples affected—that is, including those who do not come to America. For it is quite evident that during the last quarter of a century there has been a great deal of dumping of undesirables into America by some European countries. The Federal Government has had to enter official protests in a few cases where the practice was notorious.

Estimate Made on Survey

OTHER factors also may modify some of the deductions which might be drawn from the calculations. In the case of the American Negroes, for example, some forms of social inadequacy are less likely to become custodial than in the case of the whites. Feeble-mindedness, epilepsy, even dependency, is taken care of in great part outside of public institutions by the plantation system in the cotton districts of the South. The Negro's high rating in crime may be attributable, in some measure, to the converse of the situation having to do with other forms of inadequacy. For in some localities Negroes are held to a stricter accounting for some forms of law violating than are the whites.

The estimate of the public cost of taking care of social inadequates is based upon a detailed survey of this phase made by Dr. Laughlin for the United States Census Bureau in 1916.

The final values of his more recent study, insofar as the subject of immigration is concerned, are summed up by Dr. Laughlin as follows:

"After making due allowance for the major factors which should be considered in the interpretation of these statistics, the logical conclusion is that the differences in institutional ratios, by races and nativity groups, found by these studies represent real differences in social values, which represent, in turn, real differences in the inborn values of the family stocks from which the particular inmates have sprung. These degeneracies and hereditary handicaps are inherent in the blood.

"In order to reduce the high incidence of degeneracy in future immigration to the United States, it will be necessary for the exclusion statutes to take into consideration the stock from which the immigrant springs."

How America Is Helping to Save China

Country Is Still a Babe Among Nations Despite the Civilization of Its Three Thousand Years

By DR. NG POON CHEW

EDITOR OF *CHUNG SAI YAT PO*

The Chinese Horace Greeley

DR. NG POON CHEW,

Editor of *Chung Sai Yat Po*, of San Francisco, the largest Chinese-language newspaper published outside of China.

Forty-five years ago there stepped from the deck of an American sailing vessel to the pier at San Francisco a Chinese boy, 14 years old. He intended to return to China, but so fine were his first impressions of America that he cut off his queue, exchanged his silken trousers for denim pants—and today is the foremost Chinese in America. He is the editor of "Chung Sai Yat Po," the largest Chinese language newspaper published outside of China; is the spokesman for his countrymen in the United States; has half a dozen university degrees; has a son who was an officer in an American artillery regiment throughout the World War; has two daughters teaching English in Chinese schools in America, and one daughter teaching English in an American school to American boys and girls. Their mother is Chinese.

He is Dr. Ng Poon Chew, of San Francisco, and he is non-commissioned liaison officer between young China and the United States. He writes the accompanying article.

THOSE who have not lived in China for a long period cannot understand the Chinese; nor can they predict with any pretense of accuracy either the future actions of the Chinese people, or the probable happenings of even the immediate future in that country. I have lived for forty-five years in the United States, yet I would not endeavor to forecast the progress of the coming year in this country, so varied are its interests, and so tremendous the impetus with which it moves among the nations of the world.

China, however, is like a human being, which, having gone to sleep an old man, filled with years and with the civilization of three thousand years ago, has been reborn in its slumbers, and now awakes a babe among the nations, a child among the governments of this earth. In China, for example, a man may inflict corporal punishment on his son, at any age, whether that son be ten, thirty, fifty or any number of years old, and the son must endure the flogging as best he may. If a father undertook this sort of treatment of his son in this country, he would finish either in the hospital or the police court. This minor condition illustrates very well the position of China. With all her institutions based on a civilization more than 4,000 years old, and with 450,000,000 inhabitants just beginning to arouse themselves to comparison with other peoples, other governments, other educations, other civilizations, China, in my opinion, within ten years, will be one of the most ambitious marchers in the long procession of the nations.

This change will come about—is beginning, indeed, to come to pass already—because of two factors: First, the older Chinese are dying off; and, second, the younger Chinese are taking control of government, education, commerce and relations with other nations. And the majority, the vast majority, of these younger Chinese are being educated in the United States. More than 13,000 of them are here now, and they are returning to China to take up the burden of guiding her destiny at the rate of more than 1,000 a year. The most valuable thing they are taking back with them is technical and mechanical training, and a knowledge of English, the tongue which is rapidly becoming the language of the world, the language of business, the language of learning, the only language in which it is going to be worth while to be educated.

Above—EDWARD CHEW, only son of Dr. Ng Poon Chew, in his uniform as an American artillery officer during the World War. Below—Part of the composing room of the newspaper *Chung Sai Yat Po*. In back are shown two of the many type cases needed to contain the more than 1,500 characters used in printing this newspaper.

China is founded on too many centuries of civilization, on too many thousand years of repression, on too many ages of self-control, to be ruined by one or a score of sectional revolutions such as those which have been raised in that country recently. Less than half a million Chinese, less than one-ninth of the population of China, have come into contact with these revolutions, or have been in any way affected by them—yet we who live in America consider that these revolutionary movements actually have swept all of China. On the contrary, they have been merely sectional uprisings, affecting the lives and the work of about as many persons, out of China's millions, as inhabit one good-sized American city. It would seem that the revolutionary period has nearly passed, since there are no socialists, no anarchists, and few native bolshevists in China, and, therefore, no fuel to feed the flame of revolt.

Every young man who returns to China from the United States equipped with a trade, a technical education, a mechanical training, is worth more to China than all the money that could be loaned her, or all the diplomatic or political advice that could be given her. Every young woman who returns to China prepared to teach English, housekeeping, home economics, office efficiency, dressmaking, millinery, or any similar practical branch of women's work and development, is more valuable to China than a new president or a new commander of the army—for it is the mass of the Chinese people which is now awake; it is the bulk of the population which is now on the highway to better things, and every one of these young men and women who return with an American education to China are invaluable guides on the road to peace, prosperity and modern civilization.

That is the greatest aid America can give to China; that is the thing that the United States is doing which will save China from what appears to be the certain fate of defenseless, uncertain, unguided, uneducated nations in these strenuous days of the twentieth century. It sounds like a tremendous task, this education of the new generation of Chinese, but it is not so formidable as it sounds, since the new generation is coming to the United States to get that education, not waiting across 7,000 miles of sea to have that education brought to them. The most substantial and the most hopeful factor in all China today is the great leaven of American-educated boys and girls who have returned home to work for their own country. America, through these boys and girls, will raise a new race of Chinese on the foundation of centuries of a civilization which, before the birth of Christ, was the center of the attention of the then known world.

It is better that these boys and girls be taught English in China, before they come to this country, and taught it when they are quite small, so that when they are of college or university age, and ready to come to the technical training of the American higher educational institutions, they are familiar with the language in which they are to work, and without which, in my opinion, it is difficult for any man or woman to develop to his or her highest possibilities. This fact is realized in China, and thousands of boys and girls are being taught English in the schools there. The majority of these, as they grow to young manhood and womanhood, will be sent to the United States for their final education, but some will remain in China, studying there from those older Chinese who have spent five or ten years in the United States and have carried back to China the great progressive commercial, educational and technical life and ideas of the United States. A few years ago, the only idea which the average American had of the Chinese was that obtained from the sight of the coolie or the laborer; the thought never came that there were and are millions of Chinese gentlemen and gentlewomen. But Americans, coming into contact yearly with more and more of the younger generation of Chinese, are beginning to realize that here is a nation with a large class of educated young men and women of whom they never had heard. Thus the Chinese boys and girls coming to America, already appreciative of the United States, are implanting in the minds of the younger men and women of this country a broader conception of China, its people and its possibilities.

Chung Sai Yat Po, the largest Chinese-language newspaper in the world outside of China, edited by Dr. Ng Poon Chew in San Francisco.

Five or ten years of life in the United States, of constant contact with Americans, make of the Chinese another man, still retaining his love of country, his ambitions for China, his hopes of helping his native land to rise to a position of education and power in the world, and equipped with actual experience among the western nations to aid him in his battle for the progress and safety and peace of the country of his birth. It is a stupendous influence, a tremendous power, a mighty force for good that the United States wields in China, and she is using it well when she supplies the younger generation with a knowledge of English and practical training in the arts, the sciences and the mechanical trades. With these flow into the mind of the Chinese youth the ambition, the energy, the driving force of the American youths with whom he is surrounded. He learns a new theory of commerce, of education, of politics, and the next generation of Chinese will show the result. The country already shows a wonderful development with the passing away of the older Chinese. The new generation is cutting itself loose from tradition, and exhibiting greater faith in itself and in the destiny of China.

From an educational standpoint, the China of today is as different from the China of ten years ago as day is from night. China may fail temporarily in politics, in diplomacy, in commerce, but in education she is advancing rapidly. Superstition is receding, tradition giving place to fact, precept to experiment, and her people, even to the humblest laborer in the most remote province, is thinking along new lines to newer development. I can remember when the first railroad was built in China, in 1875, that there were riots, and all manner of opposition to the line, because it was generally believed that the new fire-spitting demon running on the rails would call forth other devils from the mountains and hills and forests and rivers. Today, there is constant application, from every part of China, for more railroads and for new highways, so that motor trucks may be used to supplement the services of the rail lines. This effort to better the transportation facilities has led to closer relations between the different sections of China, with the result that a general love of country, a national patriotism, a realization that the development of the entire country is for the betterment of all, has taken the place of the sectionalism which for so many centuries held back the four hundred and fifty millions of people in my native land.

China is large enough in area—4,500,000 square miles—to contain all of the United States, all of Mexico and part of Canada. It has more than one-fourth of the people of the world living within its borders, and it has an unbroken history of 4,500 years. Family trees are cumbersome in China, for there are some families which can trace their ancestry back for eighty

Escaping the Crowd

THE London *Daily Express* recently offered a prize of thirty pounds for the quietest resort in England. The offer is significant of the change in America as well as in England of the character of persons and amusements which dominate summer and winter resorts.

Vacations were formerly looked forward to as periods when deserved rest might be obtained after a season of attention to business. In recent years, the quiet seashore and mountain resorts which grew up in response to the demand for a restful atmosphere have almost disappeared. Hotels are crowded with noisy guests. Those who desire to make themselves conspicuous dominate the lobbies. Amusements, notable chiefly for their excitement, have succeeded the quiet restfulness which formerly ruled.

The condition is a dangerous one. Persons, whose natural penchant is for rest and recuperation after hard work, are compelled to accept noise and excitement during their vacation periods. The result is certain to be reflected in their work after the vacation is over. Many employers have come to recognize that their returned vacationists are worthless for productive labor until the effects have worn off. The result is mutually bad.

The only cure for the situation lies with the individual. He must plan carefully, almost secretively, to escape the places where the crowd goes. Otherwise, he must take the consequences.

Putting Bandits to Work

WHEN Chinese bandits attacked a train on the Tientsin-Pukow Railroad some weeks ago, alarm was expressed over the danger of intervention in China by the powers. Government in China is always more or less of a mystery to the western world, and the institution of banditry is something it is difficult to view as an honorable profession.

The long negotiations which resulted in the freeing of the American captives, at the price of an indemnity, and the acceptance of some of the bandits as soldiers, did not allay anxiety, although it removed the temporary cause for the intervention talk. It would be unfortunate if the powers, some of whom are admittedly inspired by selfish industrial aspirations, were permitted to meddle with Chinese affairs. One encouraging sign which comes as an incidental result of the bandit raid indicates the possibility that China may be able to work out her political and industrial destiny alone. Responsible agencies are seeking to destroy the bandit evil. They are planning to try good roads as the antidote for outlawry.

There is one section of China about 200 miles square, containing parts of Shantung, Kiangsu, Anhwei and Hunan provinces, which has been a bandit paradise for centuries. Banditry has been a recognized profession. There is some farming and fruit-raising in the district, but practically all the inhabitants rely on banditry for their main source of income. Reports are that many girl children are sold into slavery at an early age while boys become bandits as soon as they can carry rifles.

This bandit-land is inaccessible except by the primitive methods of sedan chairs, carrier coolies and donkeys. The Tientsin-Pukow railway which crosses a portion of the district affords practically the only touch of modern travel methods. Now, it is proposed to fight banditry with road machinery. A system of modern roads has been suggested, radiating from a central town and reaching to the seacoast. The engineering problems are not considered difficult, and abundant road material within the district assures a low cost of construction.

The advocates of the road-building point out that the work would utilize all the surplus labor of the district and would gradually turn the minds of the people to peaceful constructive labor. The establishment of good roads would also provide greater possibilities of putting the country under adequate police control.

One American company has already done much to reduce outlawry in Shantung by employing 15,000 men in repairing the channel of the Yellow River. Hundreds of these laborers, recruited from the ranks of bandits, have demonstrated that their careers have not made them unfit for peaceful labor.

The Chinese officials tried force against banditry without success. The military official at Tsaochwang beheaded 1,000 bandits without appreciable reduction of the outlawry in the district.

Now, however, with the prospect of furnishing work to the unemployed of the land, the Chinese authorities see an opportunity to destroy the outlaw profession. The idea opens up endless possibilities for development of China's vast resources Good roads in Shantung mean that ultimately good roads will strike into the heart of Asia. Once the potential riches of China are opened to the world, the day of banditry will be over. Profits of outlawry will be insignificant beside the legitimate return from development of the land.

Anthracite Profiteering

A FEW weeks only remain before the expiration of the anthracite wage agreement. Mine operators and miners are negotiating. And speculators are preparing for a clean-up at public expense, if the periodical strike panic should be afflicted on the country again.

It is admitted that the production of hard coal has been sufficient for the country's needs. But many sections of the country have found it impossible to procure the fuel. The recognized channels of purchase are unable to fill the demand. Meanwhile New York coal brokers are prepared to furnish anthracite—at a price.

The United States Coal Commission decided, what everybody knew, that coal is a commodity, intimately affected by the public interest. It found that miners were not too highly paid, that profits of producers, jobbers and retailers were ordinarily not excessive, and that other charges, such as transportation and mining costs, were in keeping with the normal price movements.

In times of shortage, however, it was discovered that jobbers often bought and sold the same coal several times, *pyramiding the profits.*

The Coal Commission's findings make the coal business, the public business, not for the government to own or operate but for the government to watch, and supervise. There is plenty of hard coal. The government should see that no speculators are permitted to manipulate a strike panic, that buyers will be forced to take anthracite at any price. The government should see, also, that supplies of coal are not unduly hoarded by individuals who seek to profit by apparent shortage of a commodity in which there is no shortage. The coal problem is a vast problem. But for the moment at least, the immediate problem is the coal speculator. The government should prevent him from wringing his pyramided profits from the public.

Alaska's Fish

PRESIDENT HARDING, on his arrival in Alaska, was presented at once with a practical problem. Practical problems are the important things in the government of a great nation.

Indian natives presented formally the oft-repeated protest against the taking of all the salmon by the canneries. On the coast, salmon furnishes the entire livelihood for many of the Indians. A shortage in the supply of the fish means hunger, perhaps starvation. The great fishery industry has been taking salmon in such quantities that the fish was threatened with practical extinction.

Mr. Harding told the Indians that the salmon industry was important to the world as well as to them. But he admitted that the Indian should be given some return for the reduction of the food supply on which he had relied for centuries.

The remedy would seem to be clear. The government should limit the take of salmon. Sufficient food supply should be guaranteed permanently for those natives and others who choose to make the fish their food. It will not be necessary to destroy commercial salmon-fishing. Science is equal to the task of regulation of methods and times of catching the fish, which will permit a continuing supply, while it permits a satisfactory quantity to be canned each year.

The Rising Tide of Debt

THE rising tide of public debt shows no sign of abatement. President Harding, in one of his western speeches, asserted that the National Government is making appreciable progress in reducing its obligations, but took occasion to sound a note of warning over the extent to which states and municipalities are plunging future generations of taxpayers into debt.

The *Daily Bond Buyer* of New York publishes a compilation of the bond issues which have been floated by states and cities during the past decade. The analysis shows 1922 as the peak year, but 1923 is only a little behind in the total of the obligations which it had loaded upon future energy and industry.

During June, 1923, bond issues totaling $160,070,166 were floated by states and municipalities. During the six months ending June 30, securities of this type amounted to $600,198,478. In 1922, June's bond total was $169,994,241, while the first six months of that year established the alarming record of $734,403,276 in municipal and state bond issues.

During the past ten years, the lowest total of state and municipal issues was in 1918, when the first six months' sales amounted to $134,133,084. That was the year in which the Federal Government was floating the greatest portion of the great loans, which it deemed necessary for war purposes. The influence of the national government during that year was set against great municipal and state outlays of funds. Once the Federal hand was removed, however, states and municipalities ran wild in their efforts to spend vast sums in public projects. Contracts were let at the times of peak costs. The fall of basic prices at the time of the financial deflation does not seem to have influenced public officials, who contracted the habit of excessive public spending. The result is the mounting debt.

The bond problem is a national problem. A profligate city or state is not alone injured through the growth of interest and sinking fund charges. The rising taxes in the most extravagant municipality must be paid in increased prices, whose effect will be felt in ever-widening circles, until the whole country pays the bill.

High-priced Words

BEFORE that portion of the American public which reads certain newspapers there appeared the other morning the name of a new author. The name was that of Luis Angel Firpo. Firpo is a prize fighter. He is an Argentinian of Spanish-Italian descent. His English vocabulary admittedly is limited to a few simple monosyllables. Yet, he was presented to the reading public as having been the writer of a wordy analysis of a prize fight in which he engaged.

Every day during the baseball season, subscribers to a certain newspaper syndicate solemnly publish articles, dealing with analyses of past games and prophecies of future fortunes of the diamond. The reputed author of these articles is Babe Ruth, the most outstanding figure of the national game during the past few years. During the World Series each year, the names of other players, umpires, sometimes strolling actors, are used as authors of accounts of the games.

Jack Dempsey, the heavy-weight prize-fight champion, is cast in the role of author to help press-agent his own fights. Other individuals of lesser note are hired by newspaper syndicates for expert analyses of events in professional sport of all kinds. A professional golfer's name appears above the accounts of the great national tournaments. In a sordid criminal trial which has attained much notoriety, the defendant is sometimes hired by sensational newspapers to allow his or her name to appear as the author of highly colored and emotional accounts of the proceedings.

It is doubtful if any newspaper executive still entertains the belief that he is fooling his readers when he places the name of some inarticulate individual at the head of the story as its author. Ill-written as are some of the articles, few readers would credit Firpo, Ruth or Dempsey with the involved phrases. The persistence of newspapers in exploiting fake authorship can be charged to nothing except habit. It is bad habit, too. Newspaper executives are highly sensitive to criticism, more so than the public men whom they criticize. It would take only a few objections by the reading public to put an end to the stupid camouflage of authorship.

Mr. Ford's Page

THE origin of the newspaper was probably an efficiency system unconsciously applied to news distribution. Formerly, except among organized government and the people of one race, news was transmitted by individual interest rather than by any kind of public system. Men have always written for publication but it is interesting to note that, until comparatively recent time, men have not cared to write news except that the news may have had scandalous or military interests. In former days when position and power carried no equal responsibility with what they pretended to be, the occupants of those positions furnished through their irresponsible behavior the only diverting gossip then given to the people.

> *HONESTY and accuracy in reporting are qualities which seem largely to have passed from the editorial rooms of the big-city dailies. Sensationalism in writing and in the handling of news, and the very type of news that is featured have succeeded in breaking down old-time traditions and practices. Then, too, counting-house control of the editorial policy, which has come about through compelling the advertisers to bear the entire burden of publishing, also has been a great factor in ending the newspaper's usefulness in serving the public. It is possible that before the press is entirely discredited everywhere that a beating-back will be attempted. It is not too late, now, but soon will be. The press of today has practically ceased to be a power changing or connecting the current of events.*

It would be almost permissible to say that the earliest popular news was gossip about personalities. Presently, however, positions of power were not obtained by the accident of birth but by the merit of knowledge, and then the interests of popular writing changed from gossip to news. It is possible to judge for oneself how far this improvement has gone by estimating how far in one's own morning or evening newspaper the subject of gossip compares with the subject of news. The examination may be made a trifle more severe by comparing the interest by writers shown in the subject of gossip as against real news.

News, unless it be really world-shaking is not in the race with ordinary gossip in average newspaper practice. Of course, there are exceptions to this estimate. Ten or fifteen years ago one would have said that the larger newspapers were the exception. Today, the facts would compel almost any one to say that taking the subject of newspaper carefulness as a whole, especially in relation to this distinction between gossip and news, the smaller newspapers show the better sense of accurate editorial information. In looking for an explanation of that difference one comes upon the statement of a professor of journalism that the majority, if the really trained investigators are estimators of fact, that is, the graduates of schools of journalism connected with our universities are going to the smaller newspapers where they may easily obtain a managerial interest and control some of the more unworthy modern tendencies. No man wishes to write unless it is possible for him to have some honest word about that which he writes. Perhaps the limitation which honest, earnest newspapermen feel most is the haste for the "story" which can be immediately printed instead of the story which may be obtained after study and research. The former may be diverting; it is seldom informing.

The case has come to be this: the fullest details have been given upon matters which are of least public importance, and to those matters upon which intelligent men usually look for information the least attention is given. That is, if of two articles one is to be cut, an article dealing with an actual and intelligently stated economic situation overseas and an article dealing with a sensational runaway, the first named will suffer. As a result hundreds of persons in the United States (and the custom is not mentioned with any idea of commendation) have come to depend more on privately circulated news letters than on publicly printed newspapers. This fact does not, of course, impress newspapers because of the shock absorber which business men's success happens to be. It is a great thing and a saving conviction and a future policy to prevent financial success from being a barrier to a revision of principle.

As a matter of observation the greatest reason offered by successful newspapermen against a drastic change of policy is an undeniable financial success of the present system. But the question to ask is this: Would not people be glad to buy quality, would not advertisers be glad to buy quality, would not all the returns be better if the medium were better? It is said that Dr. Lyman Abbott said one day, when informed of a big increase in the circulation: "Our circulation may be increasing but is our influence necessary?" Many a great and financially successful newspaper today may well ask if its influence is not sadly decreasing. The problem of the newspaper is making production and distribution pay for itself. Every service ought to pay for itself. Perhaps in news publishing one service has been made the burden bearer for the rest. It is not against the idea and practice of newspaper advertising that it has come to bear the principal burden of the publishing business. It may, however, be a criticism on the farsightedness of the publishing business that it did not originally see that in supplying its readers with the trade news, otherwise called advertisements, it has been rendering a service to its readers and subscribers.

Banks, to set an example, have been paying people to save money instead of charging people for keeping safe custody of their savings. Likewise advertisements have been the one service which newspapers have consciously or unconsciously pretended to give for nothing.

The newspaper was a great force in the formation of opinion. It may become so again. If it returns to its former power in this respect, it will have to go into advance of the public mind and furnish that mind with all the facts necessary to an approximately correct conclusion. If, however, the press continues as now in simply recording the use of public opinions that it never considered possible, it may serve as a thermometer but not as a power changing or connecting the current of events.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Millions Spent on Indians Declared Wasted

Member of Congress Shows Folly of One Agent for Ten Families

By M. CLYDE KELLY, M. C.,

THIRTIETH DISTRICT, PENNSYLVANIA

THIRTEEN MILLION DOLLARS will be spent next year by the Bureau of Indian Affairs in the Department of Interior—a greater sum than is spent by the entire Department of State with its world-wide activities, and twice as much as the entire Department of Labor costs the American people. Such a sum would more than maintain the entire Custom Service or the complete Coast Guard organization.

What is the good of it?

It is spent to enable 5,000 government employes to supervise and superintend 50,000 Indian families. IT ASSIGNS A GOVERNMENT AGENT TO EVERY TEN FAMILIES FOR 1923 AS HAS BEEN THE CASE FOR MANY YEARS. The public pays the bill.

If there was deadly danger that the Crows and the Blackfeet, who refused to shed the blood of the white men even while they were being robbed of their hunting grounds, might descend upon Chicago and ravage the Windy City with knife and fire, the money would be well spent. If the Sioux and the Apaches were threatening to go on the warpath against Omaha and St. Louis, the expenditure of $10,000,000 would be amply justified.

But the difficulty is that no advocate of the costly system of Indian Bureau control will say that this great sum is necessary to protect the American people against the Indians.

No, they say that America must sacrifice these millions in tax money *for the benefit of the Indians!* These 50,000 families must be protected and guarded!! One agent must be allotted to every ten families, not to help the American taxpayers but to help the Indians!!!

That, then, is the crux of the matter. The whole case of the Indian Bureau is based on the declaration that it benefits the Indians to the extent of the millions raised by the severe taxation of the American people.

If it be shown that no such benefit comes to the Indians through the bureau, the case falls. And if it be shown that the expenditure of the millions taken out of the pockets of the American public in fact *works an incalculable injury to the Indians themselves,* then the appropriation of further funds is infamous.

Bureau Injures Indian

I DENY that this $13,000,000 appropriation benefits the Indians. I propose to prove that to the satisfaction of any person save those who may profit from the present bureau system. I believe that the Indian would be better off today if the Indian Bureau had been abolished twenty-five years ago.

Here are 300,000 human beings of a race which for ninety years has been under complete control of the Indian Bureau. During that time they have been forcibly driven off their homelands of the Eastern States and herded into reservations west of the Mississippi. These reservations *whose bounds were laid out in sacred treaties* have been cut in two, oftentimes without a word to the Indians concerned. *Not a treaty made by the United States Government with the Indians has been kept* and these acts of faithlessness have either been initiated or approved by the Indian Bureau—this alleged protector of a helpless people!

The Indian reservations, diminished even as they have been, have become very valuable. The building up of the West has added to the value of every acre. On some reservations great oil deposits have been discovered and minerals of various kinds have been found. There are valuable forests on others.

Not because of the Indian Bureau but because of the national growth of America, *and in spite of the Indian Bureau,* the lands still left to the Indians became valuable.

In all, the 50,000 and more families under the control of the Indian Bureau have lands and other property worth a billion dollars today.

That means that every Indian family possesses wealth to the extent of $15,000 and more. It means an average income of $900 for every Indian family, which is more than the average income for all the families of the United States.

These Indians, possessors of this great wealth, *are starving for lack of the necessaries of life.* Economically independent, the Indian is still kept dangling to a pauperizing, degrading bureau system. Does it benefit the Indian to have bureau agents *dissipate his property* while they spend *millions of the public tax funds as well?*

It is loudly declared that the great tax appropriations must continue because it would be cruel and brutal to reverse our policy of ninety years. Self-styled "friends of the Indians" cry out that the Indians do not want freedom and its responsibilities. "Oh, no," they exclaim, "The Indians are begging to be allowed to remain under the sheltering wings of the Indian Bureau."

It has cost millions of American dollars to build up that falsehood and foist it upon the American people. The officials of the Indian Bureau know that statement is not true. They know the tricks and schemes and fox-like watchfulness necessary to give it even a semblance of reality. They fight to death any plan to settle the question by fair vote. They oppose any investigation which would show that the wings of the bureau give shelter to the Indians just as the hawk's wings shelter the partridge.

The desires of the American Indians, wherever a free opportunity is given, have always been shown to favor freedom and to oppose bureaucratic control. This fact is so well known to the Indian Bureau that it has for years arrogated to itself the right to supervise and control the election of council members and tribal delegates.

The superintendent of the reservation must put his seal of approval on the Indians who vote. He must approve the delegates elected. He assumes the right to fill all vacancies. As a final quencher of free representation, the Washington office exercises the right of recognizing only such delegates as it desires. And all this on an Indian tribal council!

The Flathead Indians had a council in 1921 which represented them. They selected Max J. Barnaby and Mary Lemery to come to Washington to correct certain abuses in administration.

The bureau could not deny the election, but nullified it by officially declaring that the business committee of the Flatheads was the real tribal council. Since the superintendent had named members of the business committee, he felt justified in making it the official body representing the Indians.

The Hon. M. CLYDE KELLY

The two regularly elected delegates came to Washington with their credentials. They were not recognized by the bureau and when Senator Thomas J. Walsh took up the question of the payment of expenses from Indian funds he received this answer:

"The council from which Miss Lemery and Mr. Barnaby claimed authority to come to Washington was not an official tribal council of the Flathead Tribe and both are familiar with the order against coming to Washington at the expense of the tribe without procuring authority in advance."

It was not an "official council," because it was not completely under the control of the bureau officials. "Authority in advance" is only given those who represent the bureau rather than the Indians.

Majority Seek Freedom

IF THE Indian Bureau believed that the Indians are so devoted to their kindly control, would they stoop to such methods? The bureau knows that a fair and free expression of the will of the Indians would show such an overwhelming majority in favor of freedom that it would end forever the expensive legend that these original Americans are hugging their fetters.

These are not all the powers and the plots used to silence the Indians. Officials on the reservation and in Washington promise special favors for the silence of leaders who have voiced complaints. It is very easy to throw money and position in the way of the man who is a potential trouble-maker for the bureau. Many have been tempted and some have fallen, but it is well to record, for the sake of human nature, that the great majority have spurned the bureau bribe and have refused to sell out their fellows for individual gain.

Let any white man go to one of these reservations and tell the Indians that all men are created equal and have inalienable rights to life, liberty and the pursuit of happiness. Let him tell the Indians that they should be freed from bureaucratic control and compelled to obey laws of state and nation as Americans.

That is high treason. There is an Indian Bureau official to stamp out these infamous doctrines. Back of that autocrat is a jail and police and back of all stands the entire Government of the United States. Out goes this dangerous disturber of the peace—of the bureau.

If that be the fate of a white American citizen, what must be the abject helplessness of the uneducated, isolated Indian and what must be his heroism when he dares fight on against such overwhelming odds?

To live at the whim of bureau officials is the last and worst misery that human beings can feel. It is calculated to convert men into creatures without ambition because without hope. I have heard an old Indian say, "Our grandfathers died in slavery; our fathers died in slavery, we may die in slavery and our children may die in slavery, but something will come of it at last."

Something will come of it now, if Congress has Americanism enough in its make-up to deal with this un-American institution. It is high time to reverse the maxim of bureaucracy, "the Indian is made for the bureau and not the bureau for the Indian."

These appropriations benefit the Indians? You will never say so when you study the history of any of these tribes and know the audacious injustices perpetrated upon them down the years.

Let us take the Blackfeet Indians for example. In 1855, the United States negotiated a treaty with the Blackfeet, formally recognizing their ownership of a great tract of plains and mountains, bounded on the north by the Canadian line, on the west by the summit of the Rockies and on the south by the Musselshell River and the Missouri to the mouth of the Milk River and on the east from the mouth of the Milk River north to the Canadian line. That territory was to be the home and hunting grounds of these Indians.

But in 1867 an executive order fixed the southern boundary on the Missouri River.

Land Gone, Tribe Going

OTHER executive orders took away half the land by fixing the Marias River as the southern border.

The Indians were never consulted about this diminishing of their reservations. In fact the first they even knew about it was when United States soldiers rounded them up in their buffalo grounds and drove them north.

The Indian Bureau was to furnish them food supplies, but in the winter of 1883, five hundred Blackfeet died of starvation because there was no provision made for them.

Then in 1887, the United States besought the Indians to sell a great tract in the eastern part of the reservation. For the sum of $1,500,000 they parted with their heritage.

Once more in 1896, representatives of the government came to them and persuaded them to sell the western part of their reservation, the region which is now Glacier National Park, for another $1,500,000.

The money received was placed in the United States Treasury. All of it and a great sum besides has been spent by the Indian Bureau for the alleged civilization and support of these deluded Americans.

The tribe has been decimated by disease and starvation and for more than a generation they have suffered misery which could come to serfs, despised and neglected by their masters.

In 1915 United States Senator Harry Lane, of Oregon, made a personal inspection of the reservation and reported to the Joint Commission to investigate Indian Affairs. Here is what he said:

"The condition of the full-blooded Indians in this district, many of whose homes I visited, was pitiable . . . .

"There is no game in this country, or at least not enough to afford them subsistence. I was informed that to keep from starving they had killed and eaten all the prairie dogs and also had resorted to eating skunks.

"They are unable to protect themselves from acts of injustice done them and are thus deprived of a remedy for their relief and have been left to rot through the incompetence or wilful neglect of those in charge of them and their affairs. Indeed it has heretofore and is now said to be unsafe for anyone who can be 'reached' to present claims or complaints to Congress. It is cords to the wrists and gyves to the heels for anyone who undertakes the thankless task, and such persons are pursued and harassed, and the sole effort which is afterward made seems to be to cover up the evidence and put upon trial the complaining witness in place of trying to remedy the evil or punish those guilty of wrongdoing.

"While upon the reservation I had experience with these tactics . . . . Right foxy and well able to take care of themselves are the gentry who are responsible for the gross mismanagement of the Blackfeet and other Indians."

Senator Lane made his investigation and criticisms more than seven years ago. Not one advance has been made in that time toward better conditions. Every year since, the Indian Bureau has fastened tighter its hold upon the Indians.

Under date of September 28, 1922, the Commissioner of Indian Affairs, in response to my request, gave me a statement as to the financial condition of the Blackfeet Indians.

He stated that there is $54,196.26 in the United States Treasury to the credit of the tribe. The receipts from grazing leases were $32,586.20 in 1917, but they dropped to $1,503.54 in 1922.

In the meantime the appropriations from the Treasury for the support and civilization of these Indians increased from $24,681.94 in 1917 to $59,348.33 in 1922.

The commissioner reports that the bureau placed a tribal herd on the reservation on the reimbursable plan.

To Discuss Wisconsin Is to Discuss "Bob"

For Twenty-five Years Senator La Follette Has Been State's Political Mentor

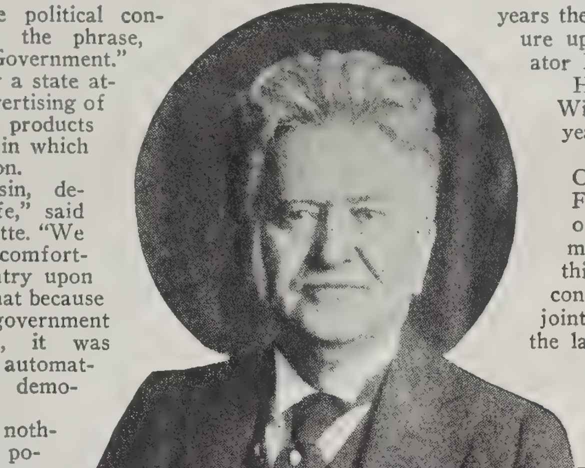
By FRED L. HOLMES

WISCONSIN is a Progressive state. This distinctive political environment is not so old as to tarnish the state's escutcheon by age; nor so young that it has no ancestral traits to make up its individuality. It started its drama of reform against the old political order of things more than a quarter of a century ago, when a young Dane County district attorney charged in political conventions that the farmers and manufacturers of Wisconsin were paying double the taxes of the railroads; that the lumber barons and railroads dominated politics, and that the legislative sessions were but stool-pigeon conventions for those who prey on government for private power, influence and wealth.

Out of these political contests has come the phrase, "Representative Government." It is as distinctly a state attribute as the advertising of its cheese, dairy products and canned peas in which it leads the nation.

"To Wisconsin, democracy is a life," said Senator La Follette. "We have long rested comfortably in this country upon the assumption that because our form of government was democratic, it was therefore automatically producing democratic results.

"Now there is nothing mysteriously potent about the forms and names of democratic institutions that should make them self-operative. Tyranny and oppression are just as possible under democratic forms as under any other. We are slow to realize that democracy is a life and involves continual struggle. It is only as those of every generation who love democracy resist with all their might the encroachments of its enemies that the ideals of representative government can even be nearly approximated."



SENATOR ROBERT M. LA FOLLETTE

To talk about political conditions in Wisconsin without discussing La Follette would be like reading Shakespeare's "Hamlet" minus the courageous soul and immortal words of the destiny-driven Dane. For twenty-five years, he has been the state's political mentor.

Out of his early political struggles in the state came one of the first complete primary election laws; a railroad commission with power to wipe out rebates, secure equality for both large and small shippers, and to reduce freight rates; a revised system of taxation which based the assessments of railroads on a level with general property; the enactment of a state civil service law that robbed the political plunder-bund of its power and made service and merit the yardstick for preferment in administrative positions.

Then La Follette left the state to represent the commonwealth as United States Senator at Washington. And in Washington he has been performing very much as he did in Wisconsin. Time and again, he has stood as a lone fighter for his reforms. He opposed our entrance into the war, fought the enactment of a conscription act, but ended in voting for most of the soldier legislation.

Still more recently, he has joined with senators Norris, Ladd, Borah, Capper, Brookhart and others in forming a farm bloc to defeat Congressional legislation deemed by them inimical to the agricultural interests.

After La Follette went to Washington, Wisconsin continued to carry on in a Progressive way. The railroad commission was given supervision of public utilities and half a million dollars in preferential rate schedules were wiped out in a single year; and an industrial commission was created to look after the interests of unemployed and injured workmen. More than $2,950,000 was paid in claims to 15,852 injured workmen during the past year; a total of $17,140,181 in the eleven years the law has been in force. New ground was gained for pure food control; a market commission was created to aid co-operative enterprises, and to bring the producer and consumer closer together, and $15,000,000 was voted to pay bonuses and provide educational opportunities to the 125,000 who were called into the World War service from Wisconsin.

Although a six-year Conservative administration intervened, just before and during the war, not a single Progressive law was repealed, but some additional advances were made. A post-war legislature censured Senator La Follette for his war attitude. This legislative condemnation was made one of the planks of the opposition to Senator La Follette, when he came up for re-election in the autumn of 1922. The people were asked to approve the legislative censure by their votes. La Follette won over his primary opponent by a three-to-one vote and was elected over the Democratic opposition by 301,465 majority.

All of this happened two years after President Harding had swept the state by 498,000, a majority of 185,000 over his Democratic presidential opponent. Sentiment for President Harding has waned in the state as it did over Taft's administration in 1912. In two years there has scarcely been an important measure upon which President Harding and Senator La Follette have agreed.

Here are some of the issues that turned Wisconsin from President Harding two years ago.

President Harding favors the Esch-Cummins transportation act. Senator La Follette made this one of the prime issues of the campaign and almost by a unanimous vote the Wisconsin legislature has this year petitioned its repeal. Every Wisconsin Congressman, including Mr. Esch, the joint author of the measure, who voted for the law, has been defeated.

President Harding has favored the ship subsidy measure. Senator La Follette has been in opposition denouncing the plan as one to "give the government ships to the private shipping monopoly and pay it a fat subsidy to operate them." Congress has blocked the plan.

State Capitol, Madison, Wisconsin.

President Harding favors the recent tariff act. Senator La Follette made this issue a part of his state campaign declaring "unalterable opposition to any tariff rate in excess of the difference in the cost of production at home and abroad."

President Harding delayed action in the face of a menace from coal shortage. There is scarcely a state in the Northwest that has not denounced this dilatoriness. The Wisconsin legislature has gone on record favoring government operation of the mines.

These are but a few of the things that mark the line of cleavage. The Progressives of Wisconsin won last fall, demanding the enactment of a law taxing excess profits; immediate increase of Federal inheritance tax rates upon great estates to be applied on the war debt; abolition of all gratuities to railroads and other interests; publicity of all income-tax returns, both state and Federal; condemnation of the "present excessive expenditures for military and naval purposes"; unalterable opposition to universal military training; amendment to the Federal Constitution to meet the recent decision of the Supreme Court nullifying the child labor law; abolition of the use of the injunction in disputes between employer and employe, and declaring for the right of the farmers and industrial workers to organize and bargain collectively, and to conduct such co-operative enterprises as they require for their protection.

This is the program of so-called Wisconsin "radicalism" that some of the papers in the state, and more outside the state, talk so much about. *Wisconsin is a Republican state, but it is not the Republicanism of President Harding.* It is a Progressive Republicanism that has been fostered, nursed and reared to maturity during thirty years through the untiring efforts of Senator La Follette.

So many epithets have been hurled at Senator La Follette that one who tells of his work in the state, of his political control, is quickly branded as a partisan. I have known him for twenty years; known the men who have fought him and who have at times gained temporary triumphs over him. His prestige was dimmed during the war. Now, as far as Senator La Follette is concerned, he has staged a "comeback" in Wisconsin.

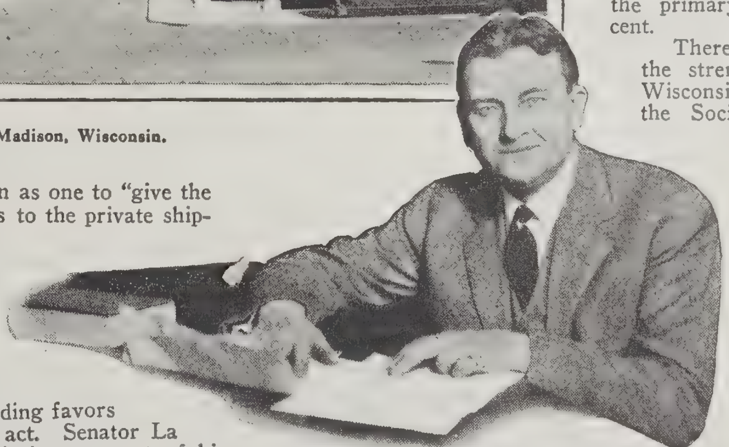
A powerful political combination has been reared in Wisconsin—one United States Senator, the governor, state officers, a majority of the legislature, nine of the eleven members of Congress are teaming together.

Four years ago, Senator La Follette endorsed John J. Blaine, a clean-cut, young country lawyer, with experience as a state senator, for governor. Blaine won. This victory marked the rebuilding of the Progressive forces in Wisconsin after having been out of state power for six years. In the summer and autumn of 1922, Senator La Follette and Governor Blaine joined forces, both candidates for re-election, and there wasn't a hamlet of 1,000 or over that did not hear one or the other. And ninety-nine out of every hundred of these communities gave them a splendid majority.

The governor made nearly three hundred speeches; the Senator made nearly one hundred. Of the fifty daily papers in the state all but three were lined up against them. The more the opposition, it seemed, the larger the crowds.

Nor did La Follette have Federal patronage to aid him. The plums have been distributed by his opponents. He has had little money but his friends have come to his assistance. All that he asked was sufficient funds to distribute literature and an automobile to carry him from city to hamlet. He had his magazine, with a national circulation of 50,000, which for fourteen years has industriously spread the Progressive doctrine. And as an orator on the stump, the Senator has a way of saying things in his speeches that make good reading even in the opposition press.

In the history of the state there has never been such an educational campaign. So great was the interest either for or against the La Follette-Blaine ticket that at the primary Democrats deserted their party in a body. Its party candidates received in the primary less than the ten per cent of the previous party strength necessary to get on the ballot. For the first time in seventy years, the Democratic party organization, which had swept the state with Wilson presidential electors in 1912, was not able to get on the official ballot. To encourage its livelihood, the legislature has since reduced the primary percentage to five per cent.



GOVERNOR JOHN J. BLAINE

There is always much talk about the strength of the Socialists in Wisconsin. In the last campaign the Socialist party polled 39,570 votes, and of these 33,103 votes were cast in Milwaukee. Its legislative representation and one representative in Congress are from Milwaukee, the big industrial metropolis of the state.

But the Socialists elected to the Wisconsin legislature this year came with a new program. Their leader announced on the opening day of the session that their party did not come as a partisan organization, but, like John the Baptist, joining with those who would offer benefits to the masses. In forcing a reform program through the legislature their strength has been uniformly thrown with the Progressive Republicans.

These comminglings of "radical" elements have brought some distinct shocks. Militarism has been a target. Wisconsin has voted to reduce its National Guard by about fifty per cent and has cut the annual appropriation of the state for militarism from $600,000 to $255,000. Before the war, it was less than $200,000. It has discontinued compulsory military training at the University of Wisconsin where it had been a part of the curriculum for fifty years.

It has been free in giving advice to Congress on matters of national concern. It wants legislation passed that will prohibit the fiscal agent of a foreign government from contributing to a national presidential campaign fund. This is a left-handed insinuation at President Harding, whose campaign managers are alleged to have accepted money from the Morgan interests in 1920 to conduct a campaign. Congress is advised that Wisconsin wants the Federal Reserve Act amended to prohibit branch banking; that it desires candidates for President and Vice-President to be nominated by direct primaries instead of by conventions, and it demands that the statutes be changed so that newly elected Congressmen take their seats immediately after election, instead of waiting a year as under the present laws. It wants Federal inheritance tax rates so adjusted that "not more than $1,000,000 shall pass to the heirs" and that

(*Concluded on page 15*)

Fifteen Million More for "Current Expenses"

Ohioans in Open Revolt Against Tax Spenders Who Are Denied Additional Funds by Own Communities

By EMERSON ROBINSON

IT WAS in the closing hours of the session of the legislature of Ohio. The recess taken to permit the governor to scrutinize, sign, veto, or allow to become law by default such measures as he desired, had ended.

The majority, the overwhelming majority, was in caucus, debating the advisability of passing over a veto a bill known as the Taft Tax Bill, after the author, Robert A. Taft, of Cincinnati, a son of the former President and now Chief Justice W. H. Taft. This bill increased the tax rate maximum and was designed, so it was claimed, to give relief to hard-pressed municipal officials, thereby increasing the already too onerous burden of the small taxpayer.

Sentiment when the lawmakers had returned to the capital was largely in favor of permitting the veto to stand and to place on the head of the governor, who happened to be of the opposite political faith, responsibility for any distress which cities might experience.

But sentiment changed overnight. Mysterious political influences, or rather, a political boss, began to issue orders. The bill was passed over the veto.

And the story which leaked out at the capital is that Rud Hynicka, successor to George B. Cox, of Cincinnati, sitting in an office in New York, kept a telephone wire open to Columbus and gave instructions to his henchmen in the legislature to pass the Taft Bill.

Absentee landlordism was a contributing cause in the fight for Irish freedom, yet Cincinnati, like the lowly ox, calmly lowers her head and accepts the yoke of an absentee boss! Hynicka may be a legal resident of Cincinnati but his time is in New York. He's like the Gothamite who liked the metropolis so well that he spent his winters in Florida, and his summers in the Catskills.

Readers of THE DEARBORN INDEPENDENT are acquainted with the financial condition of Cincinnati. It is a fine city with many fine people and the wonder of it is, that it has been able to advance or progress as much as it has, with the tentacles of one of the most perfected political machines in America exploring the pockets of its citizens.

The machine during the last few years has not been getting sufficient lubrication; the supply of oil was running low; state laws placed a maximum on tax levies and prohibited issuance of bonds to pay current expenses. The Taft tax bill increased the tax rate in cities two mills, the maximum being seventeen mills and the additional levy to be for current expenses. The maximum in the rural districts was fixed at fourteen mills. Two mills additional on the grand tax duplicate of Cincinnati would give about $1,600,000 for current expenses! A nice sum! Sufficient to get the machine running smoothly again.

But this initial increase is not the worst feature of the bill. There's a joker. Here it is:

The seventeen mill maximum includes only sinking fund requirements on outstanding bonds except those voted by the people; it *excludes* all future bond issues and interest.

What Five Years Will Bring

AT HAMILTON, twenty-five miles north of Cincinnati, the tax rate this year, according to the mayor, will be $23 a thousand. Experts have figured that this joker in the Taft Bill will, within five years, shoot the rate up to $30.

It remains to be seen whether the voters of Ohio are willing to wear the same yoke which Hynicka has so successfully kept on Cincinnati. Fortunately the state has the referendum, giving the people the right to vote on any except emergency laws.

No sooner had the legislature passed the bill over the governor's veto, than a movement was started to get an expression from the voters on it. It was felt that the subject was proper dealing for the Ohio Association of Real Estate Boards, of which John E. McCrehen, of Columbus, is president. A committee of the realtors met and determined to abide by a decision of the local boards throughout the state. The voting started. Mr. McCrehen announced that the majority was five to one for the referendum on the reports received. The Cincinnati board met. Individuals were opposed to the tax bill but the plea was made that the referendum should be killed because Cincinnati needed the money. The Cincinnati men voted against the referendum. Mr. McCrehen announced that the ratio in favor of submission was being continued. Then something happened. All of the facts have not been made public; perhaps they never will be.

A meeting of the executive committee of the real estate boards was suddenly called for Columbus. Cincinnati men were there to fight the referendum.

The report was circulated freely that the attempt to get a referendum was to be abandoned. Governor Donahey heard of it. He wrote a letter to Mr. McCrehen, a characteristic Donahey letter, urging the real estate board to proceed vigorously with the movement and pledging every support he could give to make it a success. "The trouble with the Taft bill," wrote the governor, "is that it automatically gives the tax spender in all villages and cities the right to boost rates without the protective security of any expression from the taxpayers themselves."

The committee meeting was secret; those attending were reticent and simultaneous with the announcement the following morning that hope had faded for a vote, sponsored by the realtors, came an announcement that other organizations would take it up if necessary.

There were rumors aplenty that the same mysterious influences which passed the bill had invaded the realty committee, but this was without foundation; the members had not been "reached," and on Sunday morning, June ninth, the taxpayers read with pleasure that the referendum had been decreed by the real estate board.

It is not a political fight; it is the open revolt of the taxpayers against the tax spenders, especially the tax spenders in the cities. They were denied additional funds from their own communities and sought through the medium of a state law to dig deeper into the pockets of the public.

Other organizations sprang immediately to the support of the referendum and offered to circulate petitions without cost. The governor said he would get 500 signatures; only 100,000 are needed.

The organized teachers of the state are among those who have joined in the fight.

It has been hinted that suit may be filed in the Supreme Court to test the validity of the referendum, but no action toward this end has yet been taken. Incidentally it was announced that Cincinnati would submit a proposal to vote an extra levy for the city alone with the proviso that it would not be used if the Taft referendum failed.

Economy Not Known

THE bill if it becomes a law will increase taxes for current expenses $15,000,000 a year, it has been conservatively estimated. And each succeeding year will see an additional increase as bonds and interest on issues without the seventeen mill limitation come due.

There is something radically wrong with the taxation system in Ohio; it is archaic; it is nearing the single tax in practice. The small home owner, the farmer—real estate—is bearing an unjust share of the public expense while billions of intangibles escape taxation. But the situation would be relieved, conditions would be much better, if those placed in positions of responsibility knew and practiced economy. The word apparently is foreign. It does not fit in with politics, neither in Cincinnati nor most other cities.

And the money is spent in the name of progress. One hears so much of "progressive cities" that he tires of it. If a property holder opposes a bond issue for a park, he is marked as an enemy of progress; if he points out the errors of bond issues, he is an outcast—he is against progress. Progress! progress! Officials, who use it as a cloak to inefficiency and extravagance, should get a new record!

Marion, home of President Harding, came popping into print with her tale of woe recently. Marion is broke and the officeholders and the police and the firemen and the city employes know not when the grocer and the butcher will cast an unwelcome eye toward them and the landlord invite them to get new quarters. The treasury is empty and credit exhausted.

Officials of Marion confess that there are several causes for the critical situation which confronted them in June. In the first place, they maintain that the city has grown rapidly, from 18,000 to 32,000 in twelve years and that property valuations and income have not kept pace. The tax duplicate is approximately $36,000,000; there hasn't been much of an increase in ten years because there has been no reappraisal of real estate in Ohio. And there are individual cases where property worth half a million, more or less, is only paying tax for a fifth or a quarter of that sum.

And according to the latest figures Marion's debt practically is ten per cent of the duplicate, about $3,400,000.

Marion in Bad Shape

IT WOULD seem that officials five or more years ago could easily have foreseen the difficulty of Marion today. Many, nearly all, Ohio cities were clamoring for more money, and the legislature was the object of the call. They had forgotten the word economy. In desperation and for want of a better way out, a bill authorizing cities to issue bonds to pay current expenses was passed. Marion, like nearly all the rest, took advantage of the bills and kept on spending.

And today, of the total indebtedness, close to $400,000 represents what was borrowed to pay for the day-to-day activities of the town.

This debt has been contracted within the last four years. Marion could get along now if she could borrow; but she can't. Even an Ohio legislature was able to see that the policy of borrowing to pay running expenses was extremely poor policy and decreed that the practice should stop this coming January 1. And Marion can't borrow. The banks have shut down, for the tax distribution scheduled for August and supposed to carry the city along until the distribution early next year has been pledged. Bonding companies refuse to purchase issues for operation of the city. The mayor has rejected an occupational tax which was expected to make up a deficit of $60,000 on the year because he declared it would be a hardship on the workingman.

It costs Marion about $270,000 a year to operate. The tax duplicate with the full allotment provided under the law would not give her more than $185,000 and she has for years faced a deficit of from $70,000 to $90,000 and the deficit has always been paid—by bonds. Now the bonds, or some of them, are falling due—the interest charges must be paid, and it takes about $14,000 a month to pay the interest alone.

Some of the indebtedness is represented by the policy of improving streets where abutting property was not valuable enough to pay the assessment and the burden was saddled on the city.

But Marion must progress!

She can't close up shop and quit business, so some way will have to be devised to carry on. Perhaps the employes will work and then sue for wages. That's one way. Perhaps patriotic business men will take a chance on more bonds.

The Cincinnati *Enquirer*, one of the country's greatest newspapers, often rears right up and tells a thing or two and the following gives the viewpoint of Ohio's taxpayers:

"There are cities in Ohio that can get along without the Taft Bill. Take Ironton, for example, which was out at the elbows and frazzled at the shoetops only a short time ago, with a suit against it for wages of policemen. It got along by paying attention to business rather than playing politics. Its example is cited to the other cities that are suffering.

"Further down the Ohio is Portsmouth, growing like a mushroom but not possessed of a fungus growth. The two cities . . . . have mayors who can understand figures and know that budgets must be balanced even if it is unpleasant. Very likely the budget balancers—Mayor Earl E. Stewart, of Ironton, and Mayor William N. Gableman, of Portsmouth—will offer themselves for re-election and give to the voters an opportunity to pass on their merits . . . . Stewart found his city running behind like a slow clock. In four years it had issued $100 000 in deficiency bonds and was the butt of many malicious jokes.

"So Stewart sailed in to make the cloth fit. He cut water works operating expenses from $57,000 to $44,000 a year. He combined jobs right and left and made health and fire department work together apparently on the theory that fire prevention both here and hereafter was a desirable thing.

"While political jobs in the health department were reduced, the mayor added a health nurse as a necessity and not a luxury. The firemen, it was found, who could locate a menace to life and safety, proved themselves to be adept in locating dangers to health, as experience demonstrated.

"Pursuing his policy to save money in other fields, the mayor made one job holder grow where three grew before, joining the service, safety and street commissioner positions. He made his one man so busy he forgot about politics and went to fixing streets, patching 2,000 holes in a year."

People Lack Confidence

THAT is what can be done when the city official makes up his mind to stop playing politics for the benefit of the machine or for personal profit and to do the job for which he has been elected. It may have been good politics a few years ago to spend all the law allowed and ask for more in the form of bond issues. It isn't now. The people are watching their pocketbooks and they are watching the tax spenders.

In some sections of Ohio, and the same situation may hold good in other parts of the country, the people wouldn't approve a bond issue to rebuild an orphanage! Here's an example. In one of the southern counties last September, there was an unusual rainfall and swollen creeks washed out more than a score of bridges, many small, a few large, and one unusually large, so large that to replace it, it was necessary to go before the people for permission to issue bonds to build it. The bridge was in an important section of the county and on the main road connecting the county seat and a large village. It was a necessary bridge and was generally recognized as such.

There was apparently no opposition to it from any part of the county. All of the newspapers supported it and carried articles pointing out its necessity. When the votes were counted, it was found that the bond issue had been defeated overwhelmingly. It was not defeated because it was not a needed repair, but it was defeated because the people lacked confidence in their officials and further because they were tired of continually being asked to vote additional funds.

Incidentally, a way was found later to build the bridge. It was "discovered" that it was not absolutely necessary to ask public permission to spend the money.

Now it is generally accepted that the Taft tax boost bill will be defeated. Even its supporters do not believe the people will be foolish enough to vote an additional tax on themselves.

It also is generally accepted that the state cannot go on under the present taxing system for another ten years. If it does, every community will be bankrupt, as figures given below will indicate.

There should be an adjustment of real estate values for the benefit of the taxpayers; not for the benefit of the tax spender. One of the objections raised to a general 100 per cent reappraisement is that it will increase, or tend to increase the demands of officials for more money for current expenses.

The tax duplicate is shrinking, shrinking rapidly,

Richest Town Strives for Ideal Community

Merion, Pennsylvania, Does Much to Keep City a Place of Beauty

By WILLIAM A. M'GARRY

THE richest town in the United States has just completed the tenth year of an experiment designed to prove that ideal living conditions are cheap when they are purchased, so to speak, on a community basis. The town is Merion, a division of Lower Merion Township, on the main line of the Pennsylvania Railroad a few miles west of Philadelphia. If what has been done there had been accomplished merely by the lavish use of money, with which its citizens were plentifully supplied, there would be nothing extraordinary about it and no object lesson for other communities without so much wealth. But Merion has taken ten years to do what it might have finished in one, to show that money is not the sole necessity to create an ideal American community. And during all that period it has kept expenditures within limits that could be met without hardship by the average town or village of the same size, at least on a relative basis.

So many improvements have been brought about in that period at Merion that it is difficult to choose any one as most important. The element of safety, however, certainly falls into that category. And in that connection the activities of the Merion Civic Association, with 515 members, have virtually eliminated burglaries, theft, epidemics of disease, fires and automobile accidents, to give but a partial list. For several years not a burglary was reported within the limits of the town. Even during the unsettled conditions after the war, when crime increased everywhere, and in spite of the fact that the wealth of its residents makes it a shining mark for criminals, there were only two burglaries in the twelve months—and the perpetrator was caught in each instance and sent to jail.

The association was founded in 1913. At that time it had little more than a motto as its aim—"To be nation right and state right we must first be community right." A few years later the late Colonel Theodore Roosevelt visited Merion to study the methods of its civic association and declared it to be "a model in civic matters." Still later the late Dr. Lyman Abbott said that "Merion may standardize ideal suburban life, certainly for Philadelphia, possibly for the United States." But the best short cut to an understanding of what the Merion Civic Association is trying to do is furnished by the following extract from one of its annual reports:

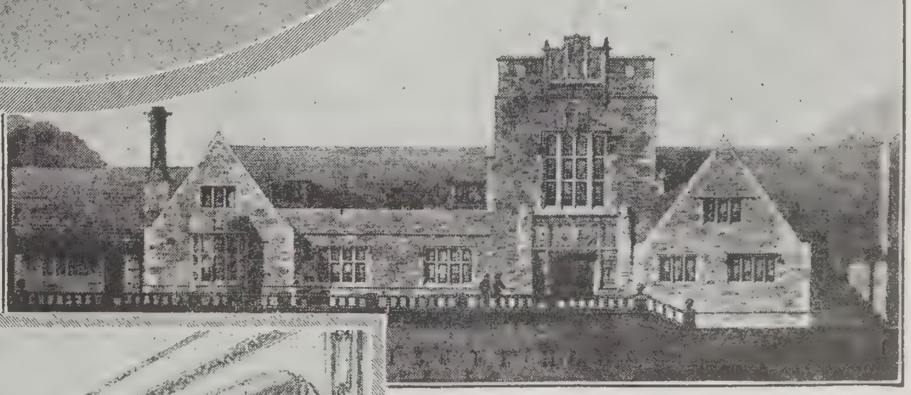
"You have doubtless noticed," said this address to the citizens, "that from the recent tax returns of Lower Merion Township as published in the newspapers, this township was adjudged as being the wealthiest territory of equal area in the United States, and that of this area of wealth, the community of Merion itself was found to be the wealthiest district in the township based upon the real and personal property tax return of its residents. I do not dwell on this statement in a boastful sense, for I do not consider that the possession of money is a basis for pride of any sort. I call your attention to it because of the added responsibility that it places upon our community and more directly upon your association.

"The only real meaning there is in the possession of a large income is the moral and civic recognition of the responsibilities that such an income carries with it. It will be no credit to Merion to be known as the wealthiest community on the Main Line unless it is also equally well known as the community that does most with its wealth in the discharge of its civic responsibilities. 'From those to whom much is given, much is expected.'"

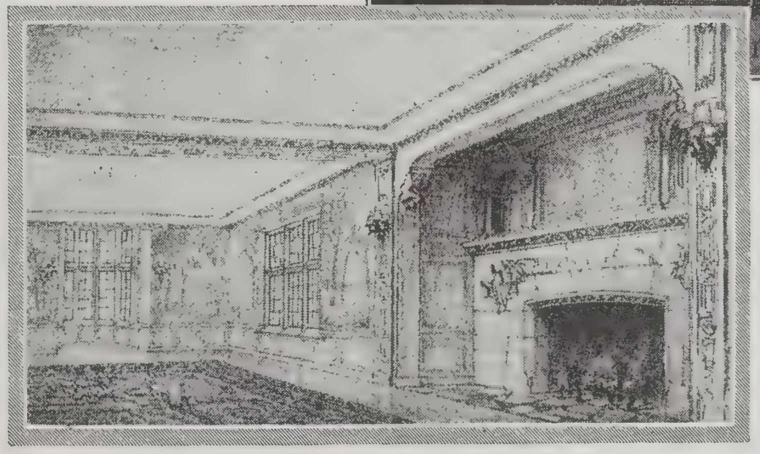
A great deal of what has been done for the town through the efforts of the association is the result of a common-sense effort to make life safer and more livable for all. The association goes in for good roads, but at the same time it goes in for economical roads. Fire insurance rates in the town have been reduced in amounts ranging from twelve and a half to thirty per cent, through the arrangements made with fire companies and the fact that the roads are always open. Also, no house in the town is more than 700 feet from a fire hydrant, and pressure is always assured. All new roads are laid from curb to curb, thus eliminating the expense of gutters and making it easier to keep the thoroughfare cleaned, and the same plan is being put into effect on all the old roads. As a result, they last longer. Some of the practical advantages of life in Merion are summed up by the association in its answer to the question, "What do I get for being a member?" as follows:

"The most complete and vigilant police protective service of any neighborhood suburb; a special surveillance, upon request, of your house when you leave it for a day or a night, or for any length of time, or when any member of the family is left alone; a special police whistle, which when used, night or day, summons immediate assistance; the most adequate fire hydrant system of any neighboring suburb, and a regular inspection of the efficiency of the hydrants; the benefit of a special arrangement to call any or all of five fire engine companies, city and suburb; a regular monthly analysis of the purity of the drinking water, and authoritative inspection of the source and standards of the milk supply; a special low rate of fire and burglary insurance; the best help or effort, always at call, in any neighborhood problem that may arise where the association or its secretary can serve; your part of the benefit of the new station, the new post office, the new roadbeds, the cleaning and oiling of the roads, the lights and roadsigns, all inspired or carried out by the association."

Highland avenue, Merion, free of telephone and light poles, paved from curb to curb.



Architects' drawing of Merion War Tribute house as it will look on completion, front view; showing terrace.



Architects' drawing of a corner of the tea room as it will look in the Merion War Tribute house.

It is a matter of record that the great majority of automobile accidents in country districts are at crossings. Merion recognized that fact several years ago and started a campaign to have property owners set back fences and hedges at road junctions to give motorists a clear view. In line with the same policy, the association has had 213 electric lights installed. The lamps were especially designed for beauty and utility. When the association was formed, there were many toll roads, all of which have been abolished. For ten years a leading feature of the work has been a fight to eliminate telegraph and electric light poles, with the result that there are fewer in Merion than in any similar suburban community. Most poles still standing are set in the back yards, so that there is nothing to disfigure the beauty of the tree-shaded roads.

The landscape activities of the association have been unusually successful. Many who know of its work had their attention called to it first while passing through the community on through trains. For a stretch of more than a mile, the Pennsylvania Railroad tracks run between banks of gorgeous bloom from spring until autumn. The association got permission to beautify the embankments, which are rather high in spots and had been unsightly. Its first move was to plant red roses, but they soon became so thick that engineers complained that they mixed up the signals. Then they were mixed with white roses and a wide variety of other flowers, so that there is always something in bloom during the growing seasons.

About two years ago the association began to make regular inspection of all trees, whether on the highways or on private property, and this has resulted in the saving of many landmarks. The following from the report of the tenth annual meeting, just published, is a typical example of what the association is willing to do to keep its roads beautiful:

"One of the outstanding achievements of the year was the forestalling of the removal of the row of fifty-eight trees on the Wynnewood avenue front of the St. Charles Seminary. Many of these trees are more than a hundred years old, and they are among the most beautiful shade trees in Merion. The seminary authorities had contracted for the cutting down of this row on the recommendation of an engineer, who reported them to be in such bad condition that they could live only a few years longer. This proposed destruction was not heard of by your association until the work was begun and two trees were cut. The association then arranged for the inspection of the trees by a nursery, which reported that they were well worth saving, and submitted an estimate of $600 for trimming and treating them. A conference was held with the seminary authorities, who agreed to bear one-third of the cost of treating them, the remaining two-thirds being shared equally between the association and the residents of the avenue. Within a few days the tree surgeons were on the ground and they have now put the trees into good condition, thereby lengthening their lives perhaps by a generation."

Every year the association conducts a fly and mosquito campaign, the total cost of which is about $100. Boy Scouts do much of the work, making lists of places where the pests may breed. The scouts also take a direct hand in a great deal of other work. This year they painted all the road, danger, and boundary signs, lamps, water standpipes, refuse cans, fire gongs and bulletin boards in the town, the total cost to the association being $198.95 plus the price of materials. Merion claims to be the first American community to establish a permanent Red Cross house. It will soon have a War Tribute house equal to any in the country, and on the same estate it now has a permanent home for its Boy Scout troops.

The tribute house was first planned early in the war, and by various contributions a fund of $80,000 was raised. Then, when the association was looking around for a site, Eldridge R. Johnson donated his fourteen-acre estate and agreed to pay the cost of the building. This is now nearing completion. It will be available for all sorts of social and community activities. One wing will be devoted exclusively to the uses of the American Legion. The main room is to be an auditorium thirty-eight by fifty-five feet, with space for an organ. In that connection a special study has been made of acoustics and the construction of the walls is said to represent a new departure in sound distribution. Walter T. Karcher, the architect, in describing the rather unusual methods of construction, says:

"An interesting thing about this building is that all the stone is hewn on the ground. This is very unusual,

(Concluded on page 15)

Advertisers Have Taken Over Our Newspapers

Service to the Public Forgotten by Publishers in Scramble to Make Known Their Worth as Advertising Medium

By a Newspaperman

THE ideal newspaper should be a mirror, reflecting for the public incidents of news interest in that proportion and with that degree of intensity that the incidents warrant.

Far too often, however, the newspaper is a magnifying glass.

And in the present state of American newspaperdom, where virtually every paper in the country is a highly developed instrument for the dissemination of propaganda, it frequently is a prismatic lens, coloring such news matter as filters through with the bright hues and peculiar rays desired by the particular publisher.

To the average reader the daily newspaper is an inanimate mass of type, delivered to him by the corner news stand or his neighborhood newsboy—a thick, rather unwieldy collection of printed matter wherein he can learn of the attempted assassination of the prime minster of Bulgaria a few hours before, or can glean the sordid, gruesome details of the latest murder scandal.

He does not glance behind the scenes to see the living, breathing humans who sweat out their lives to provide him with his evening's entertainment and information; he seldom thinks of the personalities behind the news any more than his mind dwells on the ingredients that go into the sausage. Yet those personalities who throw the raw news matter into the hopper that grinds them out as a finished newspaper, those personalities with their loves and their hates, their motives and their designs, must be minutely considered if one would understand the functioning of modern newspapers.

The Big Advertiser Rules

THERE is the reporter, he who spends his life in search of news, the new and the unusual, and who pours his whole soul into his work that you may learn at your ease of the happenings of the world; the reporter who writes his stories as interestingly and as truthfully as he can and yet conform to the "policy" of his newspaper. Back of him is the city editor and the other brands of executives who correct, change or expunge the reporter's copy. These are the direct representatives of the publisher, and after the "news" leaves their hands it can be depended upon not to give offense to his mighty majesty.

And behind the publisher looms the bulky form of the big advertiser.

Originally the sole function of the newspaper was to print the news, and its sole effort was to serve the public and thus constitute itself a great machine for the public weal. Horace Greeley and Charles A. Dana are splendid examples of the type of men who put out this kind of a newspaper, and during their lives their influence was tremendous; for it was known that the columns of their newspapers were not for sale.

Then some bright mind conceived the idea of selling space in his paper to outsiders to tell of their own products, and gradually advertising became a more and more important feature until now it virtually rules the press of the country and tinctures even the news columns themselves, hitherto sacred.

Notice the advertisements in which the large newspapers praise themselves. Do they extoll their news and editorial columns, or do they dwell upon the sublime advantages of the paper as an advertising medium?

The Tribune "Dominates"

I HAVE in front of me an advertisement by the esteemed Chicago *Tribune*, self-styled "World's Greatest Newspaper," printed in the Philadelphia *Public Ledger* February 15. Not one word is said about the *Tribune* as a news gathering and publishing agency, nor is it mentioned as an institution to serve the public. On the contrary, the *Tribune* does not "serve," it "dominates." Witness this:

"Here . . . . are 137 cities and towns of 5,000 population and over, and each dominated by the Chicago *Tribune*."

Service to the public is not mentioned.

A modern metropolitan newspaper cannot exist without advertising. So vast are the functions and activities that, were all advertising withdrawn, the newspaper would collapse in an instant like a deflated balloon. Is it any wonder, then, that the big advertiser looms like some medieval ogre behind the columns of your newspaper; that the publisher lives in mortal fear of him and bends to his will?

The Constitution of the United States guarantees the freedom of the press; that is, it specifically protects newspapers from abridgment by Congress. But it makes no mention of interference by advertisers!

The newspapers conceived and reared their own monster and, like Frankenstein, are being devoured by it.

The reader can readily perceive that to obtain a clear understanding of the *modus operandi* of modern newspapers, he must first gain some knowledge of the three main personalities behind the news: the reporter, the publisher and the big advertiser.

The tribe of reporters is a numerous one, and, like all other tribes, it has its conflicting and opposing members. We will take the average type, he who is neither a genius nor a hack, and attempt to dissect him so that you may have a better and perhaps a more sympathetic conception of him.

As a rule he is an alert, bright young chap, attracted to the newspaper "game" by the love of excitement and the allure of self-expression, sacrificing many things, money, health and, yes, even life itself, that he may worship before the altar of his great deity, news. He is well-read, thoroughly alive, active, ingenious. His very life gives him a keen insight into the scheme of things. One day he will be interviewing a great novelist, the next tracking a murderer, the next chatting with a senator.

Yet in spite of these many attributes, your reporter is a cynic. Do not gather from that that he is filled with the sophomoric cynicism and boredom common to the college undergraduate who oozes worldliness and disillusionment.

"Never let the facts interfere with a good story," runs an old newspaper adage. It has been changed in recent years: "Never let the truth interfere with a 'policy' story."

Few people realize just what a "policy" story is. Let us illustrate: The editor of the Dingville *Democrat*, or the New York *Mercury*, for that matter, is a rabid anti-prohibitionist. In the editorial columns of his paper he hurls fiery darts at the drys in a perfectly legitimate manner, according to best newspaper ethics.

But, and here is where the harmful part comes in, every man on the paper knows that the sheet is wet to the core. There may be no orders issued; possibly there is just a tacit understanding; but everyone, from the editor-in-chief down to the humblest copy boy, knows what is expected of him. Every story casting discredit upon prohibition, every tale that reflects on the character or integrity of a dry leader, every trivial incident tending to show that the Eighteenth Amendment is a failure, is played to the limit, exaggerated, "colored," displayed in unwarrantedly large type.

The news columns of the paper are used to further its editorial policy, and the propaganda is dished up to *you* under the guise of news.

Do you blame the reporter for being a cynic? But the real danger to the *tribus reportibus* lies not in his cynicism, but in the fact that hundreds of old-time reporters are forced to desert their chosen calling every year for more lucrative fields, while their ranks are being filled with incompetent, inferior, "Chinese labor."

Editorial Wage Scale Low

THE wage scale for reporters is so low as to be ludicrous. Reporters, copy readers, and lesser editors are paid on an average of $5 to $10 a week less than the mechanical laborers, the printers and the pressmen on their own papers. In a large Pacific Coast city a well-read, well-educated man, Scotch by birth, worked on the same newspaper for nearly twenty-five years. At the end of that time he occupied the double position of music editor and book reviewer, receiving the munificent sum of $32.50 a week for his labors. The publisher of this paper died recently leaving an estate valued at $8,000,000.

The average reporter's salary in nearly every city in the country is $35 a week. Seldom does it go higher than $40, often it sinks to $25. An astonishingly low scale exists in New York largely because of the influx there of bright young reporters from every part of the United States with the resultant glutting of the market. The same condition prevails in Los Angeles.

In many cases reporters are paid less than unskilled day laborers. In virtually every case they are paid less than the organized mechanical laborers on their own newspapers. Printers and pressmen receive from $45 to $50 a week upward, on an eight-hour day.

The low salaries, by the way, prevail even among the executives of newspapers. The managing editor of one of the largest newspapers on the Pacific Coast, a man who holds a position ranking with that of directing head of the largest concerns of the city, receives only $80 a week, slightly more than his own shop foreman.

We have considered one or two "policy" stories as they affect the reporter. Let's consider some in regard to the publisher. Purely propagandist stories have become of such common occurrence as to cause little or no comment.

Recently the editor of a large western newspaper decided to oppose an income tax bill then under consideration by the state legislature. He sent his reporters broadcast over the city, each reporter to bring back ten short interviews on the proposed measure. The reporters knew their business; of course they did.

Of the 200 or 300 interviews printed next day, only one favored the bill; all the rest attacked it vigorously, with names, occupations and addresses all neatly tacked on. Yet that story, which only a vivid stretch of the imagination could term "news," was played under a large headline in the coveted right-hand column of the first page.

The owner of a large eastern newspaper is antagonistic in the extreme toward a prominent banker for personal reasons. Everything casting discredit upon this financier, from stories tending to show that he is hindering the development of the city to articles attacking by innuendo his relationship with municipal funds, is played prominently in this newspaper, which by the way has aspirations to be a national publication. The paper, otherwise a good one, is permeated with this petty spite work to such an extent that it is a standing joke in the community.

Propaganda however is by no means confined to publishers alone. There are the great news-carrying agencies (every Hearst wire breathes forth Hearstian doctrines); the special writers who coat various propagandist stories in a sugary covering of fine writing; the press agents, now shed of their old-time garments and blossomed forth as "exploitation experts." What can justify from a news standpoint the intolerable drivel concerning the so-called motion picture stars of which the newspapers carry reams every Sunday? True, the exhibitors carry big advertisements; but that brings us to the third ingredient in our news hopper, and by far the most sinister.

We noticed that one of the big Pacific Coast dailies, once regarded as the premier paper of the West, never carried a real criticism of a motion picture show. Every review, if we may apply that term to the articles printed by the paper, consisted of sickening, saccharine superlatives almost equal to those of the movie press agents themselves. We asked the motion picture editor about it.

"Write a real review about a movie?" he queried in surprise. "Don't you realize that the ———— & ———— outfit (the local exhibitors' trust) pays the paper more than $50,000 a year? We would no more think of roasting one of their shows than we would of attacking Holy Scriptures."

One Paper Prints This Story

ANOTHER example, more tragic, is that of an old-line eastern paper that once nurtured some of the greatest news writers in the country in its bosom, a paper on which Richard Harding Davis received his early training. It is a sample of the Old Man of the Sea throttle-hold advertisers have on modern newspapers.

Shortly after the war charges of profiteering were made by the United States attorney's office against a large Jewish department store in Philadelphia. The charges, involving as they did this store, one of the best known in the country, and centering around the cost of living, vital to every resident of the city, were of prime interest and of great news value.

One Philadelphia newspaper printed the story.

The department store promptly withdrew its large advertisement from the paper, and a few months later the publication was forced to "give up the ghost." And at that the story printed was only a couple of sticks long, and was buried inside instead of being placed on the front page.

It is only justice to say that similar charges were brought against the same company in New York and that the metropolitan papers printed the story for its true news value. Later the Philadelphia papers, taking heart from the sister publications, ran stories of subsequent developments.

A score of years ago the Philadelphia *North American* waged a vigorous campaign against the various evils existing in and around the Quaker metropolis. The paper did valiant work.

But pressure is always brought to bear upon any newspaper that steps on the sacred toes of the privileged class. Not only are advertisements withdrawn, but banks politely inform the paper that long or short time loans are no longer available, inasmuch as clients or friends of the bank have been offended.

The *North American* had a hard time of it, but eventually it pulled through, and today it is still thriving and occasionally does excellent work in exposing shady financial concerns or rotten political deals.

It's the Paper That's Necessary

THERE is one case on record of which the American newspaper reading public may well be proud. During the 1912 Presidential campaign, a great eastern newspaper vigorously supported Roosevelt and as vehemently attacked Taft. One of the large department store proprietors, an intimate friend of the then President, gave orders to the publisher, so the story goes, to discontinue his attacks upon Taft.

The publisher refused, and the store's advertisement was withdrawn. Even in the face of this severe blow, and the reader can only guess at what a terrific blow it is to have a contract worth thousands upon thousands of dollars a year withdrawn on an instant's notice, the publisher refused to be coerced, and in the end the advertisement came back.

It has become a serious state of affairs when the newspapers of the country are forced to depend for success on the bulk of their advertising matter rather than on the excellence of their news columns or the value of their service to the public.

The one thing most publishers apparently do not realize is this: Whereas advertisements are necessary to the life of the newspaper, on the other hand, newspapers are essential to the life of the advertiser.

If newspaper publishers would combine and present a united front against the advertiser, they could easily combat any and all attempts at dominance.

But publishers, so it seems, prefer to leave the gentle art of combination to their printers.

Oregon Points Way to Aid Industry's Victims

Program of Rehabilitation Provides Medical Treatment and Re-training

By M. NORRIS DAVIS

TODAY, as never before, the thinking American realizes that the future of our nation depends to a great extent upon the conservation of our forests, our agricultural resources and our producing man-power. In connection with the last named, one of our western states is doing an outstanding piece of work.

During the past three years, Oregon has been carrying out a program of rebuilding the men and women who have been seriously injured in industrial accidents while under the protection of the workmen's compensation law. In this line of work, Oregon is probably more advanced than any other state, and particularly those states where the workmen's compensation insurance is distributed among casualty insurance companies and self-insuring employers. Under the exclusive state fund system prevailing in this western state, the Industrial Accident Commission has a direct interest in doing everything possible for the fullest restoration of injured men coming under its jurisdiction.

Important and gratifying have been the results of this program of physical reconstruction and vocational re-training. First, by providing for the bodily repair and rebuilding of injured men, the number of those seriously crippled from industrial accidents is being materially reduced, effecting a considerable financial saving to the state industrial fund. Second, the re-training of men for new vocations, when injuries prevent their returning to their old employment, has made these men an asset instead of a liability to their state.

That injured men and women might be restored to a condition as nearly normal as possible, the Oregon State Industrial Accident Commission has established a well-equipped physiotherapy department in connection with its offices in Portland, with a smaller branch in Salem, the capital. With one or two exceptions, it is the only department of this nature that is maintained in connection with a state.

It is not a hospital. It is a department where from seventy-five to one hundred men are receiving daily treatments—men who have been attended by their regular physicians until their condition has reached a stage where special reconstruction treatments are needed for conditions which follow serious industrial accidents.

Here stiffened or ankylosed joints, atrophied or wasted muscles, nerve injuries, back injuries and conditions following bad fractures or infections or lacerations are treated. These treatments are supervised by competent surgeons under whose direction the actual work is done by reconstruction aides who were trained for this work in the government reconstruction hospitals.

W. T. Kirk, a state commissioner for this work, told the writer that the records of this department show remarkably beneficial results in a great majority of cases.

"Naturally," he said, "it is impossible to compute in dollars and cents the saving that is being made by this work, but it can safely be said that the saving which results from cutting down time loss and reducing the amount of awards for permanent partial disability far exceeds all the expense that is attached to the department.

"But of far greater importance is the personal benefit received by the individuals who are restored to a condition of health and usefulness. There is untold satisfaction in providing the means of saving many victims of industrial accidents from being seriously crippled for life.

"Physical reconstruction work of this character is made possible by the fact that in Oregon all employers and employes under the protection of the workmen's compensation law contribute exclusively to the state fund, and, aside from the great humanitarian feature, to provide a department for giving such treatments is a direct financial saving to the state fund, and indirectly to the employers."

In January, 1920, by an act passed at a special session of the legislature, provision was made for the vocational rehabilitation of the more seriously injured workmen coming under the compensation law. This act was the direct result of the proposal made by a committee appointed by the governor to consider the needs of the injured workers. Sufficient funds are provided by law for the maintenance of this work.

With ample funds and authority, the commission undertakes the task of aiding the seriously crippled men and women to prepare for different vocations, where they may expect to continue to support themselves and their dependents.

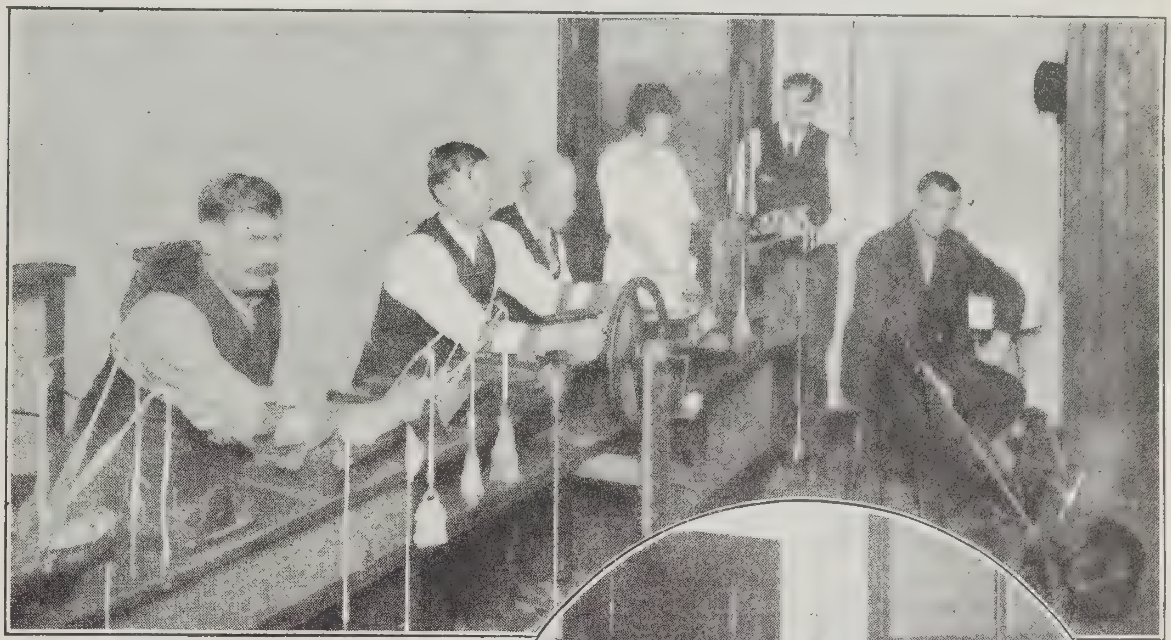
While these injured persons are in training, an allowance is made from the rehabilitation fund, which, when added to their regular compensation payments, is sufficient to meet the actual living expenses of themselves and their families. In addition, all expenses in connection with the training are paid by the commission. This provision for maintenance is an important feature of the whole rehabilitation program, and makes possible re-training in cases where otherwise nothing could be done, for not many injured workmen have means of their own to carry them along for several months, while they are acquiring a new trade or vocation.

The allowance for living expenses is fixed at a moderate figure, sufficient to meet the requirements, and yet not to constitute a temptation to a man to prolong his training period merely for the sake of the money he gets out of it. In addition to these allowances, the commission pays for all training costs such as supplies and tuition.

Various trades and vocations in which men are taking training include mechanical drawing and drafting, auto mechanics, mining and civil engineering, barbering, farm mechanics, pharmacy, different aspects of agriculture, wireless telegraphy, salesmanship, bookkeeping, stenography, candy-making and shoe repairing.

Most of the men are receiving this re-training in the different vocational schools of the state, although some are learning a trade as apprentices or under special tutors.

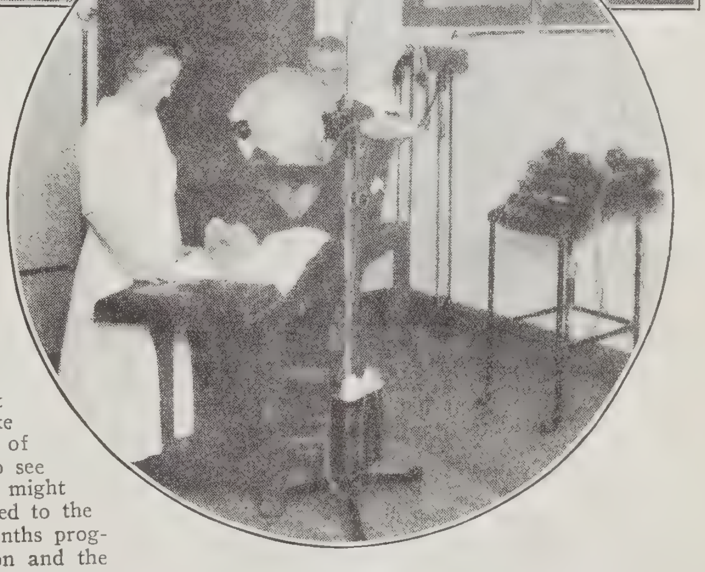
Through its director of vocational rehabilitation, the commission keeps in close touch with the injured men throughout the entire training period. This is done by personal visits and written reports.



Section of room in which is installed mechanical apparatus for forced exercises for restoring lost function.

One of the most interesting cases that has come before the commission was that of a young man whose back had been broken in a shipyard accident, and who was paralyzed from the waist down. At the time the vocational rehabilitation law was passed he had lain on a hospital cot for about a year, and when the question of fitting him for some useful occupation was first broached to him, he was too despondent to be interested. He felt that if something could not be done to make it possible for him to go about on crutches, at least, he saw nothing ahead of him to make life worth living. The surgeon in charge of the physical reconstruction work was sent to see him, and said there was a chance that he might be put on crutches, and an aide was assigned to the case to give daily treatments. In a few months progress was noted, and now, after an operation and the long period of treatments, the man is getting about on crutches. Not only that, he became interested in vocational training and selected drafting. A table was built to fit over his wheel chair, and a tutor employed. Today he is doing practical work.

When questioned as to whether men did not occasionally take advantage of the rehabilitation plan, Mr. Kirk stated that although slackers were found among these men, as in other classes, a large percentage of those to whom aid has been extended under the law have shown themselves worthy, and have done their part to make the effort worth-while. Once in a while, men are found who are grasping and critical, and who are not willing to put forth any effort of their own, assuming the attitude that the state is expected to take care of them for all time. The commission has found that the sooner such men are thrown back on their own resources, and given to understand that they cannot impose on the state, the better it is for all concerned.



In the department of physiotherapy is found complete hydrotherapy and electrotherapy equipment. Heat, massage, various types of baths, different electrical apparatus, forced and corrective exercises, all play their part in the rebuilding of men and women injured in industrial accidents.

Oregon has been the pioneer state in this particular program of reconstruction and conservation. It is to be hoped that many other states will see their way clear to make provisions for the victims of industrial accidents such as this western commonwealth has done. Such provision may indeed prove a godsend in many cases, as it lifts men from the depths of discouragement and renews hope and ambition. Wives and children may be saved from want, and untold benefit result from a wise law made in the interests of those seriously injured in the accidents which occur in industry.

"There is no set rule," explained Mr. Kirk. "No two cases are alike; each presents a different problem. In developing this work the commission has endeavored to keep as free of red tape as possible, as injured men (in many cases financially down and out because of their injuries) are in no mood for delays, and one of the first important considerations is to restore the handicapped individual to a healthy mental attitude.

"Our usual procedure is as follows:

"A questionnaire is sent to those whose injuries result in permanent disabilities which entitle them to vocational re-training if they need it. If this questionnaire, when answered, contains information that indicates the need of vocational rehabilitation, the workman is called in for a conference with a member of the commission and the director of vocational rehabilitation. The purpose of this interview is to help the man reach a solution for his particular problem. When he reaches a conclusion as to what he should and desires to do, he is at once assigned to a place for training, and starts in immediately in many cases."

FINANCE

Behind the scenes
I stand.
And move the unseen wires
Controlling
The pigmy marionettes,
Who mouth and mow
Upon the stage of public life;
I control the issues
Of life and death—
The exchanges of the world
Rise or fall
As I desire;
Men spend their lives
In ceaseless, wasteful toil,
That I may satiate my lust
For dominance.
The press is my servant;
Literature, art, and music
Are my vassals;
The capitalist is my bondsman;
Labor leaders unite
To pay me homage;
The church worships my image and superscription;
My word
Is infallible.
At my command
The nations wage war
And incarnadine the earth
With the blood of the innocent;
Peace, at my behest,
In shuddering awe
Unveils her face,
Only to flee again,
That I may reap
A richer harvest
From the grim carnage
Of industrial strife;
I am the invisible dynamo
Of incarnate power
To which
All men pay tribute;
I manipulate credit—
I am the superman.

—Percy Allott.

Millions Spent on Indians Declared Wasted

Concluded from page 6

The total cost of the herd was $367,053.46. Of this amount $61,957.84 was paid out for salaries and wages to bureau employes.

It is stated that the herd was sold at a net loss of $54,523 not counting the equipment. The loss on this one venture is more than the entire amount to the credit of the tribe in the Treasury.

The whole scheme of tribal herds and communistic property is a bureau scheme to prevent the Indians becoming Americans. It is entirely wrong in principle, even though it should be successful as a dollar and cents proposition. But what shall we say when, after investing the money of the Indians without their knowledge or consent, the bureau loses the money invested and beggars the Indians?

Remember that the main argument of the bureau officials for the continuance of their bureaucracy is the business incapacity of their ward. How did they demonstrate their efficiency?

There came a drought in the Blackfeet country and the grass failed. The supervisor in charge ordered the cattle turned into the allotments of Indians who had been endeavoring to make their own livelihoods on their own lands. Even the little hay that they had toiled to secure was eaten by the tribal herds.

Then the supervisor became panic-stricken and ordered that the cattle must be shipped out at once. They had to be dipped before they could be shipped, and this was ordered done in severe winter weather. The cattlemen dipped their cattle in the summertime, but this tribal herd, the property of the Indians, was dipped when the thermometer was thirty degrees below zero. These cattle were crowded into a liquid bath which covered them completely, and then came out of it to freeze to death.

Some of them died at once, others died on the railroad cars, but there was no recourse. The guardianship of the Indian Bureau had been exemplified once more. It was but one more illustration of the value of a system which puts the Indians, their lives and lands, their money and morals, in the hands of the Indian Bureau.

I have been told by members of the Blackfeet tribe that the cattle of this tribal herd were branded with the same brand used by a Montana stockman. Little wonder that five or six hundred head of cattle disappeared from the reservation and that no effort was made to recover them.

Fish Wolf Robe is a Blackfeet who had an allotment upon which he worked faithfully in an effort to put up enough hay to provide the necessaries of life. He had about twenty tons cured when the agency employes ran the tribal herd into his meadows. The cattle ate up his hay and left him destitute. When he complained, he was threatened with jail. He was told that the officials had leased his land for the use of the tribal herd.

He had never desired to lease his land and never received any money for a lease. But what mattered these little details? He was an Indian, who must be guarded and protected against himself!

And *this losing venture of a tribal herd stands as a mortgage against the property of the Indians.* The Indians were not consulted but they are expected to pay.

Still this tragedy of errors in regard to the tribal herd which dissipated every dollar of their tribal funds is not the greatest calamity endured by the Blackfeet.

A far greater liability is the irrigation system which has been fastened upon this reservation in violation of every vestige of common sense. The commissioner in his letter to me states that $1,095,251.15 has been spent since 1910 for irrigation on this reservation. In the last fiscal year the amount was $31,299.77. This great sum has been spent, not with the approval of the Indians whose property is mortgaged to pay for it, but over their protests.

Not even the bureau can defend the policy now. Assistant Commissioner Merritt, one of the ablest and most adroit officials who ever helped to build a bureaucracy, testified before the subcommittee of the Appropriations Committee dealing with Interior Department Bill of 1923. He said, "This irrigation project has not proved successful in the past because of climatic conditions. They sometimes have frosts in May and snows in August."

Of course the Indian Bureau only learned this habit of nature after a million dollars had been spent. For uncounted ages, this territory in the Rockies, stretching to the Canadian border, has had killing frosts in the summertime. The Indians knew it, but, of course, they are "incompetent" and must not be encouraged to offer advice to their masters.

There are 47,600 acres in that project already under irrigation. Only 2,005 acres have ever been cultivated by Indians. It cost for operation and maintenance last year $27,666 in order that a few incurably optimistic Indians might attempt to grow crops under such conditions. Fourteen dollars an acre in costs, and the Indians secured only a small fraction of that in crops!

Unless something is done, the Blackfeet Indians are doomed. They are almost at the end of the trail.

I maintain that every dollar of our Indian appropriation works an injury to the Indians, in whose name it is taken from the Treasury.

Let any one who doubts that statement compare the Chippewa Indians of Michigan with the Chippewas of Minnesota.

The Michigan Indians are not under the bureau, while their brothers of Minnesota are held securely under bureau domination. That offers a fair test. Here are the same Indians with the same ancestry and the same blood and breeding, but with different environment.

What has been the result? The Chippewas of Michigan became citizens through treaty and legislation in 1845. The last payments under the treaty were made in 1872 and they have been required to shift for themselves since that time.

They have established common schools and they are a part of the American communities where they live. They speak the English language. Though they do not have the majority of voters in the townships, Indians have been elected to all the offices within the gift of the electorate. There have been Indian school directors, supervisors and justices of the peace, while a number have held county offices. Two-thirds of them own their own homes, and there are no more paupers among them than among the white population. Out of their ranks have come ministers, lawyers and teachers. Some of them are mechanics and others are farmers. Whether in industrial cities or on the farms, they have made good in competition with all the world. They are real American citizens, of whom America may well be proud.

What of their brothers in Minnesota who have been guarded and sustained by the Indian Bureau? The 1922 law provides $95,000 for the "civilization and support" of the Chippewa Indians of Minnesota. It provides $51,000 for the support and education of Indian pupils in Indian schools. It provides $46,570 for the tuition of Indian pupils in other schools. It provides for superintendents and teachers and employes by the score to hold the reins tight over these Indians.

What has this money accomplished for the Indians? Listen to the letter sent out by the official council of the Chippewas of Minnesota, copy of which was addressed to every member of Congress within the past six months.

"As a tribe we have been dispossessed of our homes, our liberties, our lands, our wild rice beds, our wild berry fields, pure timber, our sugar bushes, our hunting and trapping grounds. Our basket making, rug and blanket weaving, beadwork and canoe making, is so imitated and cheaply manufactured by the white man that we can no longer compete. We are a people who, under the present paternal system of Indian administration, are deprived of every self-independent right, who are languishing in misery and dying of starvation."

You can call the roll of the Indian tribes of America and the response will be one great chorus of protests against the present system of control and the money distributed in a way to perpetuate the Indian Bureau.

The Indian problem will disappear when the Indian is treated as a man. All the Indians in the United States would make but one-fifth of the population of my home county. The great difficulty is that about 5,000 persons look upon the Indian question as their official pasture, where they graze at governmental expense.

The vast majority of Indians, thrown on their own resources, will make good. They will find work and do it. Fewer employes will be on the bureau payroll, but more Indians will be civilized.

Abraham Lincoln, in a message to Congress in 1864, said:

> "I submit for your special consideration whether our Indian system shall not be remodeled. Many wise and good men have impressed me that this can be profitably done."

Sixty years have passed since that recommendation. The Indian Bureau, which then was beginning to show its possibilities for evil power, has become a Frankenstein creation. For every reason that Lincoln had for remodeling the system, there are 10,000 now. The solution is simply the old-time command, "Let this people go." All Indians born within the limits of the United States should be declared citizens and entitled to all the rights, privileges and immunities of such citizens.

How America Is Helping to Save China

Concluded from page 3

generations. I myself am of the sixty-fourth generation of my family, and we have a written history running back to four centuries before the birth of Christ. The Chinese are bound by centuries of customs, and act with the greatest deliberation, whereas, in this country, actions and movements are carried out with the maximum of speed. Time is reckoned in cycles by the Chinese; in hours and minutes by Americans. The people of the western nations act on the impulse of the moment; the Chinese on the advice of their ancestors. In America, one can have his photograph taken, his shoes shined and his clothes pressed "while he waits"; in China, he would have difficulty in getting a cup of tea in so brief a time. Thus we hardly can expect to see a new republic or a new nation made out of China while we are looking at her.

But education in China today is receiving marked attention. The children leave home for school at 8:30 in the morning, and return at 4:30 in the afternoon. They are being educated along modern western lines, and before one of them is allowed to graduate from a Chinese college he or she must know English thoroughly, a four-year course in that language being required as a condition to graduation. Contrary to American collegiate custom, no time is wasted on the study of the "dead" languages. Today, more than 20,000 Chinese students are studying abroad, the majority of them in the United States and England, the English-speaking countries. More than 3,000 are in California alone.

On a recent visit to China I was a guest at a house party given by a mandarin, and attended by more than fifty others, all Chinese, at which not a word of Chinese was spoken, except to the servants, and at which we conversed, sang, danced, and even ate, using English entirely. By no means all those present had been educated, or had even lived, anywhere except in China, though a few had been trained in the United States. This brought vividly to me the desire of the Chinese people to learn and use English. In reality, China's only real friends today in the family of nations are the Americans, and we realize sometimes that you Americans feel a rather keen disappointment in our failure to establish a working republic at the first attempt. But we realize also the causes that have made success slow in coming, though it is now more than ever on the way. It is education alone—and largely technical and mechanical education—that will raise the new China to its place among the nations, and it is the part of the United States and the American people to supply that education.

China is beginning to realize—and by China I mean the great mass of the 450,000 000 people of the country in which I was born—that no nation can live by itself; that she must fit herself to enter the comity of nations, and that her problems are not hers alone, but the problems of the world. The national ideal of individualism in China is giving way to a popular ideal of nationalism, and it is these young Chinese, educated in the United States, and filled with the ideas and ideals of this great republic, that are instilling into the people of China those thoughts and principles which will one day not far distant enable her to become one of the great nations of the world.

Despite the fact that the exclusion law has become almost an extermination law, and that it has reduced the Chinese population in the United States from 150,000 in 1885 to barely 65,000 at present, the Chinese people draw their greatest inspiration from America, and look upon the United States as their greatest hope of preserving their national entity and providing their people with those educational advantages which will enable them to reorganize their government and establish their nation. I am not too sanguine, however; I am not expecting that the people of Christendom will live up to the teachings of the Christ whom they follow, but I do expect wonderful things to happen in my country, when China ultimately will be a mighty nation. There is nothing the matter with China today, except that she is out of equilibrium with the twentieth century and out of step with the modern nations. The Chinese have learned a lesson from the western nations, the lesson that might makes right and that nations are measured by the size of the "big stick" which each possesses. Give China ten years and she will be in a position to defend herself. In all history, China never had a standing army; she might have had a sitting-down or a running-off army, but never one that stood still. Soon, however, China is to have an army of 1,000,000 men, drilled and armed by western methods.

Fifteen Million More for "Current Expenses"

Concluded from page 8

due to lower returns on intangible property caused by higher tax rates.

This reduction represents a decrease in taxes collectible of nearly $10,000,000.

In the twelve-year period starting with 1911, the population of Ohio increased twenty per cent from 5,000,000 to 6,000,000. The increase in the tax duplicate was seventy per cent; the increase in direct taxes 210 per cent; and the increase in debt 261 per cent. If the same ratio continues for the next decade, Ohio, with a population of 7,000,000 will have a debt of more than $1,300,000,000 and each man, woman and baby will be paying a tax, a direct tax, of nearly $100 a year.

The requirements now for interest and sinking fund are so tremendous that they are attracting the attention of every organization, public and private, in the state. They require such a high percentage of the amount raised for taxation, that comparatively little is left for current expenses. In the twenty-two-year period beginning with 1900, the debt increased from $96,193,885 to $679,087,137; the first ten-year increase only totaling about $92,000,000. The colossal increases have come within the last five years. The total tax collection in the same twenty-two-year period jumped from $43,797,000 to $224,130,000, or 411 per cent. And the people in 1900 and 1910 thought they were pretty well governed at that, and were paying a fancy price for it, too.

There may not be any romance in figures, but there certainly is an awful kick in them when the taxpayer realizes that for every dollar he pays into the treasury fifty cents goes to swell the income of a bondholder on which he pays no tax—the case in some cities.

If politicians were as shrewd as they would have the public believe, they would practice economy, instead of preaching it; let their works and not their words speak for them.

Ohio is in revolt against increased taxes, and if the revolt is a success, it may result in forcing a settlement of the tax problem by compelling economies in government and a cessation of paternalistic activities and extravagant expenditures to build up political machines.

The Taft Bill has some friends in Ohio. They may be classed as contractors who feed at the public trough, road builders (sometimes termed highwaymen), material men—and political bosses.

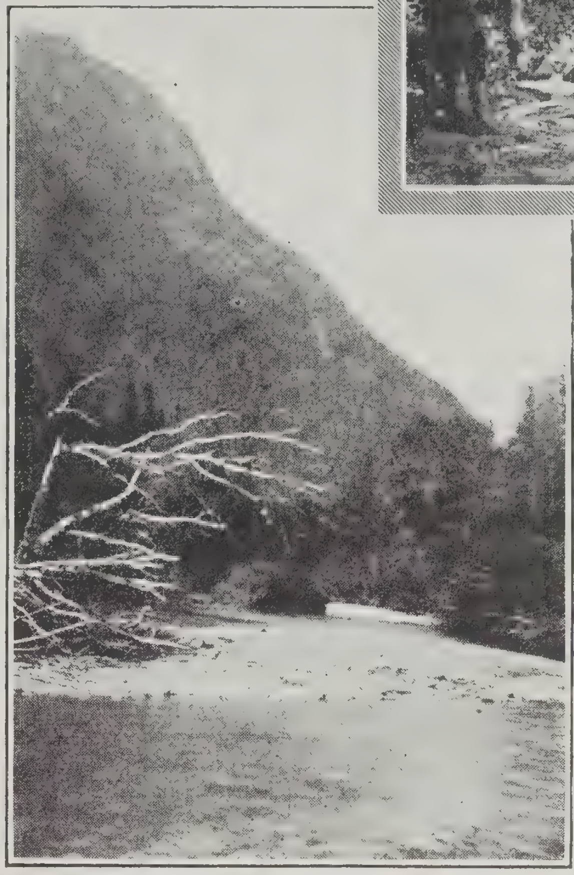
Then, too, Ohioans are going to get an opportunity to vote on the Albaugh bill, a measure of the bosses. The Albaugh Bill makes the auditor, prosecutor and president of the board of county commissioners a taxing board. The bill creates more jobs—but, perhaps that was the purpose.

Down the Curious Gaspe Peninsula

By JOHN T. FARIS, D. D.

This is the third of four articles by Dr. Faris. The fourth will appear in an early issue.

Ste. Anne River.



Mont Nicolabert, from forks of CapChat River.

PRIDE in the spacious country so wondrously spread out before him was so evident in every word and gesture of the soldier-guide to the citadel of Quebec that a visitor asked him if he was a native of the city.

But he pointed to the heights of Levis. "I was born over there," he said, with a longing look to the south bank of the river. "You haven't been there? Do go!" he pleaded. "There are heights and fortifications that have been noted since the days of the early French explorers. They have played their part in sieges of the more famous Quebec, and the building of modern fortifications over them is an indication that the government thinks they may be useful in the future. Yes, I was born in Levis!" he concluded, with the pride of the typical habitant in the country which has been his home.

The resident of Levis may well be gratified as he thinks that the hills have looked down on the glorious pageants of three hundred years, as he feasts his eyes on the vision of splendor and beauty that greets him—Gibraltar-like Quebec in the foreground, while to the right the mighty flood sweeps down toward the rising sun, between rich lands that reach northward toward the rounded Laurentides and fertile slopes that tell of intimacy with the green heights of the Alleghenies.

As Levis is left behind, it is difficult to take the eye even for a moment from the rapidly moving panorama in which the Falls of Montmorency, miles away across the river, have chief place until this is usurped by the beautiful twenty-mile-long Isle of Orleans whose fields, rising steeply from both shores toward the center, boast of kinship with the Fields of Abraham, back in the ages before the interfering river made breaks in their continuity.

A close survey first of the island, then of the fields that stretch back from the south shore of the river, will reveal similarity there also, if only in the admirable but peculiar arrangement of the holdings of the farmers. From the railway, the highway, or the river, the fields reach away in narrow parallelograms. From the railroad on the south shore the parallelograms seem to go clear to the horizon, and the dip of the land soon becomes so great that the river, five or six miles distant, is out of sight, and the land seems to join that on the north shore.

These narrow rectangular fields and farms date from the time when the original grants were made. Every landholder wanted a frontage on the river, long the sole means of transportation and the provider of fish, which formed an important part of the diet of the pioneer. Then along the river were the marshlands, where hay grew to best advantage. As the land descended from father to son, it was divided and subdivided in such a way as to give to each new holder a part of all the privileges enjoyed by the original owner.

This fact explains why the houses of the farmers look like a straggling village many miles in extent; each farmer lives at the highway end of his productive fields, and the nearness of his neighbors is in proportion to the breadth of the holding of each. At the beginning the traveler thinks he is ever about to enter a village, but soon he learns to look for the characteristic church, always stately, usually of the most solid construction, as the sign of the community center, and as the only approach to a community offered by a country where a French resident boasted of his possession of a farm two miles long. Inquiry revealed that he had fifty-six acres!

Think of the labor of the gatherers of stones—on the south shore there are many miles of stony farms—or of those who fork the plentiful hay into the picturesque carts that make royal progress down the narrow fields.

But how the tillers of these narrow acres love their holdings! and how tenaciously they retain them! In the records of Quebec are many like the following:

"Robert Caron married at Quebec, October 25, 1637, to Marede Grevit, born in Normandy. He was one of the first habitants of Ste. Anne and St. Joachim. His descendants still occupy the land which was ceded to him."

Picture the many subdivisions of the Caron grant in three hundred years! Is it any wonder each descendant has a farm that looks like a fenced-in lane? Down at the end of the lane is the little white house, usually shingled all over, for coolness in summer and warmth in winter, and a barn, with one or even two inclined approaches so that the hay wagons can drive into them on a level with the mow.

Then the traveler passes through what might well be a section of Brittany, with its well-kept fields and its cozy homes. The impression is deepened by the soft sound of the French language and the presence everywhere of black-robed priests and the nuns in their gray, white or black.

Even when the rolling slopes are succeeded by rocks and hills, the farms persist. Something of the character of the tillers is revealed by the manner of caring for the impeding rocks; some let them lie helter-skelter, others gather them in heaps, scattered here and there, while in many instances they are formed into narrow fences that guard the fields. Sometimes the farmer who dodges the stone piles approaches a picturesque stream where the water descends in rapids or in a fall, on the way to the hungry St. Lawrence; sometimes an eminence provides a satisfying glimpse of the majestic water, now widening out until it seems like a lake. And always the people show content with their surroundings; evidently dreams of the outside world and its activities do not disturb them.

Many fortunate visitors come to this land of contentment, seeking the game that roams in the woods, the fish that leap in the stream, or the shore that satisfies thousands of vacation seekers who are lured by the wonderful beaches, the salt breezes, and the lordly prospect across to the north shore, perhaps in the vicinity of Rivière du Loup, where a steamer undertakes the voyage of several hours' duration over to Tadousac and the mouth of the Saguenay.

Artists take delight in the south shore. One of their favorite abiding places is Bic, where they find picturesque nooks on the shore of the twenty-five-mile-wide river, and are not far from glades and chasms amid the mountains where the railway engineers have triumphed over difficulties by miles of ingenious construction.

Now come glimpses of lumbering activities. Mills greedily devour the logs that are brought to them down the rushing streams or on the surface of beautiful Lake Metapedia, an exquisite bowl of blue, bordered by heavily wooded hills, sprinkled at the east end with tree-covered islands. A common sight among the islands is a tiny tug hauling a monster raft of logs. But most people will find greater pleasure in watching the setting sun glorifying the waters into which it seems to drop like a plummet.

From the lake flows the Metapedia River, that famous salmon stream which for many miles winds and twists amid the hills, where the railway and the highway search for a foothold, frequently gaining it far above the rushing waters, though an anxious glance ahead reveals nothing but towering hills and seemingly impossible barriers. Straight across the peninsula it finds its way to the modest beginning of Chaleurs Bay, the arm of the sea whose name tells of the heat Jacques Cartier found there in 1535.

To the south of the bay lies New Brunswick, but to the north lies the curious Gaspé Peninsula, that reaches out more than one hundred miles like a huge lobster claw to Land's End, facing Anticosti Island in the Gulf of St. Lawrence.

The entire progress from Metapedia to Gaspé is so full of absorbing interest that slow trains and bits of poor road are lost sight of. The study of peculiar geological formations, rivers that course down rapidly to the bay, the homes and haunts of French farmers and fishermen, the boats that put bravely off to the daily quest of the denizens of the deep, the regions across the bay that may be seen until their width becomes too great for vision, give pleasing occupation for every moment. Even the traveler who usually wishes to rush to his journey's end rejoices that the road winds in and out so that the distance covered is twice the length of the peninsula. Now the way leads across a bit of land thrust out into the water; again it is in the shadow of green hills or for miles directly on the sandy beach where, at high tide, waves break within a few rods of

A Bolshevist Victim Sails to a Quieter Home

The Last Miles of a Journey to America

By MARGITA DE REGECZY

The writer of these articles on Bolshevism is a Hungarian noblewoman. This is the third and last article.

WITH the formalities over at last I could walk free into a free country, where order reigned. I had the feeling of waking up suddenly. I looked around and felt as if a mill stone had fallen from my heart. The very air seemed different to me, now that I was no more in the power of the Bolsheviki. No, not for anything would I have gone back. Other girls also have made their way without money, I thought. I was not used to working, but I certainly was as strong and as capable as any of them. This was a real romance to live through and I felt myself full of energy and hope again.

We went to a restaurant first for it had got quite late and I had not taken a meal for nearly 24 hours. It was almost seven o'clock in the evening by this time.

"I am afraid you will have to put up with a great inconvenience," Ivan (the writer's cousin) told me at table. "The two hotels of this small place are entirely filled. Passengers never used to spend the night here in ordinary times. You will not be able to find a room for the night."

We started out and tried both hotels as Ivan had done before, but in vain. Dozens of passengers who had no room crowded in the smoking room and in the hall of the small, ugly village hotels, where they expected to spend the night and wait for the Vienna train, which would start next morning.

"I will do what the other women do," I sighed. "You will smoke with the men and I will spend the night where the other ladies are."

Ivan was disconsolate.

"What would your mother say if she knew that I could not even get a room for her dear child, yet I tried to bribe both hotel keepers but it was of no use. There are several persons in every room."

Refuses Noble's Hand

I BEGAN to feel faint with the odor of smoke and the bad air of the place. We walked out in the hall and entered a small breakfast room where there was nobody. An upright piano stood there and I sat down and tried the yellow keys.

"Play me something," Ivan pleaded.

I began to play a composition of Chopin. The instrument was bad, but I had soon a few listeners. A stout woman pulled Ivan aside and said something into his ears. She was the wife of the owner of the hotel.

"Go with this lady, she will give you a room," Ivan whispered when I had finished and the fat lady pulled me along so fast that I had not even time to say "good night" to my chevalier.

"I will give you my own children's room for the night," the woman explained. "I am very fond of good music and I will not let a young lady who plays so well spend the night in the public room with all the others."

We walked up the stairs and entered a small chamber where an iron bed stood in the middle. The woman lifted her two sleeping children one after the other and took them over to the adjoining room which was her own.

"Go to sleep, young lady, you must be very tired," she said without further ceremony. "I will wake you up in time for the train."

I was left alone in the children's room very much astonished. Under other conditions the humor of the situation would have appealed to me, but I was dead tired. I dropped on the bed which had a peculiar odor, the woman not having taken the trouble to change the bed sheet of her beloved babies. I pulled my shoes off and my hair pins out of my hair. I was half asleep, but I got up once more, took my fur neckpiece and opened the lining under the fox's head. And by the light of the dim gas lamp I found the 200 Dutch florins, the sparkling diamond ring and the emerald cross.

The following day we lunched at one of the best hotels of Vienna, in the company of two other refugees, Countess C. and Count F., who had escaped from Vienna at the outbreak of the Bolshevistic revolution. Countess C. occupied the position of typist; Count F. and Ivan were transacting deals for large Austrian and Italian firms. Ivan informed me proudly that they had made about 60,000 lira profit since the time they had left Hungary.

"If you are willing to marry me in a year, you can have your own car again," he told me later when all four of us sat in the hall of the hotel. "The Bolsheviki can keep my inherited fortune if they wish, I can make another fortune."

I was not in love with him, but at this moment I was proud of him.

"At least the Bolsheviki cannot say that we Hungarian nobles are weak and deteriorated in spite of our long line of ancestors," I said, remembering how much I had gone through in the last times. "Never in my life have I felt more courageous and energetic."

Ivan bent over my shoulder and whispered:

"Promise that you will marry me in a year. I know that you think of going to America—forget about it—do not go so far away. Stay here or go to Holland and come back when you feel inclined to become my wife."

"I do not think I will ever marry a nobleman," I replied seriously. "For too long a time the same kind of people have married in my family. There must be one at last who is different from the others. The war and Bolshevism have changed our country so much that the old times will never come again, and we have to make the best of it. I long to work and to be independent. When I think of that splendid free country across the ocean, of my unknown future friends whom I will meet and of the life in the New World, I am thrilled all over with joy."

Ivan did not know how determined I was. "I trust that you will soon be tired of the struggle," he said gently and did not speak any more of his own plans.

I intended to take the evening train to Berlin and go straight to Holland. The 300 crowns accorded by the Bolsheviki would buy my ticket to Berlin and there I would have to change my Dutch money which had been saved.

"What have all these Hollanders to smile about?" I wondered, for I had not seen people smile on the street for many months at home.

A beautiful time followed after this. My 80-year-old noble godfather invited me to stay at his house in the most pressing terms. The famous statesman—the greatest man of Holland for many years—lived alone with his granddaughter, who was keeping house for him. I appeared at concerts in The Hague and in other cities and made quite a bit of money. I intended to ask a passport to America as soon as the peace with Hungary would be signed.

One day an old friend called on the family, the Dutch ambassador to England, who had been ambassador to America previously.

"Why do you not go to the United States?" he asked me, hearing my story. "The conditions in your country will not be normal for a long time and if you like to be independent and to work, the best country for you is America."

"I want to go, indeed," I replied, "but the peace is not signed yet and it is difficult to get a passport."

"Never worry about that. I am going to Washington in three weeks and I will get you the permit myself at the state department."

On Her Way to America

SIX weeks later I had an American visa on my passport and nothing stood in my way to realize my wish. The only person whom I knew in this country was a friend living in California. I did not know a single soul in New York, but I had quite a few letters of introduction and did not worry in the least.

I was so much filled with joy and expectation that I pretty nearly forgot to think about the financial part of the trip. With the proceeds of my concerts I bought a first-class passage and all the clothing I needed. When I changed my remaining funds into American currency I realized that I had $150 left to start with in New York. European money, even the Dutch, melts into a very small sum, if you change it into American money.

I knew well that my godfather would give me any amount of money I needed, but I did not like to ask him. "Never mind, this will be another interesting experience," I thought. "If I could come to Holland with 200 florins I can try America with $150."

Among other introductions I had received one to the Rev. Dr. P., minister of the Presbyterian church. After a week's stay at the hotel I called on him.

"I will take you to my wife," the gentleman said after having read the letter, "and I am sure that she will do what she can to make you feel at home in New York."

When Mrs. P. read my different letters of introduction and learned that I was staying alone at a hotel, she took me to her unoccupied guest room.

"I do not like you to live alone at a strange hotel, without having anybody to look out for you," she said with a kind smile.

A month after I thought it time to get more settled and left the minister's home.

This is the story of my coming to the United States.

Down the Curious Gaspe Peninsula

Concluded from page 13

the car window. One section of the road is for some fifty miles within sight of the water.

Villages are close together along the coast. In each one the church is the dominant feature, though sometimes the local branch of a great fisherman's supply company—which was founded in 1766—is almost as prominent. This company is to the fishermen, in a small way, what the Hudson Bay Company has been to the trapper. The establishment of the manager, where the clerk's lodge, as in more primitive days, is a social center, the great house of the village. Discipline is almost military in its severity; the clerks know that they are subject to the command of their superior, and even to transfer to another branch at the will of that superior. But the rule of the company along the fishing coasts of Canada is helpful and, usually, welcome.

Here and there on the coast great black crosses mark the site of some disaster that has overtaken the fishermen. Frequently a position by the side of the cross gives an opportunity to study the sturdy men and the boats on which they brave the waves, the drying of the fish they have brought to land, the nets hung to dry on a fence or in process of repairs after damage done by storm or a heavy haul. And here and there are the curious lobster pots, each supplied with an anchor stone, which is securely fastened to the pot by means of a yoke of wood fitted into a shallow groove chipped in the stone and secured in place by lashings of coarse twine.

Among the most picturesque of the fishing villages is Percé, where the mountains come down to the sea and the houses are scattered promiscuously along the beach. Visitors seek the village not only because of the charm of the immediate surroundings, but because of the extensions of the rocky promontory that come down to the beach, the famous Percé Rock, and Bonaventure Island. On rock and island are the bird reservations where gannets, herring gulls, cormorants, auks, puffin and guillemots gather for the rearing of their young.

Precipitous Percé Rock, nearly three hundred feet to the top and fifteen hundred feet long, defies the climber; the screeching, opposing birds combine with the difficult cliffs to drive back those venturesome enough to think of going aloft. At Bonaventure, three miles distant, the seaward face is also difficult of access, because of the red sandstone cliffs whose coloring, contrasted with the black and brown and white of the teeming bird population, is the delight of the visitors.

The Gannets of Gaspe

THE chief bird officer of Ontario and Quebec was told by one of these boatmen that he thought persons visiting the gannet cliffs on Bonaventure for the first time should be tied to the thwarts on which they sit, for they are apt to become so excited when they behold the throngs of birds at close range that they are in danger of leaping overboard. Accustomed as he himself was to the sight, he declared he could not see without emotion the gannets in their nests, as he visited this outpost of Gaspé—one of the two places in North America where these birds nest. The other, and smaller, of these colonies, is on the Bird Rocks, in the Magdalen Islands, which are not nearly so accessible.

Reluctantly the back is turned on Percé. The road leaves the sea for a dash through the forest-covered Percé Mountains. Suddenly the sea appears once more at Corner of the Beach. Then along the beach to Barachois, and a look backward that takes the breath away—green heights ashore, a gleaming beach near at hand, blue waters sweeping in from the gulf, and out to sea a study of Percé Rock that makes the gazer gasp or perhaps brings the tears. On a clear day the rock shows in all its majestic proportions, including the forty-foot high archway cut by the waves, from which it takes its name. Once there was another and much larger arch, but in 1846 this fell with a crash. The wreckage strewn about the end of the rock shows how great must have been the fall.

But the supreme experience of the comparatively few visitors who have learned to seek the peninsula is reserved for those who go on to Gaspé Basin, sheltered by the great promontory that bends out into the Atlantic. There, it is supposed by some, the Vikings had a fishing station a thousand years ago; there Jacques Cartier landed in 1534; there expeditions against Quebec paused for breath; there, at the beginning of the Great War, the first Canadian expedition assembled before beginning its stealthy dash across the Atlantic, in response to the summons of the motherland.

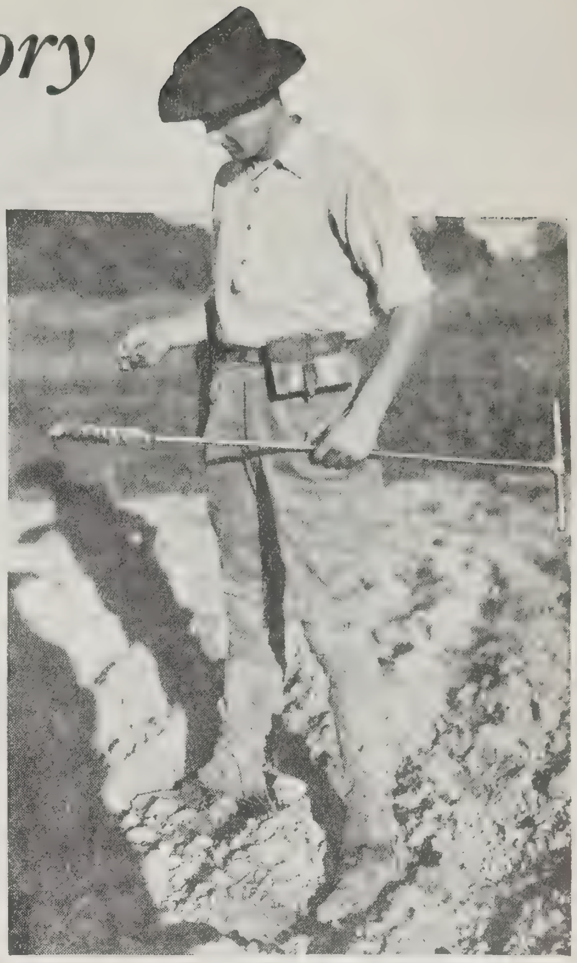
A visit to Gaspé is an event of a lifetime. To study the reflection of the sun as it drops into the depths; to note the twinkling of the harbor lights, as one by one they begin to glow; to see a tramp steamer enter the basin from the Atlantic—perhaps a salt ship from Cadiz, whose burden is awaited by the fishermen; to climb the steep streets or wander above the water; to enter the houses and churches, which have numerous reminders of the days of the sturdy Jerseymen who settled the coast, including the immense table stone in the Anglican Church, brought from Jersey, on which are carved the Ten Commandments; to examine the mahogany wainscoting in One Ash House, fashioned lovingly by a skilled worker from the spare of a schooner wrecked in the basin; to climb the terraces of the hotel, the historic resort of fishermen and hunters for a generation; to talk to the old harbor master, whose father had the position before him, of adventures in quest of old mahogany, of the days before the coming of the railroad—only fifteen years or so ago—when, during the long winters there was no communication with the outside world sometimes for weeks together; to go back up York River after moose, caribou, and deer—this is the beginning of tasting the joys of Gaspé.

And the end? There is no end!

Uncle Sam Takes Soil Inventory

Checking Up the "Contents" of Great Value

By HAZEL HANKINSON



Survey men carefully examine the soil so that they may give each type its correct name on the map.

"WHAT in the world are those fellows doing over there in my field?"

A farmer, clad in overalls, ready for work, hurls the question at his horses' heads as he drives them out of the barnyard and down the lane toward the gate of the lower forty.

Out in the middle of the field is a man in khaki trousers and high-topped boots, and over by the pasture fence is another. With augers they industriously bore into the ground to the depth of three, or maybe six feet. Their fingers become grimy as they examine the earth which clings to these augers. On a card they make little drawings and jot down a few notes.

"What you doing?" asks the overall man as he and his team come closer to the scene of action.

"Taking inventory," answers one of the khaki men smiling.

"Inventory!"

"Yes, your farm is just another part of old Mother Earth's storehouse, you know. Got to check up the contents and find out what we've got here on this old planet." The khaki man starts boring again in another place and goes on talking.

"We are trying to find out all we can about the soil of this farm of yours just now, and eventually about the soil of the whole country. When we get through we expect to know all the different kinds of soil, what crops are especially suited to each, how much can be produced on them, and what fertilizers are needed."

"That's interesting," remarked the farmer. "Why the little 'gunny' sacks?" pointing to two or three small cloth bags lying on the ground near by.

"Oh, we're taking samples of some of your soil," replied the other. "Analyses are to be made in the laboratory at the Agricultural College, so that it will be known exactly what the texture of the soil is, and how much plant food the various crops require on ground of this type. Some day you can find out all about this from a map and a report which the college will have prepared. Like to talk longer with you, but we're about to start work on another forty over west of here now, since we've finished this one.

"S'long. Glad to have met you." And the two men with their augers and sacks sputter off down the road in a car marked "State Property."

Almost any day between the months of May and November in the North, and later in the South, some farmer in any one of twenty-six different states vocally or mentally makes this same inquiry about America's soil survey workers.

One of these men in khaki represents the United States Bureau of Soils. The other is a soil survey man from the state experiment station. These experts work together making maps to show where different soils are located and just how far each sandy or loamy, clay or marshy piece extends. Every section of each county is examined at distances of about a quarter of a mile, and after a county is finished, farmers may see their fields mapped out in colors like a wonderful Joseph's coat.

Differences as small as from five to ten acres are shown. Roads, railroads, and streams are there, too, and towns, schools, churches, and farmhouses appear on this vari-colored map of Mother Earth.

Just as animals and plants are classified and named so that no matter where we find them we feel acquainted with them, so it is with soils. Each different type is given a name when first mapped, and this name remains the same whether the soil is found in New York or Wisconsin, California or Texas.

It is because the same soils appear in many states that Uncle Sam's men from Washington are sent to work with the men in the various states engaged in the survey. They help to keep the mapping uniform throughout the country.

The state men, however, make a more careful study of the needs and uses of the soils within their own borders. They find out not only all they can about the earth to the depth of six feet, but they look to the water supply and the drainage conditions as well. They learn what crops are best suited to particular localities and to each soil. They find out what systems the farmers use to best advantage, and how the fields are best managed to keep them fertile.

When the survey of a county is finished, the map and the information which the men have gathered are published together by the college of agriculture of that state.

Farming and non-farming lands are indicated, and those best adapted for the growing of trees, or for grazing. The reports show also just how rich the soils are naturally, and what the different types need to improve them. They aid in finding the soils best suited to any kind of crop.

Thus the horticulturist as well as the general farmer is helped in finding the best location for his orchards. The truck farmer is aided in looking for a small fruit and vegetable farm.

Suppose either city or country folk are interested in taking up new homes in some unimproved section. The soil map gives them accurate information and helps them to choose the best place to buy or rent.

Real estate dealers and colonization companies use the maps, too, in getting settlers located. Bankers and land appraisers find them valuable in deciding on land values and how much money can be loaned on any particular site.

To Discuss Wisconsin Is to Discuss "Bob"

Concluded from page 7

this "be equitably accomplished through several different gradations of taxation."

These are but straws that indicate what the people of Wisconsin are thinking. National leaders who champion these ideas will gain strength in the state.

But so far as sentiment developing for national candidates there has not been a stirring. The Democratic party has been so completely assimilated that it will take some coaxing to bring about much enthusiasm. The Democratic leaders who are still in the fight are much of the La Follette type—Progressive—but still Democrats.

President Harding did not get a delegation from Wisconsin two years ago, and unless conditions change, he will not get a delegation next year. Careful judgment would indicate that Senator La Follette will not worry much about who will carry Wisconsin—he expects to have this honor conferred upon him.

"Under the Harding Administration the System has openly taken charge of the government at Washington," Senator La Follette charges. "It is no longer an 'Invisible Government.' It swaggers in the White House, struts through the departments, and cracks its whip in the halls of Congress.

"The System is a hard, cruel, ruthless master. It recognizes no restraining law, either statutory or moral. It exacts all it can squeeze out of the millions on millions of daily sales. It takes profits up to the last limit of the purchasing power of people, who must buy coal, clothing, food and shelter or starve and freeze.

"Under the Constitution, the American citizen had the right to believe that this was his government, and that it would establish and maintain justice and promote the general welfare.

"What mockery!

"Government by the System is industrial and economic slavery.

"System government is a constant menace to peace. As long as it controls it will maintain a large army, a huge navy ready for aggressive warfare in any part of the world. War waits on the threshold of our foreign affairs.

"Whenever the financial interests of the System will be served best by foreign war, it is ready and—it declares war.

"What folly to talk of controlling the size of the army and navy; the making of treaties to preserve peace and good will among nations; or the creation of leagues and tribunals to end war, under a President or a Congress elected and controlled by the organized monopoly power which knows no law but might, and is the only element in our country the profits of which are greater in war than peace!

"And this brings me to say that the first battle to be won by the men and women of these United States is to drive the public officials who serve the System out of public life, regardless of the political party to which they belong."

The soil of Wisconsin is potential with reform. In territorial days it had a communistic experiment that rivaled the Brook Farm. The forty-eighters of Germany came bringing with them their ideas of religion and political liberty, and the Scandinavian and other peoples striving for a foothold brought doctrines of economic freedom. The state went in for victory with the Granger movement of the early seventies when farmers demanded reforms, and then settled back to become a Conservative Republican state until a Democrat slipped into power in the early nineties on an educational issue.

Then came La Follette stirring the people to action. Since his election as governor in 1900 not a single battle that he has personally waged has he lost. Three times elected governor; he has served as United States Senator from the state since 1906, having been re-elected three times. La Follette always conducts his battles within the Republican party.

Four times he has been a presidential candidate on the Republican ticket, having a large majority of the delegation from Wisconsin each time. North Dakota has generally voted for La Follette. And Wisconsin will send another majority delegation to the Republican convention next year for Senator La Follette.

This is the second article of a series to appear during the coming months. The first had to do with politics in Kansas.

Richest Town Strives for Ideal Community

Concluded from page 9

as ordinarily all cut stone comes to a building ready to set. In this case the architects wished to avoid the harsh contrasts and sharp lines of cut stone, which is usually limestone, and, instead, are having the stone for mullions, jambs and other molded portions cut by hand from the same stone as is used in the walls. As a result, all the stone for these parts comes from the quarry in huge boulders and is dressed on the spot. This method has not been used to this extent for probably 400 years, and gives a degree of craftsmanship that is striking and one which is almost never seen in this country.

"In every part of the building only the most solid and permanent construction will be used, with special attention given to keeping the maintenance cost at the extreme minimum. For example, there will be no wood on the exterior except the doors and their frames; the windows are all metal and have metal frames, and even the wood usually found around the eaves and gables has been entirely eliminated, so that there will be no depreciation. The rafters will be steel in all cases except where the open roof construction occurs over the Legion room.

"There will be two main entrances to the building, one under a porte cochere and the other from a broad terrace across the southern front. Entering by the porte cochere one is led by a half flight of stone steps to the main floor. Entering by the terrace entrance one is brought directly into the memorial hall, occupying all the interior of the tower. Thus the two entrances converge to this memorial hall, which forms the pivot of the whole building. This hall will have stone floors and walls, and stone groining and ceiling, and will be lighted from the large leaded windows seen on the outside of the tower. Here will be placed the monumental setting in stone for the bronze tablet, and the effect will be inspiring."

An outside dancing floor will be a feature of the building. Just north of the tribute hall is a cherry tree, said to be one of the largest in the United States. Its trunk is forty-eight inches in diameter, and its branches spread in all directions. Beneath and around this is to be laid a green tile floor, resembling grass at a distance and suitable for dancing purposes. A box for musicians and stone benches for resting will flank the place. The architecture of the building is a transitional Tudor and Renaissance development, designed for the double purpose of meeting the classic exterior features of a memorial without shutting off the light that will make the interior useful and comfortable.

Merion's comparative freedom from burglars is due partly to the fact that her policemen are known all over the country as dead shots. A privately owned underground rifle range is used regularly by the men. The association employs two private policemen in addition to the regular township force. It is not only against criminals that the association has shown the power of public opinion, however. Early in its career it locked horns with the Pennsylvania Railroad Company when citizens complained of the ancient station at Merion. It took several years, but so much clamor was raised that finally the road built a handsome new station.

The annals of the association show a list of some fifty major accomplishments. That list includes such items as those mentioned above in the outline of benefits to members, and other civic services such as the breaking of a pathway through the snow on every Merion street during winter months. It might be assumed that the expense of all this would amount to a considerable sum, but as a matter of fact the total budget of the association for the fiscal year just ended was $8,341.01, of which $2,278.10 was for salaries of special policemen and $1,749.96 for the salary of a secretary.

UNIV OF ILLINOIS
URBANA

BRIEFLY TOLD

During the recent eruption of Mount Etna, a Sicilian peasant dug a hole in the outer crust of the cooling lava until he reached the almost boiling lava below. He lowered a pan filled with water, which was thus heated to a point where it could cook food. He then proceeded to prepare a meal for himself and other refugees.

Abandoning his train full of passengers to take a peek at the Chicago-Philadelphia ball game, a motorman of an elevated train in Chicago recently held up "L" traffic on the north side for half an hour. Becoming interested in the game he forgot to return to his cab.

Labor recruiters penetrate to remote villages of Northern Argentine and with the promise of high wages induce Indians and their families to leave home. The laborers are transported on flat cars with accommodations worse than those provided for live stock. They are herded on estates under the open sky without sufficient food. They are hard workers, and their pay is practically nothing, their wages being in the form of orders, valid only at the plantation store, where they are charged exorbitant prices for the poorest quality of goods. If any balance is left at the end of the accounting, the workers are induced to spend it for liquors of which they are very fond. The national department of labor of Argentina is authority for this information.

Major Henry H. Curran has been appointed Immigration Commissioner at Ellis Island to succeed Robert E. Tod, who has resigned. Major Curran is forty-five years old and a graduate of Yale University and of the New York Law School. At one time he was a reporter on the New York *Tribune*. Major Curran was with the A. E. F. and in 1919 he was chosen by the Republicans to run for borough president of Manhattan. He was elected, the first man ever put in that office on a straight G. O. P. ticket. He is a writer and lecturer on politics.

"Candidate" is, originally, a Latin word which means "white." With the ancient Romans, at election time, those who were running for office wore a "toga candida," a white mantle, emblem of the purity of their political intentions. A herald announced to the voters gathered in the forum: "tua res agitur" (your interests are to be attended to!"); and then the tribunes took each candidate by the hand and led him around, presenting him to the crowd.

Japan has retired 850 officers, including seven generals, since August, 1922. The Japanese Government has announced that it will shortly discharge from the service 1,371 additional officers, including four generals, seventeen lieutenant-generals, and thirty-three major-generals. Many retired officers have entered the Department of Economics of the Imperial University to qualify for civilian occupations.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

In Spanish cities at eleven o'clock at night the doors of all rooming houses are closed and locked. After that hour one can get in only by calling the guard or watchman of his particular block. This is an old Spanish custom which holds over to the present day in nearly all the cities of Spain. The watchman carries a lantern and the keys of all the houses under his charge.

A state law regulating aviation in Kansas supervises aerial flight, determines qualifications of pilots, prescribes uniform traffic rules and generally guards the interests of the public. The aircraft board has authority to issue licenses for airplanes at twenty dollars and flyers at ten dollars a year. Cities are empowered to establish and maintain municipal aviation fields out of city funds.

Magnetism was known 3,000 years ago. Ancient Greeks discovered blackstones in the vicinity of Magnesian in Lydia which had the power of attracting iron and were themselves attracted to each other by an invisible force. "Magnet" derives its name from its original point of discovery —"Magnesian."

In Chicago 1,285,000 persons or 300,000 families move every year, according to figures compiled by the gas company.

The Soviet government, in an official statement, says all Jews who wish to join relatives in Amercia may do so by applying for emigration passports. Permission has been granted the all-Russian Jewish Relief Committee to establish branches throughout Russia to facilitate emigration.

Alvin M. Owsley, national commander of the American Legion, says, "It will take five years to write a sensible law to govern immigration and until that time the United States should bar those who are coming here seeking to avoid the consequences of a war which they brought upon themselves."

Although Montenegro contains rich and fertile fields in parts of the country, taken as a whole it is one of the poorest countries in Europe. Before the European War Russia built roads, bridges, churches and schools there. The natives are brave and fearless and have beaten back the Turkish swarms for 500 years. Of all the Balkan peoples, they alone have never bowed to the Turk.

One of the world's greatest iron ore regions is located in the interior of Brazil. The ore-beds are pure and abundant and the only drawback to development lies in the lack of transportation. The natives smelt the ore and fashion it into utensils and farming implements by the crudest process known to modern man. With the abundant waterpower to develop current for electric furnaces, the economic development of this area will soon be solved. Brazil now imports large quantities of iron and sheet from other countries.

Of the 2,000 actors engaged in the various legitimate productions in the New York theater, during the season now drawing to a close, about ten per cent are Jews. Forty per cent of the sixty-odd so-called American plays produced were written by Jews. The plays eventually produced were brought on to the stages of theaters of which more than half are either owned or controlled by Jews. And after a New York run these plays are booked on the road by organizations which are practically one hundred per cent Jewish.

Rudyard Kipling is a first cousin to Stanley Baldwin, the British Prime Minister.

The principal crop of Yucatan is the henequen (sisal). The fields are cleared with axes and machetes. No plowing or harrowing is done in the preparation of the henequen ground. The suckers of the plant are merely placed in holes in the sparse soil among the rocks.

In honor of his dog just dead and buried, the governor of Maine ordered the American flag displayed at half-staff over the state house at Bangor.

Third Party Held Not to Be the Way Out

Uncle Sam's "Ugly Duckling"—Alaska

CHRONICLER OF THE NEGLECTED TRUTH

Take Over Party Machinery, Advise Wise Ones

Don't Try to Form a Third Group, Use the Old Organizations

By AARON HARDY ULM

"THE Blank party," says a high official in one of the old political party organizations, "is no pink tea affair. No one need await an invitation to step in and, if they can, run it."

No organization in this country is less exclusive than the old political parties. Virtually no credentials are required for entering either. And there is no arbitrary barrier against anyone taking directing part in the management of either party.

In many states, it is true, the laws require you to enroll as a party adherent before you may take part in choosing party candidates or party officials. In others, the parties themselves lay down rules governing participation in strictly party affairs.

But none requires the voter to subscribe even to party tenets. For example, to qualify as an active member of the Republican party does not mean that you have to hold belief in the theory of protection; nor, to become an active Democrat, with all the rights of every other active Democrat, do you have to take the contrary view.

By neither statutory nor party law are you even required to vote the ticket of the party to which you "belong."

Hence our political party structures are the most open of open-houses—houses which, at least theoretically, may be taken over at any time by new occupants and managers.

This is now so well recognized that, in despite of the unusual clamor against the old parties as conducted, there probably is less demand at the present time than ever before for the development of a third party.

"Why bother to organize a new party," say wise advocates of political revolt, "when, if we have the strength to form a new party that will win, it is much easier to take over the machinery of one of the old parties."

Done in Some Cases

IN NUMEROUS state and local cases that has been done in recent years.

Democrats have been elected to important offices as Republican candidates. There are Republican and Democratic "organizations" today which bear little resemblance to the general and traditional complexions of those parties.

Taken as a whole both Republican and Democratic national "organizations," in a physical sense, are, in ninety per cent extent, scarcely more than houses of cards. A serious whiff from the voters at any time would bring them down on the heads of the politicians.

On paper these "organizations" are stronger than they ever were before; actually they are much weaker. Millions have been spent during the last dozen years in endeavoring to build up the organizations of both old parties.

On each has been spent more during "off" years than formerly was spent during Presidential election years. The $50,000 which the Republican National Committee expended in promoting the first election of Abraham Lincoln would not now maintain its permanent national headquarters during much more than a month of an "off" year. If the sum would do more for the permanent headquarters of the Democratic committee it would be because, since that party has been a national "out," those who run that establishment have found it difficult to raise large funds.

Permanent national headquarters have become fixtures if not necessities of the old parties. In fact, permanent headquarters are maintained for many states and cities, where the idea originated.

The Use of Propaganda

THE duties of these party establishments, conducted largely by salaried experts, is to look regularly after the details of organization and propaganda.

This is made necessary not solely by the complexities of the times. It is the result essentially of insidiously growing weakness within the parties. This weakness is in the vitals of the parties, vitals made up in the main of things that you can't catalog; that is, tradition, sentiment, principle, loyalty on the part of adherents, enthusiasm.

There was a time when seventy-five per cent or more voters of this country divided themselves fixedly between the two major parties, and followed them faithfully whether right or wrong. It is doubtful if as many as twenty-five per cent of the voters "belong" to the parties in that way today. Indeed, in recent years both parties together have been able to get the votes ordinarily of not more than fifty per cent of all the persons who might vote. They used to command the ballots of from seventy to ninety per cent of all possible voters.

When the parties possessed real vitality, perfunctory organization could be and was to a great extent ignored. It was developed highly in a few localities, as by Tammany Hall in New York City, where peculiar conditions prevailed. Even within the last thirty years the national headquarters of the parties during Presidential campaigns often found a half-dozen office rooms and twenty-five to fifty workers sufficient. The Republicans, under Mark Hanna's direction in 1896, first responded to changed conditions. Now it takes several hundred office rooms to house the thousand or more persons needed for carrying on the work of national headquarters during a Presidential campaign.

As party spirit among the rank and file of the voters has changed and fallen, the paper organization of the parties has expanded. For the enthusiasm of yore there has been introduced—the card index.

The card index, now so relied upon by party managers, looks terribly formidable. But, speaking as one who had something to do with building up and employing some of them, the writer can vouch for the fact that they are very flimsy indeed.

It may be doubted if a letter directed from the national headquarters of either party to each of the "organized" adherents listed in its files would bring replies from as many as ten per cent of those addressed. This would be the case even though the letter asked for nothing but a reply. If it asked, say, for subscriptions to party funds it wouldn't be responded to ordinarily by fewer than one per cent.

And scarcely more than five per cent of all the voters are recorded as dependable Democrats or Republicans in the vast files maintained by the national committees.

The Party Manager of Today

THE party manager who used to give orders to his organization like a general commanding an army now has to beg, beseech and implore.

In fact, on a show-down, the average party manager depends but little upon his perfunctory organization, the manifold committees and clubs and their members. There are exceptions as in those surviving local cases where organizations still are nourished by spoils and pelf.

But spoils and pelf, once the red corpuscles in the life blood of nearly all organized politics, now count for but little in the inspiriting of national political organization of what might be called the "regular" kind. They have a lot to do still with subterranean equations; such as those identified with much of the "big money" upon which both big-party organizations are almost absolutely dependent.

The spoils and pelf that used to inspirit the far-flung errand-running that made national party organizations vital were typified by the public job of the kind which is now of no immense political importance. There are two reasons for this. One is the taking from full political control most Federal government positions. More influential probably is the fact that the public job, as a mere position, no longer has the attraction it once possessed. There was a time when a clerkship in a Washington department was considered a glorious position. The kind of talent it once attracted now, finding so much better opportunity in business or industry, treats it with scorn.

At one time party managers didn't need much by way of campaign funds, at least not for "legitimate" use. The errand-running which now has to be paid for would be done for nothing, out of enthusiasm or prospect of getting a political job.

Now, however, the parties need millions with which to inspirit the already convinced; that is, of the persons already listed as party adherents. The "red fire" of modern campaigning has two purposes, neither of which is to persuade. One is to convince the independent onlooker that the party producing the flame and the noise is going to win. The other is to motivate the "party worker." For the old party organizations have so fallen in real vitality that the average "party man," no matter how loyal, won't exert himself very much unless those displays which take money to make are in evidence. What handler of the political doughbags hasn't had to daily face this plea?—

"We don't need the money to get the folks thinking our way but if you don't let us have so many thousands the boys will lose heart and won't get out the vote."

More than three-quarters of all old-party campaigning operations now aim solely at "getting out the vote." It is such a ponderous task that it leaves little time or energy for use in the ever-growing field of persuasion.

It has come to the point whereby the party getting out the largest percentage of its own vote is the probable winner. For party managers generally count on a great proportion of the voters, once in the voting booth, to mark ballots quite automatically.

Eighty Per Cent Vote Automatically

INDEED, eighty per cent of the persons who go to the polls do vote automatically; that is, they vote as did their fathers. Political automatism has been promoted by some modern-day devices which aim ostensibly at discouraging it. Long ballots, for example, lead more busy persons to vote a party ticket straight than to exercise discrimination as to each name and proposal on the ballot. It is not unusual now in some states for the ballot to contain from 200 to 500 propositions which the voter may pass on singly, or, particularly in the case of candidacies for office, in groups. To pass intelligently on each item calls for more time than the average person will give to voting. Hence thousands merely make a single mark indicating that they vote for all Republicans or all Democrats and let it go at that. If a simpler system were used the voters might split their ballots.

This automatism has the appearance and, usually the effect on results, of genuine party loyalty. But because it is automatism and not the sort of party fealty that used to prevail among the majority of the voters, the great apparent strength of the parties on severe test would prove to be pale and thin indeed—as already has been shown by many a local case, but not as yet nationally.

In fact, that allegiance to party traditions which still survives is more negative than positive. It partakes more of feeling against the other party than for the one espoused. The South, for example, remains staunchly Democratic chiefly because of the Negro question and the Republican party's traditional attitude thereto, rather than because of any sublime devotion to the party of Jefferson.

All of which is set down here to show how the old-party structures have become in great measure mere shells which can easily be taken over or crushed by voters determined to get results. On paper, organized politics, as typified by party organizations, seems to be invincible. In fact, these organizations are so weak that political revolts which fifty years ago would have aroused only scornful smiles on the faces of party managers, now set the politicians debating as to whether they shall run to cover or join in the assault.

Until within comparatively recent years assaults on organized politics had to be made from without. For example, the Mugwump movement in Blaine's day could get nowhere except through leading Republicans away from the fold and temporarily into the Democratic camp. The Bryan movement in the Democratic party never would have amounted to much but for its being preceded by the schism achieved via the Populist party. But the Bull Moose movement of a few years ago failed for the very reason that the Mugwumps and the Populists measurably succeeded; that is, because the main assault was made outside of instead of within the bounds of the old parties. If the Rooseveltites had continued their revolt within the Republican party the Old Guard long ago would have been historical only.

"Boring From Within" Better

ASSAULTS from without still may succeed; in some respects they have a better chance than ever before. But because of conditions having little to do with true vitality in the old-party organizations successful assaults from without are now more likely to be temporary and casual than permanent and general. One reason is the immense detail which law and custom now place upon political operations—detail that calls for organization, though it be in the main perfunctory, of a kind that cannot be brought into existence overnight.

But it is no longer necessary to develop that organization anew. It can be taken over much more easily.

Succinctly, the voters convinced of what they want and determined to get their way, can make their will prevail despite, and even through, organized politics of the most unsavory kind. They can attack party programs through the parties themselves and when desirable take over, operate and even turn the party machine against itself. This was demonstrated as long ago as 1912 by Woodrow Wilson's nomination at Baltimore. There organized politics was arrayed against the Princetonian and it had the nominal power to prevent his nomination. But it didn't have the actual power for the reason that the voters' demand for Wilson had managed to percolate the most carefully erected handmade barriers arrayed against him. This demand finally prevailed despite the unit rule governing state delegations and the two-thirds rule controlling the nomination—both of which are mighty tools for use by organized politics in putting over its will. In fact, in the highest precincts of the hand-picked occurred the final break at the Baltimore convention. The leap to Wilson by the Roger Sullivan delegates from Illinois brought on the finish.

Must Have the Voters

MANY considerations enter into the motives and desires of the professional type of party politician. But even with the most callous, the will to win rarely is secondary to other considerations.

And in the ultimate they can win only by assistance from the voters—and voters other than those who can be depended on to follow the organization blindly.

So, despite all the impedimenta which seem to hobble free action on the part of the voters, especially with reference to national affairs, it still is impossible to put over any candidate for, say, President, whom a majority of the voters don't want. And it is easier perhaps than ever before for the voters to procure for President the person they do want.

And as long as the Presidency is safe, or reasonably so, the rest doesn't matter a great deal. More and more have we made the President *the* government; in some senses even more than the national government. By common consent the highest office has been given powers that lie far outside the Constitution. Its occupant is held responsible for many things of which the Constitution takes no note—indeed, for many things which the Constitution, strictly construed, would compel others to handle. As government now is conducted it is to the President that the humble citizen may look almost alone with any degree of confidence for other than juridical, or court, justice. And the Presidency—despite attempts of the founders of our government to shield that office from the free play of opinion—is the branch of government which the voters can hold to strictest accountability.

That's one, perhaps the chief, reason we get more excited over electing a President than any other official or group of officials. This hasn't always been so; in fact, in the early days of the Republic the average voter took little interest in the Presidency, as compared with interest taken in other offices.

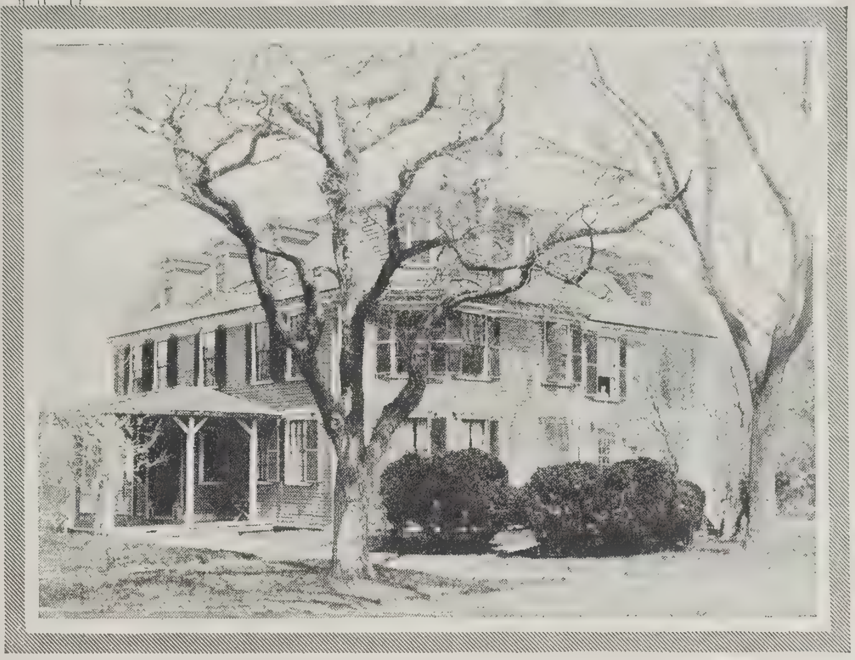
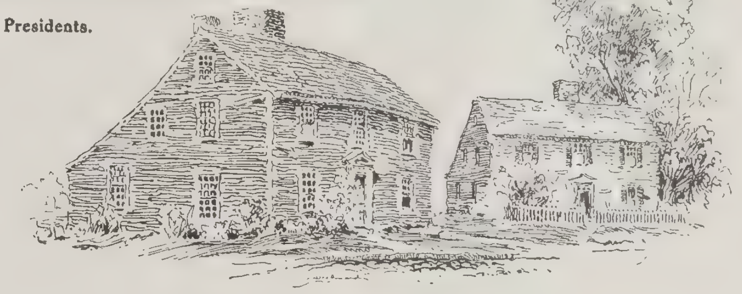
Quincy, an Historical Tapestry of Adventures Grave and Gay

It Was Here That "Calfe of Horeb" Was Set Up



Above—The Dorothy House. At right—Birthplaces of the Presidents.



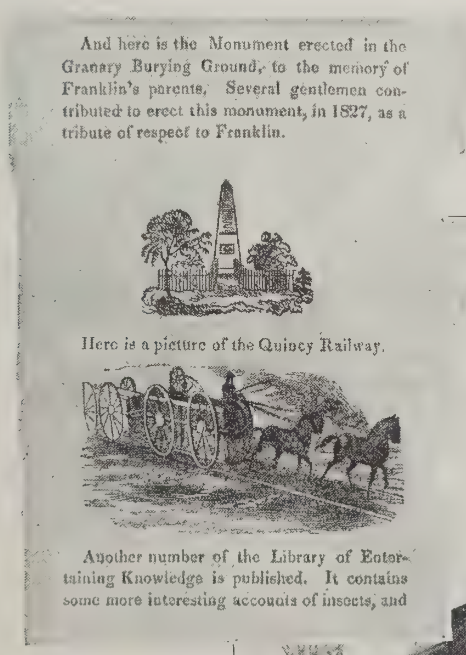
By MAY B. WHITING

THE city of Quincy, prosaic and prosperous today with its shipbuilding and its quarries, gives little hint that its youth was a tapestry of adventures grave and gay, and that, for one episode, it was the prodigal of the colonies, sowing its wild oats as no other settlement dreamed of doing. For here, on May Day almost 300 years ago, was set up that "Idoll," that "calfe of Horeb," that abomination to the virtuous folk at Plymouth, the May-pole of Merry Mount.

In 1625 Captain Wollaston, "a man of pretie parts," came, with about thirty followers, to the new plantation. But he was not pleased with the first harvest and withdrew to Virginia. Then one Morton, "a petty-fogger from Furnival's Inn," assumed authority and under him the company became a set of roisterers, spending their time feasting and drinking, and inviting the Indians to join them in their revels.

On May Day, 1627, they planned to change the name of their habitation from Mt. Wollaston to Merry Mount and, "with drummes, gunnes, pistols and other fitting instruments," they set up a May-pole, "a goodly pine of eighty foote long, with a peare of buckshornes nayled somewhat neare to the top of it." About this, writes Bradford, they revelled for many days together, "inviting the Indian women for their consorts, dancing and frisking together like so many fairies, or furies, rather." To add to the scandal, Morton nailed "poetrie" to the tree, verses of his own composing, "tending to destruction," until the outraged Puritan could stand it no longer. Endicott admonished that there must be "better walking" and, that failing, Myles Standish, with his army of eight, stormed the wildwood citadel, captured "mine host of Merry Mount," and dispersed his followers. But they could not reform this "lord of misrule." Morton was sent to England in bilbowes, but he did not there forget his grudge and did all he could to harm the colonies. Yet the lure of the New World held him. Before long he was back, seeking out "his old nest at Merry Mount," where only his age saved him from the whipping-post. "Grown old in wickedness," he still loved pleasure to the end. There were rumors of a town in Maine, Agamenticus, where the frolics of Merry England should be held in high esteem, and, half sick, he dragged himself across the wilderness, only to find a handful of fellows as luckless as himself. Their miserable dwellings were poor protection against the cold, and most of them perished during the winter, Morton among the number.

For many years a single cedar, bent by the wind, crowned the summit of Merry Mount, as if nature had set a memorial to mark the site of her pagan devotees, and, when the city adopted a seal, it was chosen for a device, with the Latin word *Manet*, "it remains." Today the cedar has vanished from the hill, although its trunk is still preserved in Quincy, but through the pages of Hawthorne and Motley, the May-pole of Merry Mount will always remain in our literature.

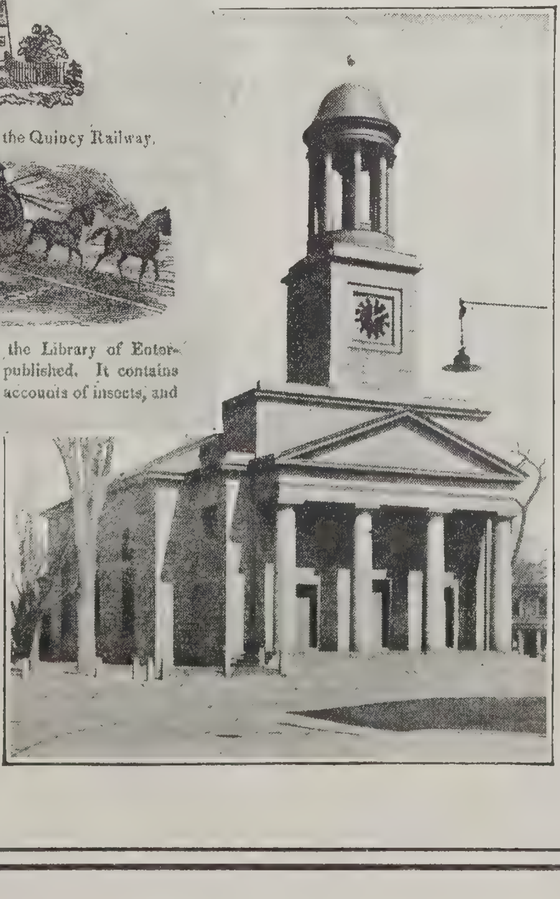


And here is the Monument erected in the Granary Burying Ground, to the memory of Franklin's parents. Several gentlemen contributed to erect this monument, in 1827, as a tribute of respect to Franklin.

Here is a picture of the Quincy Railway.

Another number of the Library of Entertaining Knowledge is published. It contains some more interesting accounts of insects, and

A leaf from an old volume illustrating the first railroad in the United States, the Quincy Railway.



At the right is the Stone Temple.

But "City of Presidents" is Quincy's proudest title, for she has given us two, John Adams and John Quincy Adams. Their birthplaces are still standing, red painted, commonplace farmhouses, almost pathetic in their lowliness and aloofness from the tide of life that sweeps by their doors.

The smaller of the two houses was built in 1687 and is a typical pioneer dwelling, with great beams and fireplaces, and cupboards and niches in unexpected corners, as successive generations made additions to suit their needs. In one room the entire paneling beside the chimney opens outward, with chance to conceal a man behind it. There are a few mementoes of the Adams family, the more appealing because of their meagerness. In the chamber where John Adams was born in 1735 is the cradle in which he was laid, the slippers his wife wore in London, her workbox neatly set in order, and, adding a cheery splash of color, a shawl of vivid scarlet made by the thrifty Abigail from a riding coat worn almost daily by the elder President.

The birthplace of John Quincy Adams is sometimes known as the John and Abigail cottage because here John Adams took his bride and from this house he went forth, "the Atlas of Independence," to take up the lion's share of the burdens of the new government. The boy, John Quincy, bore his part, too, at eleven years old riding horseback to Cambridge where the Continental army was encamped. Evenings he climbed Penn's Hill, beyond the house to see if they were bombarding the British in Boston, and here, on a ledge now marked by a cairn, he watched with his mother the smoke from Charlestown during the Battle of Bunker Hill.

The Adams mansion at the other end of the town is a more comfortable place to visit, for it tells less of the struggles and more of the ease of life. It is sometimes called the Golden Wedding House, for here John Adams, his son John Quincy Adams, and his grandson Charles Francis Adams, celebrated their fiftieth anniversaries. The house was built in 1731 by Leonard Vassall, a West Indian planter who spared no expense to make it beautiful. One room is paneled from floor to ceiling in mahogany. A brook flows through the grounds, and the house, still bearing its air of distinction and gentility, is set back from the street in a park of shade trees. A stone library has been built in the grounds to hold in greater security the books and valuable papers of the Presidents.

Both Presidents with their wives lie buried in the Stone Temple, or First Church, built by a legacy from the elder President. Here illustrious generations of the Adams family have worshiped, together with the Quincys, Josiah Quincy, president of Harvard, with his son Josiah, Boston's "great mayor." No elaborate monuments to mark the Presidents' graves, only simple tablets.

The church itself has a notable history. Gathered in 1636, the first structure was built in 1637. There was an independence of thought in Quincy, not found in any other body of worshipers in New England, for here lived Anne Hutchinson, the ardent young Sir Harry Vane, William Coddington, and others equally venturesome. The Rev. Mr. Wheelwright's sermons were not tolerated by the stern Puritans at Boston. Anne Hutchinson and Wheelwright were banished, Coddington withdrew to Rhode Island where he became the first governor, and Sir Harry Vane left for England where a sad fate awaited him. But the liberal tradition remained in Quincy and in 1750 the church declared itself Unitarian.

As the birthplaces of the Presidents show the hardships of life during the period, and the Vassall house and Stone Temple reflect its dignity, so romance and adventure and youthful love are the atmosphere of the charming Dorothy Q. estate.

The Half-million Mark

WITH the issue of August 4, THE DEARBORN INDEPENDENT passes the half-million mark. This means that in the space of four and one-half years the circulation of this paper has steadily increased until through renewals and new subscriptions it now numbers 500,000 subscribers who have paid their money for the privilege of reading it. It means more than that: on the principle accepted in the publishing world, of four readers to every copy of the paper, the readers of THE DEARBORN INDEPENDENT now approximate 2,000,000 in number. The actual circulation of the main ideas set forth by the paper is really still much wider, because of the freedom with which the press of the United States quotes from its columns.

The pride which may be pardonably evident in the foregoing statement does not grow out of the figures. Mere circulation is not all that a truth-telling paper seeks. It is a notable achievement to have found half a million subscribers in less than five years, but there is something more valuable than Subscribers and that is Readers. THE DEARBORN INDEPENDENT is a paper that is *read*. Its subscribers become its readers, and its readers become its friends. This, of course, could have become possible only on the ground that THE DEARBORN INDEPENDENT is really independent, really honest and really informed in its work as "Chronicler of the Neglected Truth." Its readers have learned to know how thoroughgoing is all its work in search of the exact truth.

As short a time as THE DEARBORN INDEPENDENT has been before the public, it is nevertheless long enough to have tested its more adventurous undertakings to date. Some of its campaigns, bitterly opposed at first, are now conceded to have profoundly influenced the thought of the nation; those who most strongly denied our statements three years ago are now circulating them as the commonplace of information.

Another source of pride is the distinguished roster of readers which we have. It is a pleasure to state that from the subscription list of THE DEARBORN INDEPENDENT could be selected the intellectual leadership of the United States.

The half-million mark is only a halfway house in the history of this paper. By continuing to serve the people with facts and carrying out Ford ideas for the public good, the future growth of the paper is already assured.

Too Much Language

LAST autumn, the Vice-President, went to St. Paul to make a carefully-prepared address, in which he intended to tell the farmers how happy they should be. For some reason, the audience did not consider the speech to be a happy one, and it manifested its disapproval in such a way that Mr. Coolidge was compelled to sit down before his address was completed. A few weeks later, the voters of Minnesota, in a somewhat angry frame of mind, went to the polls and elected Henrik Shipstead, farmer-laborite, to the United States Senate.

Some weeks ago, President Harding, speaking in Kansas, took occasion to marshal in a single speech the list of achievements of his administration with reference to the farmers' welfare. He named several laws, passed by the last Congress, in response to the agriculturists' demand for governmental attention to their problems.

Several of the laws, to which Mr. Harding referred, dealt with the subject of rural credits. The President went into some detail in discussing debentures, margins of difference, re-discounts, revolving funds and other phrases of the financial district which the farm credit laws gave the dirt farmer the right to adopt as his own. He also spoke in feeling terms of the great aid the Fordney-McCumber tariff law had been to the cause of the farmer.

But President Harding's language in Kansas seems to have been of no more avail in convincing the farmer that he is well off than was Mr. Coolidge's unfinished speech a year ago. The voters of Minnesota, to whom President Harding's speech was available for consideration, went to the polls in July of this year, and elected their second farmer-labor Senator, Magnus Johnson.

The farmers of Minnesota were angry a year ago. And they are angry now. They have been given laws by the government, but the more laws they are given, the more difficult their problems grow.

The election in Minnesota should convince the professional politician at last, that the American voter knows what he wants.

For many years, so many that the memory of man runneth not to the contrary, as the lawyers say, the genus politician has lived in supreme confidence that all he needed was language.

Granted that the people had ills, the politician felt that the fever heat of a campaign would be sufficient to banish by election day any personal troubles of the individual voter and cause him to go to the polls and vote the ticket.

Never has the professional politician failed in warmly promising aid to farmer and laborer. For years, impassioned platform addresses during the campaign were deemed sufficient by the politician. But of late he has gone further: he has remembered his campaign speeches after the election, and transformed a few of them into laws.

In Minnesota, however, the voters showed little more confidence in the laws than they did in the promises.

The fact is the American voter is done with language. He wants government to make good. The American farmer wants markets, not speeches. Politicians can no longer swing an election by platform oratory. Neither can they elect their party ticket by remedial laws which do not remedy the people's ills.

Minnesota has spoken. Her voice is the voice of the country. Government has been too long an organization for the perpetuation of officeholders in office. Government must become an organization which will give intelligent aid to the solution of the people's problems.

Not Doing So Well

IT BEGINS to look as if the other great nations of the world might direct their ironical attention to the United States and inquire as to our benevolent administration over small peoples who have come under our control.

Americans were never slow to criticize the great nations of the world for their stewardship of the affairs of subject peoples. We were the first to call King Leopold's attention sharply to conditions in the Belgian Congo. We spoke to the Russia of the Czar about conditions in Poland. We went to war with Spain when we considered her treatment of the Cubans was unjust. We have never been slow to criticize the British Empire's handling of affairs in Egypt, in Ireland or in India.

Recently, however, our extended domains have bubbled with discontent. In Haiti and the Dominican Republic, the rule of the marines and the customs collectors from Wall Street has not been entirely satisfactory to the inhabitants. Porto Rico could not stand the administration of Governor E. Mont Reily, and one faction of the people has protested over the rulings of his successor. And now, the Philippine Islands show signs of discontent.

General Wood recently received the resignations of many of the legislative and administrative officials. The natives who quit their posts charged that the governor had interfered in the purely internal affairs of the islands, which the native officials were competent to handle. General Wood, replying, accused the men who resigned of having acted in concert, as the result of a long-prepared plan to seek independence.

In the absence of all the facts, the American public will suspend judgment. The wisdom of granting the islands immediate independence, or of awaiting a time, when education fits the islanders in a larger degree for self-government, has been widely debated.

Our handling of the affairs of our island possessions may be all right. It may be all wrong. It is probably a human mixture of both right and wrong. So, perhaps, have been the administrations of other nations over their possessions.

Perhaps, the happenings in the Philippines, in Porto Rico, and in the sundry other places where we bear rule, may incline us to be less critical of other great nations in the future.

Bonds Won't Help

PORTO RICO faces the peril, always met by the youth approaching maturity. It is debt. The island wants many things, as a young man entering manhood wants many things. The island believes that the things it wants are necessities. It does not see how it can get along without them. The young man, eager for his place in the world, cannot see how he can get along without the things he deems necessities.

Porto Rico's position is like that of the average young man. Her needs, or her desires, cannot be realized on her present revenues, as his often cannot be attained on his income.

America's bright young possession must go in debt to get the things which an ambitious island needs. A young man on the threshold of manhood must go in debt or go without the things he desires.

Porto Rico's problem is not entirely that of her citizenry. The island is the ward of the United States, not quite a state and not quite a subject-land. The question whether Porto Rico goes further into debt is not alone hers to decide. The influence of the United States will be controlling.

Governor Horace M. Towner, in his first message to the Porto Rico legislature, said that the island's revenues for the next fiscal year would amount to between $11,000,000 and $12,000,000. The assessed valuation of the island is $300,000,000 and the bonded indebtedness is limited to $30,000,000. The present indebtedness is $11,000,000. Governor Towner wants to issue $5,000,000 more in bonds for construction of things he deems the island needs.

Among the projects he proposes to finance by sale of bonds are the completion of the capitol, a new insane asylum, a new penitentiary, a school for blind, community centers, and construction of more buildings and extension of equipment and faculty in the University of Porto Rico. He hopes, also, to use some of the money in establishment of model consolidated rural school systems near model farms.

There will be no criticism of Porto Rico's desire for expansion of her educational system. Neither will there be criticism of her desire to make her public institutions habitable. But it is the part of wisdom for a state or territory to go slow in the matter of creating debts. Porto Rico, by making a twenty or thirty year loan, will be mortgaging the land of a future generation. Some of the things she builds or buys with the proceeds of such a loan, will be obsolete long before they are paid for. It would be better to proceed a little more cautiously in the determination of just what are necessities, and to skimp a little more so that such necessities may be paid for out of present revenues, rather than a future generation should be bound to a mill of this generation's creation.

Pershing's Good Sense

GENERAL JOHN J. PERSHING'S life has been a military one. He is a West Point graduate. He is a veteran of Indian wars, and of campaigns in the Philippine Islands. He led our expedition into Mexico, and was commander-in-chief of our forces in the World War. He is now the guiding genius of the army. If the tragedy of war should overtake the United States within the near future, General Pershing would unquestionably influence vastly our policy.

It would be reasonable to presume that his voice would be raised for the adoption of the strongest measures on behalf of military preparedness.

General Pershing spoke recently at Bear Mountain, New York, to the National Council of the Boy Scouts of America. His address was in opposition to the introduction of military training into the Boy Scout movement. He discouraged the attempt of those who would fill the young minds with the false glamour of war.

Such a speech coming from the head of our military establishment might be surprising. But General Pershing said:

"You are teaching boys to be good citizens, and any man who is a good citizen will make a good soldier in time of peril."

Our chief soldier's life has been devoted to the defense of our country. His mind is ever working upon the best methods of protecting the Flag. He could be excused if the intenseness of his concentration on the subject of national defense had made him over-zealous for preparedness.

But General Pershing seems to have retained through all his military career the sane, calm belief that ours is a democracy, not a militarism. His expert view that good citizens will make good soldiers, if peril threatens, is one which will be hard to combat.

If I Were President!

Henry Ford Tells What His Position Is on All Great Events

By CHARLES W. WOOD

By arrangement with *Collier's*, *The Dearborn Independent* presents simultaneously with that publication this interview with Mr. Ford, obtained by Mr. Wood.

"THERE are approximately 110,000,000 people in the United States," I informed Henry Ford, "and 90,000,000 of them want to know what you are going to do about the presidency."

"Wait here a few days and I will tell you," was his amazing answer.

"Do you mean it?" I gasped. That is what I had gone to Dearborn to get, but I didn't expect it to come to me like this.

"Certainly, I mean it," said he. "You caught me at just the right time. That's the very question I've been thinking about."

As soon as I could recover my breath, I began to mumble some questions. I heard myself using such words as "nomination" and "primaries" and "Democratic Convention." It was thrilling to realize that one could speak such words, right out loud, in talking to Henry Ford. Eventually I made myself coherent—to myself.

"Will you go in for the Democratic nomination?" I was saying. "If not, will you run independently? And what will your platform be? Could you run on a platform created by any political convention in the country? Above all, what do you intend to do if or when you become President?"

"Did you ever sort over a big pile of potatoes?" asked Henry Ford.

"You wouldn't be much use on such a job," he continued. "You'd jump on the top of the pile and get in your own way, and pretty soon you wouldn't know where you were. One of the first things my father taught me was to begin at the bottom, at one end of the pile, and take the potatoes as they come. When you go at it that way, you get 'em all in time. You don't have to worry about those at the top: eventually they'll roll right into your hands."

And Henry Ford kept his promise. He told me exactly what was on his mind and urged me to make it plain to the readers of *Collier's*. There were no reservations. He was a different Henry Ford from what I had ever known before. He talked freely on political subjects. He did not talk like a politician: he talked like a man who had been making a real study of the problems. I spent several days in Dearborn and usually had two or three hours alone with him each day. This was not because of any special liking for me, or any desire to do me a great favor.

"Isn't it a good beginning," I asked, "to inquire what you would do if you were President?"

"No," he said. "That's at the top of the pile. It will roll into your hands in time, but, for goodness sake, wait for it. If you could only forget for a minute that you are a newspaperman, you could see how meaningless some of these questions are. *How does any living person know,* in 1921, what he would do in 1926 or 1927? If I were President in 1927, what I would do would depend upon 1927."

"How would you begin?" I asked.

"I'll tell you how I did begin," he said. "I'll tell you how I began to manufacture motor cars. I began by thinking of something the people wanted which they didn't have. If I had invented an apparatus for shining bald heads, I couldn't have got very far with it. It might have been an ingenious apparatus, and there are plenty of bald heads, but that isn't the point. You have to begin by finding out what the people want. What do the people of America want today?"

"It looks as though they wanted to make you President," I said.

"Do they, or do they just think so?" he asked. "Does anybody want to make me an admiral or an archbishop?

"I'll tell you," he said, "a good way to go at this. You write down three questions and then write out your own answers to them. Do it tomorrow, and then come to me the day after. By that time I think we can do business."

Here are the three questions that Henry Ford gave me:

(1) What do the people of the United States think they want?
(2) What do they really want?
(3) Exactly what is wrong with the country, anyway?

Again I saw a new Henry Ford. Here was a Man of Mystery still, perhaps, but not a man who wanted to be mysterious. He is mysterious because he knows some things which the rest of us don't know; but he has been wanting to tell us, and it was we who wouldn't let him. We have been sticking him in the headlines instead. We have been asking him trick questions and demanding a "Yes" or "No." Ford, meanwhile, has not ignored the clamor. He has seemed to ignore it because he has been trying to find out what it really means. Where does it all belong in the process of social evolution?

Interested in Politics—as a Scientist

A YEAR or so ago, when I interviewed Ford for *Collier's,* I remarked that he didn't dodge political questions, but that political questions didn't hit him. He is an industrialist, I said, and lives on a different plane of existence from that of politics, and he doesn't have to dodge political questions any more than a ghost has to dodge an automobile. I believe that is still true, but it is quite conceivable that the ghost, if he is of a scientific turn of mind, might become interested in the automobile. He might even consider whether it is worth while to materialize and learn to run one.

Today, at any rate, Henry Ford is interested in politics. Not as a politician is interested, but as a scientist. Politics, no matter what one may think of it, is a force to be reckoned with. It uses up time and money and human energy. It even sends people to war. Henry Ford has been trying to learn what it's all about. That he hasn't been going to "political advisers" to discover it is quite understandable. He has been asking those three questions instead.

I tried to answer them in about 3,000 words. They are not for publication, and Mr. Ford himself was only moderately interested. But that I had tried to answer them was enough. It made it easy, he said, for him to talk to me. Ford, the most active man in America, is one of the least busy. When he is interested in a problem, he doesn't begrudge the time it takes to work upon it.

"If the people of the United States," he said, "could only find out what they want, they'd quit worrying about a lot of things."

"What, for instance?"

"Special privileges and all that," he said. "People are forever coming to me with grand schemes to do away with special privileges. The schemes may look all right, but I can't get excited. If the people only knew what special privileges are, then there wouldn't be any. Special privileges are a handicap to anybody. You can't do business successfully if you've got them, or if you spend any time at all in trying to get them. The tariff isn't a graft; it's a nuisance. Unearned money is a nuisance. It's no more fun to be rich and idle than it is to be poor and idle; but you'd think, to hear a lot of people talk, that the great object in life is to achieve unemployment."

"Has that got something to do with your becoming President?" I asked..

Henry Ford's observations are always interesting, but I wanted to be sure that we weren't drifting from the subject.

"It has everything to do with it," he said. "How many Americans, do you suppose, would like to be President?"

"A lot of them think they would," I ventured.

"What for?"

"They haven't thought of that," I said. "Just being President is probably about as far as their imagination goes. They think there is a certain honor that goes with the position. And a President certainly has a lot of power."

"Has he?" asked Henry Ford. "Never mind answering now, but think it over. In the meantime, take the average boy who thinks he'd like to be President—what he really wants is to be a policeman, isn't it? He wants to have authority. He wants to boss somebody else around. He wants to be able to make people do what he says—not that he has any notion of what he wants them to do, but just because he says it. I don't mean that the cops are all like that, but that's what the boy thinks a cop is, and that's why he wants to be a cop.

"The fact is that grown people don't really want this sort of power. It isn't real power at all, but so long as people are childish enough to think they want it, and assume that everybody else wants it, there will be no end of confusion.

"People don't want to run high-power cars until they've got some idea of how to work the levers. And they don't want to monkey with the levers until they know which direction they want to go. If they could only remember this all the time, a lot of things would be simplified.

"But the people think they want to run the Government when they don't know how. They even think it is a sacred duty to vote, when they haven't got a glimmer of an idea as to what they are voting for. They may even think they are running the Government, but they are not. They are all yanking at it here and there, but they aren't running it; and the more they yank, the more it won't run. There isn't any honor in a smash-up. There isn't any honor in being stalled. There isn't any honor in anything except usefulness, and usefulness is based upon accurate knowledge of what to do and how to get it done. Suppose I were elected President and didn't know what to do—what kind of honor would I get out of that?"

There's No Bluff in Industry

I SAID it was a new Henry Ford who was talking now. At least, I had never before heard him laying down the law like this. It must be remembered, however, that this is the first time in his life that Henry Ford has applied his mind to politics in order to satisfy himself as to just what it is.

"If the people can get these few truths into their thinking," he added, "a lot of their political problems will disappear. They won't have to be solved. There'll be a fade out, and folks won't be scared by them any longer.

"When they learn that special privileges are a fake, they will tell everybody they know. It will soon become *generally known,* and then nobody will try to get them. When they learn that there isn't any honor except in usefulness, then they'll all want to go to work. When they learn that simply being rich is about the stupidest aim that anybody could have, they'll begin to look around to see what they can *do*. Incidentally, then, they'll become rich."

Mr. Ford left the office a few minutes and when he returned his mind seemed to be dwelling on another subject. I learned very soon that it wasn't.

"You can't bluff much in modern industry," he said. "You may ordain a man to be a bishop, but you can't ordain him to be an electrician. In order to be an electrician, he's got to find out for himself just how electricity acts. Modern industry is based upon modern science, and in science a fact is the only authority that amounts to anything.

"But politics was invented before the scientific era, so politics and industry can't travel along exactly the same lines yet. The industrialist has to find out what the people want and get it to them. The politician can still content himself with finding out what they think they want and promising it.

"The industrial organism is stronger and healthier than the political organism. It has more life flowing through it, more energy. Wouldn't wonder if industry would eventually absorb the political government. But not yet a while. These things take time. If there is some big, silly, utterly useless tribunal installing itself in one of our factories, I could dynamite it out of there in ten minutes. But suppose I were President—I couldn't step out some Saturday night and fire the Supreme Court."

The potatoes were beginning to roll down just as he said they would.

"I certainly couldn't run the Government the way I run my business," he went on. "There's a heap of waste in government. There's a foolish lot of overhead. Just suppose a motor factory were organized into forty-eight different squares, with imaginary lines running up and down across the floors, and different rules and different sets of officials on each side of all the imaginary lines—why, I'll bet cars would cost a million dollars apiece, having to manufacture them in any such way as that. Yet, when we think of government, we take it for granted that there must be forty-eight States.

"The government departments and bureaus and divisions and subdivisions also take on a character of permanency that looks funny to a manager of industry. In order to achieve a specific aim, it establishes an institution—and it tries to keep that established institution intact forever after. Industry thrives through discarding institutions the minute some

Concluded on next page

more efficient scheme is hit upon. But government keeps up establishing bureaus to account for the money it spends establishing bureaus.

"Politically we not only keep all the old truck around, but we make it sacred. We speak in awe of our 'form of government' and even pass laws making it a crime to criticize it. You can't imagine an industry thriving if it considered its form of organization beyond criticism."

"Would you substitute autocracy?" I asked.

"No," said Mr. Ford.

"What could you do?"

"I could watch it and see how far it would go. Something is going to happen to it one of these days, but I don't know which one. It won't be an explosion, it will be evolution. Society is evolving toward the industrial idea. We are evolving from the notion of authority to the principle of accurate knowledge. We are evolving from the law of fear to the law of service. Efficient service demands that we get rid of things that have outlived their usefulness. If the Government doesn't do this, the Government will go down, that's all. If America doesn't do this, America will go down. But I'm an optimist. I'm sure we're going to get rid of all these dead cells as soon as the time comes to get rid of them."

An Embalming Fluid Called "Finance"

YES, we have made no references to the Jews today; about no interview with Henry Ford is complete without one. That is the one subject upon which I found it most difficult to get his point of view; and, naturally, I wanted to side-step it entirely. It really can't be done. References to "the Jews" were sprinkled quite generously throughout our entire talk.

Mr. Ford laughed at the newspaper dispatch which announced that he, through agents in New York, had tried to "make peace with the Jews." He says he has never made war against them; and I, at least, could never discover any of the ordinary varieties of anti-Semitism in his attitude. While his position has been very hard for me to understand, I am sure that it does not suggest either hatred or fear.

"When the Jews take hold of anything, it goes down," was one of his commonest observations.

"What do you mean by Jews?" I asked.

"The International financiers," he said.

"Then why not say international financiers?"

Sometimes, after that, he did, but just as often he didn't. "The Jews," he told me, "are ordained by God to clean up the things that are ready to disappear." Then, as though he were merely repeating himself: "These Jew financiers are not building anything. They wait until things begin to decay; then they get into them."

I spent hours with Henry Ford, not arguing this question, but trying to get his point of view. All at once it dawned on me. Perhaps he didn't say anything that he hadn't said before, but he used terms which I could understand.

"Any business," he said, "which is doing a necessary social service ought to be able, as a general thing, to finance itself, just as any man who is working steadily ought to be able to keep out of debt. Unless there is some laziness—unless somebody is lying down on the job—an industry is not apt to get into a fix where it needs help. But the minute it does slow down, or tries to expand abnormally, the Jews sense it. They are keen-scented watchdogs in this respect. Any institution which has ceased to progress belongs by rights to them and they prepare to take it over. Pretty soon you will find them injecting their wonderful embalming fluid into it which they call 'finance.'

"You probably think the labor unions were organized by labor, but they weren't. They were organized by these Jew financiers. The labor union is a great scheme to interrupt work. It speeds up the loafing. It's a great thing for the Jew to have on hand when he comes around to get his clutches on an industry. Look at the coal business if you want to see the way that the labor unions work with the financiers to paralyze an industry. The coal business—that is, the railroad end of it, the financial end—isn't organized to mine coal and get it to the people. If it were, it would be paying high wages, and the people would be getting cheap coal. Half the time, however, it isn't paying any wages, and the people can't get any coal.

"A few years ago," Mr. Ford continued, "there were people in our organization who thought we would have to borrow money; and the Jews were right there. What do you suppose the real trouble was? The war had dislocated things in the organization so that there were a lot of places where energy wasn't flowing very freely. We cut out the loafing, and things straightened themselves out nicely. I want to tell you that we are not going to have any foolishness to take the place of work on our railroad. I have told the labor unions and the brotherhoods that the only thing we will deal with is labor; and the only organization we will recognize is the organization of work.

"I haven't talked much politics yet, have I?" he began in our next conversation. "Well, I'm coming to it. In order to make any head or tail out of anything, you've got to see it from the standpoint of evolution. A thing comes into existence when it's needed, and it goes out when it's ripe and ready to go out. Now, if I am going to run for President, I've got to have a platform, haven't I?"

"In such a crisis as the present," I concurred, "it seems that there must be a platform. The people are fairly yearning for one."

The Summary of a Platform

SO WE talked about this platform. A platform is supposed to be a statement of principles; and I confess that a statement of Henry Ford's principles in political language is rather beyond me. But here is a digest of that conversation, as near as I have been able to translate it into platformese:

PREAMBLE—*All that America needs is the freest possible play of American energy. In the life process, organizations are eliminated as soon as they have ceased to function, in order that better organizations may arrive and function in orderly fashion. But since evolution is not under congressional supervision, we wish to assure the American people that they are getting about what's coming to them, and that there won't be much improvement until it is time for it. President Harding is doing as well as can be expected, and Congress has not yet marred the design of the universe.*

International Relations—International difficulties result from misunderstanding, and the best way to get along with other people is to get acquainted with them and with ourselves. Europe is in a bad way today because Europe doesn't know anything, and therefore isn't working. As soon as Europe discovers that it is Europe, its people are likely to quit being merely nationalists and become Europeans. Then they will in all probability go to work. The United States cannot be of much assistance to Europe in the present crisis, first, because of the narrow nationalism of Europe, and, second, because of the narrow nationalism of the United States. We promise our constituents, however, that this wrong will be righted just as soon as the truth becomes generally known that the real interests of people in various parts of the earth do not conflict.

The Tariff—The tariff is a joke, but it is apt to hang on, to the detriment of both American and foreign countries, until the people learn that special privileges do not pay. Our nation needs no special privileges and won't be perfectly happy until it settles down to doing that share of the world's work for which it has the greatest natural capacity.

Ship Subsidy—Giving a bonus for incapacity is a brilliant procedure, provided our object is to waste money and keep the world's work from being done. Wealth can be produced so easily that there need be no great cry concerning expenditures, but our objection to the ship subsidy is that it would seriously hamper shipping.

Soldiers' Bonus—The proposal to give a bonus to veterans of the late war implies that the soldier cannot hold his own in competition with others, and is an insult to the ex-service man. If the ex-service men are unfitted, because of wounds, or other disability, for the normal competition of life, they should be made fit immediately, and all the resources of modern science should be devoted to the task.

Agriculture—The great trouble with farming is that it involves too much unnecessary work. There is no reason why agriculture may not hope to come abreast of the other industries in the near future, if the farmer will turn his attention to modern industrial methods instead of to the problem of borrowing money. There is no food scarcity. The problem is not one of how to increase production, and thereby pile up a surplus for speculators to play with, but how to simplify production and distribution so that less human energy shall be wasted in the process.

Railroads—There should be a railroad system in the United States instead of the antiquated network of financial corporations which take toll along the nation's highways today.

The Government seems to be the only agency in sight with power to establish such a system, and it looks as though the Government would do so presently. Whether we shall have an actual railroad system then, or further trouble, will depend much on whether the Government tries to run the roads from the floor of Congress or hires somebody who knows how to do the job and lets him do it.

Prohibition—Booze had to go out when modern industry and the motor car came in. Upon only one condition can the nation safely let it come back. That is, if we are willing to abolish modern industry and the motor car.

Peace—The only way to assure world peace is to give world service. Incidentally, this pays enormously; but, until the people find it out, we may enjoy the luxury of continued fighting.

Perhaps Not the Time to Do Anything

ALLOWING for certain licenses of translation, that is Henry Ford's platform about as he gave it to me. "Do you think you could run on that platform?" I asked.

"Run what?"

"Run for the presidency."

"That's so," he said. "We were speaking about the presidency, weren't we? I have no fault to find with President Harding."

"What has he done?" I wanted to know.

"That's just it," said Henry Ford. "Maybe it isn't time to do anything yet. If that's the case, the best man for the job is the man who can be depended upon not to do anything. I know Mr. Harding. He reminds me of a cautious, big elephant who always puts his foot on a plank and tries it before he risks going ahead. That's the type of man to have until the time arrives for rapid change."

"But why didn't you make this plain before?" I asked.

"It wasn't time for it," he said.

"But you have knocked American politics sky high," I protested. "Millions of people are looking to you as a Messiah. It can't be any fun for you to string them along for months, and then spring such an announcement as this. You could have the Democratic nomination for the asking."

"And what could I do with it?"

"You could probably be elected President."

"And what could I do as President? Could I carry out that platform?"

"Perhaps not," I admitted.

"Well, we *are* carrying it out," he said. "We have been releasing some little energy in the United States. We have been sending motor cars and tractors all over the world, and everywhere they go—Mexico, Russia, China, or whatever country you can name—roads are built and the people get acquainted with each other, and State and national boundaries begin to fade.

"We haven't been able to repeal the tariff, but we have demonstrated that special privileges aren't worth having. We are co-operating joyously with the ex-service men. We are finding ways to develop agriculture. We are even enforcing prohibition, when we manufacture motor cars. Incidentally, we intend to make a demonstration of what a real railroad may be like.

Get Rid of Politics and Finance

"WHY, everywhere I turn on a job like this, and I see something that ought to be done, I seem to discover some way to do it. But there's Harding. When he sees something that ought to be done, where is he? It seems to me that a man like me ought to stay on this job and a man like him on that. I don't see any more sense in making me President than in making him head of our research laboratory.

"Now, if I wanted to play politics, I would say exactly what I am going to say, anyway. But I am not playing politics. I am not a candidate for anything. I can't imagine myself today accepting any nomination. Of course I can't say what I will do in the future. There might be a war, or some crisis of the sort, in which legalism and constitutionalism and all that wouldn't figure, and the nation wanted some person who could do things quickly. What I would do then I can't say. But there isn't any such situation now. I haven't a political mind, and I don't see any sense in my attempting any political leadership."

"But Harding stands for the ship subsidy and the tariff and private ownership of the railroads," I reminded him.

"But Evolution is on the job," he replied. "Harding blocked the soldiers' bonus, and Congress blocked the ship subsidy. Altogether, things are happening about right, and you've got to give them both credit for it. A lot of people are impatient for things to happen faster, but things don't happen fast in politics. Not until we get out of the political era can we expect big changes. While we are in it, let us by all means have such men as Warren G. Harding."

That is Mr. Ford's position. I hope I have made it clear. It is more than a declination to become a candidate. Declinations may be overruled by public clamor, but a straight statement of the truth cannot. So long as politics are what they are, Henry Ford simply cannot hold a political position. He is not a Democrat. He is not a Republican. And he has no notion whatever of creating another political party in order to do things that political parties cannot do.

Things don't happen by means of political parties, he is sure. At least, not Ford things—not the things that happen where Henry Ford and his ideas are at work. It is the Harding sort of things that come out of political action—the things that a man can be ordained by the proper authorities or elected by the people to do.

"I know, if the people don't, that that isn't my kind of a job. It is as silly to talk of drafting me as it is to try to make me volunteer. I've got a job now—my kind of a job. Watch the D., T. & I for the next few years. We are going to make a real railroad out of that, and show the country what kind of a transportation system it might have if it would quit thinking in terms of politics and finance and get down to work."

"Army Bill" Herschell Doesn't Wear Long Hair

Hoosier Poet Thought of by Many as Worthy Successor to Riley

By J. M. SEABRIGHT

THE scene is a little red schoolhouse in a village of Indiana; the time is the year 1885; the characters, a mean schoolmaster with a blunt sense of humor and no nose for future greatness, and a barefoot boy named William Herschell, destined to be thought of by many as James Whitcomb Riley's successor in the esteem of "Indiana Folks," who had been unjustly accused of stealing the teacher's puppy of uncertain lineage, answering to the name of Jim. Despite his dubious parentage, Jim was prized highly by his irascible owner; and that warped sense of values in his master probably had something to do with the injustice of the accusation.

So the fact that Jim had been found in the Herschell back yard the day before appeared, to the wielder of the ferrule, sufficient evidence—even though circumstantial—of his guilt. It thus happened that the object of his wrath was made to stay after school and to listen to his accuser. The utter falsity of the charge sank deep into the youth's subconscious self and opened the wellsprings of a suitable defense. And that defense assumed a peculiar form: it proved that the pen is, in truth, mightier than the sword. For the day following, during the daily session with the Spencerian copy book, the schoolmaster lost his equilibrium when he read, over the boy's shoulder, the following original outlet of pent-up emotion:

Teacher says I stole his dog;
  But why should I steal Jim,
When teacher's with me all day long
  And I can look at him?

The burgeoning genius of William Herschell was thereupon temporarily checked by the frost of the teacher's wrath; but, since it required more than an unappreciative Ichabod to kill entirely, the blossoms, even if tardy, came forth eventually, fostered by the warmer, more genial, atmosphere outside curricular walls.

Herschell's parents, however, were likewise unable to detect the thread of poesy running through their son's make-up, and the father, being a railroad blacksmith, ordained him for his own calling.

His entry into that form of employment did not come till three years after the incident of his first bit of verse. Dramatic was the departure of this 15-year-old boy, the eldest of six children, from the sphere of the classroom. The family then resided in Huntingburg, a strongly Democratic town; and—young Herschell was a steel-ribbed Republican! One night, in a torchlight parade, he carried a banner reading: "A Vote for Cleveland Means Souphouses." The next morning the school principal announced that "inasmuch as William Herschell had gone into politics he could not possibly wish further education." Accordingly the youthful martyr to political principles was apprenticed in a railroad shop where he remained until 1894, when, with the beginning of the American Railway Union strike, he joined the forces of Eugene V. Debs and became secretary in the organization. At the conclusion of the strike, finding the railway shops closed to him, he worked his way from Chicago to Buffalo on a Grand Trunk stock train, and then went to Canada, where he found employment for a time. Upon his return to the United States he worked in an electric light plant at North Tonawanda, New York, and in a Buffalo contract shop. Then he wandered back to native soil and entered journalism.

Worked on Hoosier Papers

FOR three years Herschell earned a meager living as a general factotum on the Princeton *Evening News*. Came a day when the proprietor of the paper was reduced to borrowing enough wrapping paper from a butcher to get out the issue, which was labeled, "A Souvenir Edition Dedicated to Our Creditors." Naturally the *Evening News* was soon absorbed by another paper, and Herschell went to the Evansville *Journal*, then, in 1900, to the Indianapolis *Press*, and later to the Terre Haute *Tribune*, the Indianapolis *Journal*, and, finally, 20 years ago, to the Indianapolis *News*, where he has remained ever since. His first work on the *News* was as a police-court reporter, and in 1904 he started writing features. In 1911 he hit upon the idea of composing simple verses about street urchins, firemen, policemen, draymen, lame dogs, and other familiar objects of city life. They appeared weekly under the caption, "Songs of the City Streets," and he soon added country life to his world and wrote "Ballads of the Byways."

The readers of the *News* soon came to look forward to Herschell's weekly feature. They tasted therein the flavor of James Whitcomb Riley, beloved of people everywhere. The Riley tang became more pronounced as Herschell grew in his art until one can say, with little fear of contradiction, that in the eyes of the home folks he now wears the mantle of his illustrious fellow Hoosier. Riley is immortal for "The Old Swimmin' Hole," yet the following, "A Creekside Comedy," has much of its reminiscent quality:

Sometimes I like th' Winter best,
  Then sometimes Spring an' Fall,
But mostly me an' Pizen thinks
  Ole Summer beats them all!

We call him Pizen 'cause, you see,
  He gits his feet all sore
From pizen vines—an' then he can't
  Go barefoot any more.

Ole Pize an' me has lots of jokes
  In summer time when we
Go swimmin' in th' swimmin' hole
  Down by th' willer tree.

We start a-takin' off our clo'es
  Before we're nearly there
An' then I holler: "Last one in
  His dad's a grizzly bear!"

An' 'course his daddy's allus it,
'Cause Pizen can't begin
To git his shoes an' stockin's off
  Before I'm divin' in.

Then Pizen he gits even when
  He takes th' clo'es I've got,
An' soon's I'm divin' in th' crick,
  He ties 'em in a knot.

An' when we're done a-swimmin' he
  Goes 'hind some tree to hide
An' yells "Chaw beef!" when I have got
  To chew my clo'es untied.

Then soon as we are both dressed up
  We stand around an' grin
Till both, without a single word,
  Strips off—an' goes back in!*

What He Thinks of Indiana

HERSCHELL'S poems can be grouped under two main heads—dialect and non-dialect verse. Of the former, two prevailing types reveal themselves—those written in Hoosier and those in Negro dialect; and each group can be further divided into adult and juvenile rhymes. While it is true that the poet possesses the superb faculty for reproducing our childhood joys—a gift which has lifted him above many more ambitious contemporaries—one must not lose sight of the fact that a poem for grown-ups has, perhaps, brought him the most renown. "Ain't God Good to Indiana?" also bears indelibly the Riley stamp:

Ain't God good to Indiana?
  Folks, a feller never knows
Just how close he is to Eden
  Till, sometime, he ups an' goes
Seekin' fairer, greener pastures
  Than he has right here at home,
Where there's sunshine in th' clover
  An' there's honey in th' comb;
Where th' ripples on th' river
  Kind o' chuckle as they flow—
Ain't God good to Indiana?
  Ain't He, fellers? Ain't He though?

Ain't God good to Indiana?
  Seems to me He has a way
Gittin' me all out o' humor
  Just to see how long I'll stay
When I git th' gypsy-feelin'
  That I'd like to find a spot
Where th' clouds ain't quite so restless,
  Or th' sun don't shine as hot
But, I don't git far, I'll tell you,
  Till I'm whisp'rin' soft an' low:
Ain't God good to Indiana?
  Ain't He, fellers? Ain't He though?

Ain't God good to Indiana?
  Other spots may look as fair,
But they lack th' soothin' somethin'
  In th' Hoosier sky an' air.
They don't have that snug-up feelin'
  Like a mother gives a child;
They don't soothe you, soul an' body,
With their breezes soft an' mild.
They don't know th' Joys o' Heaven
  Have their birthplace here below;
Ain't God good to Indiana?
  Ain't He, fellers? Ain't He though?†

Herschell's versatility is further exemplified by his war poems. No other poet caught the spirit of the doughboy as did he; no other so got "down into our stomachs and our feet," as one veteran has put it. His songs lightened many a heart and pack. They smoothed the way to splendid victory. On the rungs of such verses as "Long Boy," of which 1,500,000 copies have been sold, "The Service Flag," the national song of the War Mothers, and "Huh-uh! Not Me!" he has risen to new heights of fame. They have served a double purpose: they have broadcast his talents; they have, at the same time, endeared him to ex-service men throughout the land. To them he is known as "Army Bill" Herschell; he wants to be their buddy—and he is!

WILLIAM HERSCHELL

In appearance, in personality, Bill Herschell fills the popular conception of the poet but poorly. No shell-rimmed glasses, no long hair, no cadaverous expression, characterize him; instead, you will find a jovial fellow with a 200-pound physique, over which is draped a modest gray business suit, like that of a country banker—a human volcano belching forth wit and humor. Wherever he goes, he is the life of the party. Moreover, he refuses to carry his handkerchief in his cuff, and he gets his hair cut once a week. He has a deep bass voice, enjoys a fast prize fight, and prefers vaudeville to grand opera. There is nothing highbrow about him; he is as plain and unaffected as the people of whom he sings.

A significant, a memorable, event in Herschell's life occurred not long ago in the city of Greensburg, Indiana. The occasion was his 49th birthday anniversary. Joe Welsh Post of the American Legion planned a unique celebration in his honor, November 17 of the past year. "Army Bill" was to be given the opportunity of seeing in what regard his ex-service friends held him. Gathered round the banquet table, graced by a huge cake bearing 49 candles, were notables from the four winds, among them being National Commander Owsley of the Legion and Kin Hubbard, the creator of "Abe Martin."

Why They Are Buddies

WITH his accustomed facility, Herschell, that night, at the conclusion of Commander Owsley's touching tribute, with tears in his eyes and swaying with emotion, read a new composition dedicated to the Legion. "Why Do They Call Them Buddies?" is destined to live along with the memory of those who gave "the last full measure of devotion":

Why do they call them Buddies?
  What other name as sweet
Has ever been war-hallowed
  By rain and snow and sleet
What other name than Buddies
  Would men like our men bear
When hell belched its baptisms
  And death was everywhere?

Why do they call them Buddies?
  Though not of common kin,
Old Glory called them brothers
  When Freedom said: "Go in!"
They swept in mighty legions
  To man land, sky and sea;
Gob, devil-dog and doughboy—
  A fighting trinity!

Why do they call them Buddies?
  Because they stand today,
Still Buddies to the Buddy
  Left shattered by the fray.
Though Peace may grow unmindful
  Of War's unsettled debt,
The Buddy to a Buddy
  Stands fast—and can't forget!

That's why they call them Buddies!
  The shrapnel's shriek is gone,
But still, beneath Old Glory,
  The Buddies carry on!
And so, tonight, heart-happy,
  I breathe this fervent prayer:
  God make the way all roses
  For Buddy Legionnaire!

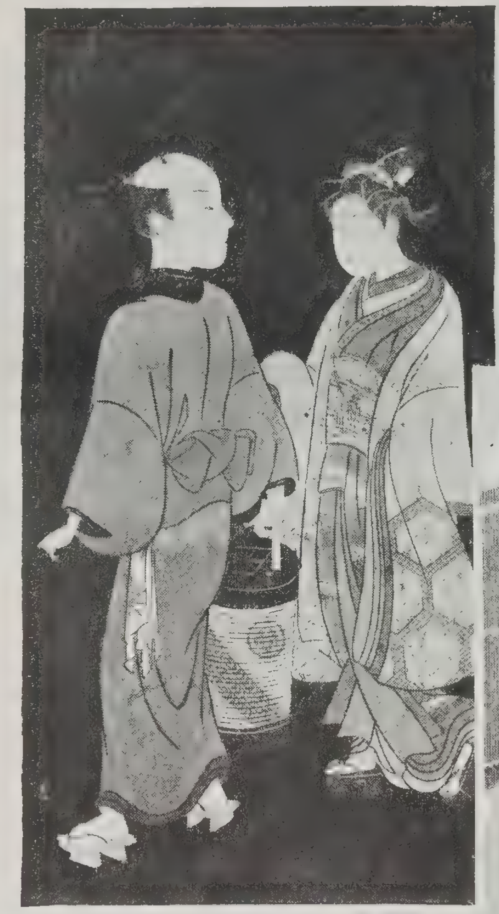
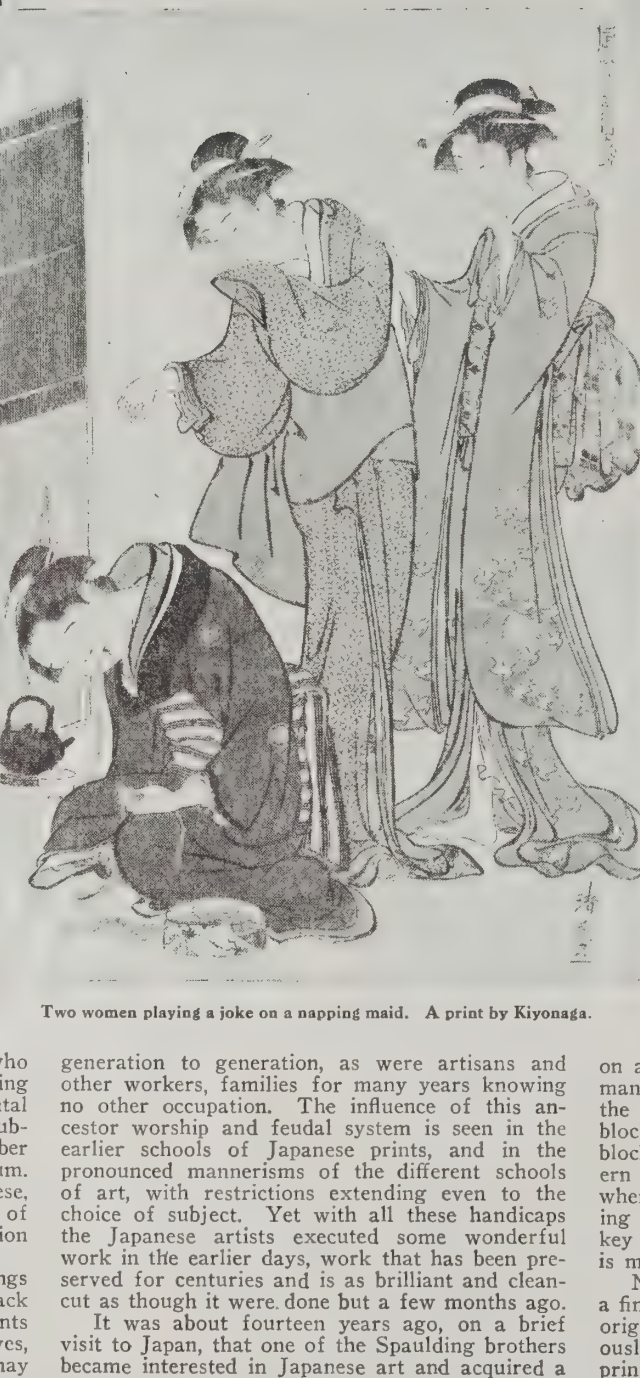
A Priceless Collection of Japanese Prints

Art of the Far East Gathered for Years Goes to Boston Museum

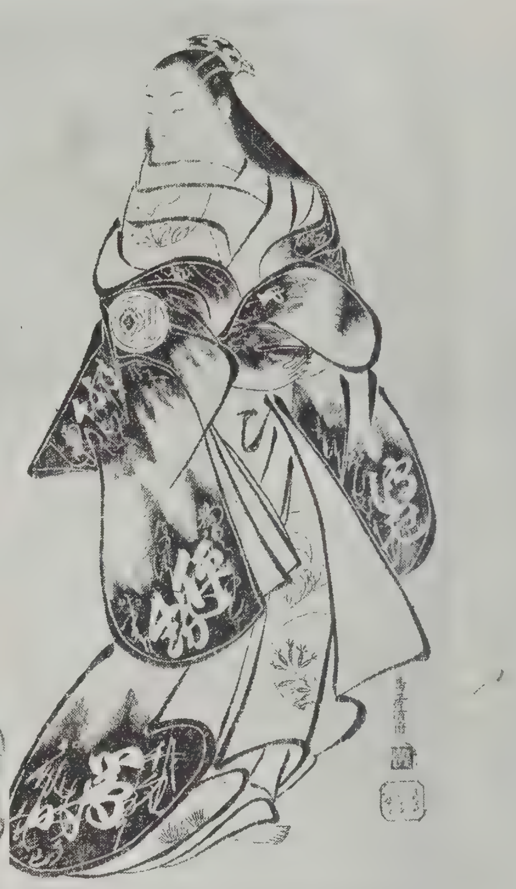
By F. N. HOLLINGSWORTH



A man escorting a geisha. This is by Haronobu who perfected the art of color block printing.



Two women playing a joke on a napping maid. A print by Kiyonaga.



A print of an actor in a woman's part. This is one of the earlier prints done in black and white.

THERE has just been given to the Boston Museum of Fine Arts to add to its already splendid collection of Oriental art, including Japanese prints, a priceless collection of these prints, some six thousand in all, comprising the finest and most complete assembling that ever existed in private hands, or anywhere outside a museum. This is the famous Spaulding collection, and the donors are two brothers, wealthy Bostonians, William S. and John T. Spaulding, who have been collecting them for years, ransacking not only Japan but the whole world for choice specimens, and often buying entire collections only to retain a few of the best in the lot that they wanted.

Other generous donors of these prints in the past have been Dr. Denman W. Ross, who has done more than any other American to bring to this country an intimate knowledge of Oriental art and is one of the great authorities on the subject, Dr. William Sturgis Bigelow and a number of other friends and benefactors of the museum.

With the Spaulding collection added to these, there is now in Boston the greatest collection of Japanese prints in the world, and a collection greater than those of all others put together.

The collection dates back to the very beginnings of the print art of Nippon, from the earliest black and whites down to the time when color prints were at their zenith of fame. To some eyes, Japanese paintings, particularly the prints, may seem grotesque, and due to the difference in style of drawing, in them may be found a wonderful harmony of line and color, delicacy and precision of drawing, combined with an infinite variety of pattern and treatment, and a striking composition that makes them a constant delight to the beholder. They are wholly unlike western drawing, to be sure, but to the student of art, especially Oriental art, and to the Oriental himself, they are full of meaning and shades of expression, conveying a story as graphic as the work of any Occidental artist.

In the art of the Far East, certain pictorial subjects apart from religious themes are frequently to be found. Each bears a well-selected, if sometimes somewhat poetic title, that has come to be regarded as a classic. Orientals not only view the old and the past with reverence, but seek the past for inspiration, and in Japan, from the beginning of the Empire down to the reformation; this tendency was especially marked, as it was in China, the entire social fabric of both countries having been erected upon a system with which ancestor worship was closely allied.

Even the artists were not free from this, and the feudal system, which dominated the island kingdom for many generations, penetrated even the realm of art. Hence artists were trained from generation to generation, as were artisans and other workers, families for many years knowing no other occupation. The influence of this ancestor worship and feudal system is seen in the earlier schools of Japanese prints, and in the pronounced mannerisms of the different schools of art, with restrictions extending even to the choice of subject. Yet with all these handicaps the Japanese artists executed some wonderful work in the earlier days, work that has been preserved for centuries and is as brilliant and clean-cut as though it were done but a few months ago.

It was about fourteen years ago, on a brief visit to Japan, that one of the Spaulding brothers became interested in Japanese art and acquired a fine Hiroshige print, which became the nucleus of their costly collection. From then on their enthusiasm grew, and they became known as the foremost private collectors of these prints in the world. They were discriminating, and sometimes, out of a whole collection bought, but a few or the rarest and most perfect examples would be retained, so that the collection as a whole stands as well-nigh perfect. It includes, besides the many color prints, some specimens of the earliest forms of Japanese pictorial printing, in black and white, before color blocks were used.

In the earlier days of the Empire, painting and embroidery, which formed the chief portion of Japanese art, were mainly accessible only to the upper classes—the aristocrats and wealthier families. But toward the end of the seventeenth century there began to appear men who, though looked down upon by the court artists of the day—the pampered favorites—made rough copies of paintings and sold them for almost nothing to the common people. Gradually they began to make sketches of life as they saw it around them, and then made from these drawings wooden blocks from which many copies of the same picture could be printed. After pulling the prints they filled in the colors by hand, usually with but two colors, rose and green. In the Spaulding collection are some of these earlier hand-colored prints, as well as the original black and white block prints. One of these is of an actor, by Kiyomasu, in a woman's part.

To an artist named Haronobu, flourishing from 1704 to 1715, is attributed the perfecting of the process of printing from blocks in several colors, if not the originating of the actual idea. He achieved wonderful results. To be sure, two other artists always had much to do with the development of the process in the case of every print, although their names never appeared upon them.

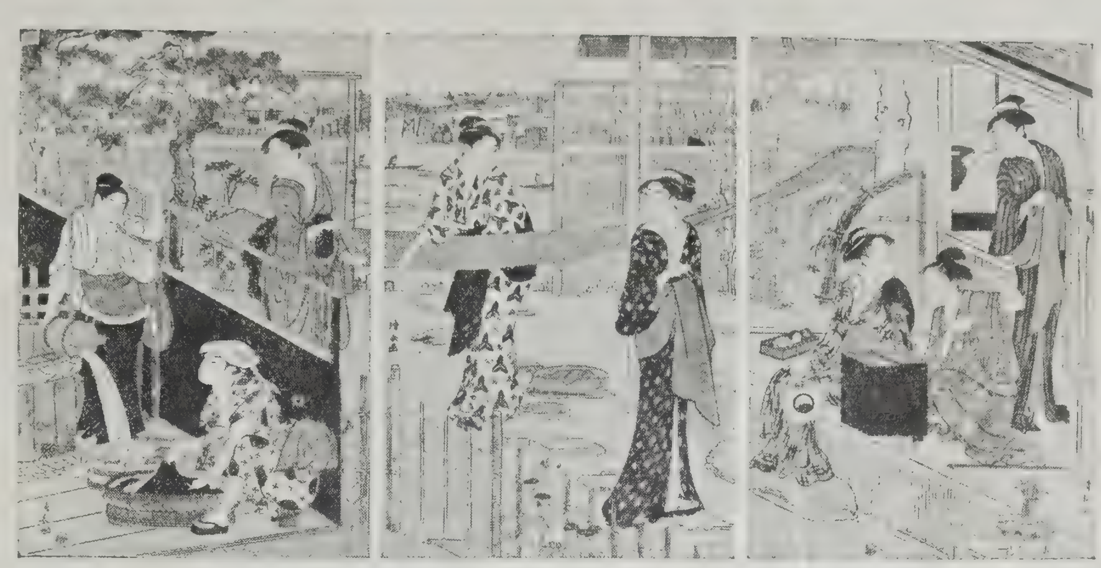
In the making of a print, the process was as follows: First, the artist, whose name was the only one that appeared on the print, composed his picture and drew it in outline with a brush on transparent paper. This was then pasted face down on a block of hard cherry wood and the second man, the block cutter, cut away with a sharp knife the wood on either side of the lines, leaving the block ready to print. If color was to be used, a block for each separate color was cut, as in western lithography and other color process work, where several plates have to be made, corresponding to the colors to be printed. In addition, a key block was cut for the outline, as a key plate is made for the modern color printing.

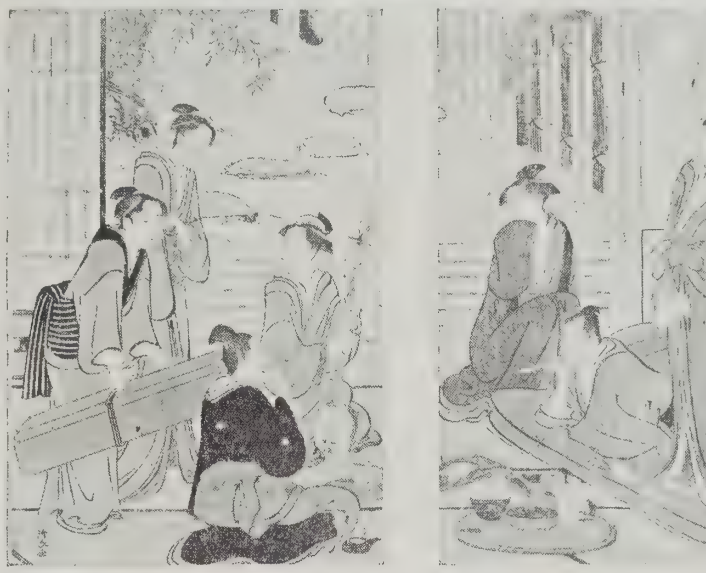
Not only must the Japanese block cutter have a fine, delicate sense of color to follow the artist's original color scheme, but he must be marvelously accurate in his cutting, so that the block printer can secure accurate register. And the block printer must be equally careful in his matching of the blocks to secure the correct laying of color without the variation of a hair's breadth in the register on the completed print. It is exactly like the present-day revived process of wood-block printing, which has come into vogue of late, but those old Japanese artists secured results which no latter-day block printer has yet attained.

Another feature of these old prints, to be noted in the museum's collection on careful examination, was the use of "gauffrage," or blind printing, by which is meant the cutting away of the surface of the block in some places without the application of color to these portions, so that when the damp paper is pressed upon the block, a slightly raised or bas-relief effect appears. This was used sometimes to depict such detail as the feathers on the wing of a bird, or a pattern on a robe, and gave richness and delicacy to the print.

These color prints became widely popular with the Japanese people, especially as they more and more reflected their own daily life; and the art reached its greatest heights in the middle of the nineteenth century, from which time it gradually deteriorated in quality with the attempt to increase the number of blocks, the use of imported colors, and probably through carelessness in printing.

In the Spaulding collection are not only all





Above--Washing day. Below—A young man being entertained by geisha.

the important artists of the so-called golden or middle period, but each is represented by a wide variety of kind and quality. This is true also of the work of later artists, such as Hiroshige, Toyokuni and his school, and Hokusai. In this collection and others owned by the museum are rare prints collected by Professor Fenellosa, Baron Sumitomo, Colonel Appleton, Frederick W. Gookin, Frank Lloyd Wright and Dr. Clarence Webster.

The Spaulding gift to the museum is very complete in sets by different artists. Kiyonaga (1752-1815) is well represented, for example. This famous artist was very fond of making blocks in diptych or triptych form, each block being a separate and beautiful arrangement, yet the whole series forming a continuous design. His drawing was very fine and his coloring refined, with settings of blacks of fine quality and harmonizing backgrounds. Often the parts of these two and three-block prints would become widely separated in the course of years and one part might turn up in one quarter of the globe and another in some other man's collection, with thousands of miles between them. One gem of the Spaulding collection is a Utamaro triptych—the Owabi shell diver, which took two years' search to complete and was assembled from all over the world. The Kiyonaga prints, especially the multi-block prints, are the most difficult to obtain, practically all existing ones being in some collection.

The collection is also wonderfully rich in examples of Hiroshige, one of the most noted of the Japanese print artists, and the first one represented in the Spaulding collection. One of the museum treasures is the only complete set known of twelve landscapes which it is thought were made as a New Year present to some rich patron. All are views around Tokyo, and are perfect in detail, with no loss of simplicity in effect. They are panoramas, showing rice fields, irrigation ditches, little bridges, rows of trees and other scenes. Another set of eight, made in 1830, of the same general series of subjects, gives us an idea of Tokyo and the countryside surrounding it at that time. Hiroshige was a wonderfully versatile artist, as shown by his other lifelike studies of birds and flowers, and humorous sketches.

So thoroughly has Japan been ransacked for these prints by collectors and by dealers to satisfy collectors that some of the works of the old masters can hardly be found. Until recently, the Japanese museums themselves had but little use for them, looking down upon them as something too common, although one of the great authorities on the subject was a Japanese who was curator of the Japanese art collection at the Boston museum for a number of years. Recently, a Mr. Matsukata, who has been in America and Europe buying paintings for the new museum at Tokyo, seeing how highly the prints of his own country are valued and appreciated by Occidentals, has become convinced that his own museum should include them in its collections. He will find it difficult to obtain a selection, without buying from western collectors.

The Japanese print artist, in his work, not only reproduced the pictorial effect of an action, but had a way of emphasizing this action, or those elements that appealed to his fancy. This will be noted in the snowflakes, the slant of rain, or the branch of a flowering tree, the soft folds and delicate colors of a garment—these being more important in his eyes than the motif of the picture itself. Often, too, he disregarded the laws of perspective or those of anatomy, turning heads completely around on their shoulders to make his figures look behind them—all if he thought he could tell his story better by doing so.

Perhaps the most interesting prints in the collections are the studies of everyday Japanese life. People everywhere are interested in the doings of others, especially those around them, and if they see a bit of drawing or a painting that depicts some phase of their own or neighbors' existence, it interests them more deeply than such sculptures as the Venus de Milo, or the world-famous Gainsborough ladies or the "Blue Boy." Witness the "Angelus," which can be found in more forms of reproduction and more places in the world than almost any other painting. So with the Japanese prints that picture commonplace subjects like the woman hurrying to take in her clothes out of the rain; children with their paper boats and hobby horses, on a windy day; a mistress and maid in a dispute over the dusting of a room. All these show beauty of line and design as well as fascination of subject and perfection in coloring.

An early and prolific source of subjects for the Nipponese artists was the playhouse, which became immensely popular with the people in the middle of the eighteenth century, when there were almost as many public idols as there are in the movies today. The players not only set fashions, but their influence was felt everywhere, and no less in art circles. Portrait prints of the favorites were to be found everywhere, and in the "Ukiyo-e" school of prints, theatrical themes predominate.

In the beginning "kabuki" was merely a series of dramatic dances with troupes of women as the chief performers. Then young men took up the stage and later older men entered the profession, and there became more acting until the kabuki developed into a dramatic performance.

This gave a decided impetus to the making of these prints, and the so-called Ukiyo-e School—ukiyo-eshi or makers of pictures of this fleeting world, as they were called—found ample material.

Quincy

Concluded from page 3

The house was built in 1635, at least the main structure, by William Coddington, and here his radical friends were accustomed to meet before their banishment. Then Edmund Quincy, who came to Boston with John Cotton in 1633, obtained possession, and at his death it descended to another Edmund, father of Dorothy Q., "a lady born," and the ancestor of Oliver Wendell Holmes.

It was in this house that John Hancock wooed and won another Dorothy Q., daughter of a fourth Edmund. Dorothy was the belle of Boston and was greatly admired by Lafayette. With her four sisters, almost equally as beautiful and well liked, the place became the gayest in the countryside.

In that same chamber, scratched on one of the window panes with a diamond, is the signature of John Hancock, and a joking verse addressed to an older sister of his sweetheart, between whom and the youthful lover there was always a spirit of raillery.

To make the charm complete, the house has its secret chamber. The windows of one of the sleeping rooms extend upward to give it light, so that from the outside of the house there is no suggestion of its presence. A shaft for food, one foot square, goes down to the kitchen beside the chimney, and a secret stairway leads to the cellar, from which an underground passage went to Furnace Brook, just back of the house. In a flat-bottomed boat it would take but a few moments to reach a vessel in the harbor. What was the purpose of these elaborate plans for concealment? Smuggling? Or perhaps it was a place of refuge, if needs be, for the regicides, at least one of whom was known to live in Quincy, dwelling in great obscurity in a stone pit, but honored at his death by the presence of the governor and other men of note at his funeral.

Those days of Quincy's picturesque adventures have passed and every decade sees some inroads on her memorials. Even historic Massachusetts Fields, where Myles Standish sought the Sachem of the Massachusetts Indians at his council fire, becomes, in the hands of a real estate company, Norfolk Downs. But one thing they cannot change, the solid granite that underlies the city and its environs. "Daunting terrible" it appeared to the colonists, and it still thrusts its long ribs through the shallow soil, apparently undiminished by years of ceaseless quarrying.

At first only the surface boulders were used for building. These are of a dull reddish brown, like King's Chapel in Boston, the blocks for which were fashioned by dropping balls of iron upon the heated stone. Then the town became alarmed lest its supply fail and ordered that no more be transported beyond its limits, although enough was granted to build the Hancock mansion on Beacon Hill. It was not until 1803 that iron wedges were used to split the stone, thus breaking the crust of the hills and making available their treasure.

But a desire to erect a monument to commemorate the Battle of Bunker Hill was father of a still greater innovation, the building of the first railway in the United States. Fittingly enough, this project was completed under the younger Adams, and is the most notable event of his administration. The quarry purchased for the purpose was four miles inland and Gridley Bryant of Scituate conceived the idea of building a railroad to transport the stone to tidewater. At that time, the winter of 1825-6, the Manchester to Liverpool railroad was only a visionary project.

At last, with discouraging restrictions, a charter was granted, and the first of April, 1826, work was begun. The seventh of the next October the first train of cars passed over the whole stretch of road. The rails, which were of iron an inch thick and three inches wide, were supported by stone blocks like curbings, laid longitudinally instead of crosswise, like the sleepers of our modern railroads, and all the iron work, the frogs and pulley wheels, were hand wrought.

From the very first the enterprise was a success. The road was in constant use for forty years and then sold to the Old Colony Railroad Company. Some of the original structure still remains, and, in 1926, at the celebration of the one hundredth anniversary of the railroad in the United States, it will doubtless be fitted up much as when it aroused the half-credulous admiration of the whole country.

Un-American King Coal—Fifty Years Behind

Lack of Intelligent Selling on Part of Soft-coal Operators Responsible for Belief People Hold That Anthracite Is More Satisfactory

By BURT P. GARNETT

THE fact that a coal famine can occur in the United States should be looked upon as a national humiliation and an astonishing thing. However, the majority of us see nothing extraordinary in the almost regularly recurring shutdown of industrial plants and widespread individual suffering. We are dismayed and puzzled, but we accept a coal shortage as we accept a tornado, a killing frost or any other natural disaster.

A similar interference with the supply of almost any other essential commodity would arouse high indignation and amazement.

Can the reader, by letting his imagination have the freest play, envisage a shortage of sand and gravel? Think what such a shortage might mean—a tie-up of practically all new building construction, paving, subway, tunnel and bridge-building operations, resulting in suffering scarcely less serious than that of a coal famine.

Offhand, one probably would guess that there is so much more sand and gravel available for use in the crust of the earth that a comparison with the coal situation is absurd. The supply is, of course, practically inexhaustible. Nevertheless, the rather startling fact is that the area of workable coal lands is perhaps greater than the workable deposits of sand and gravel, suitable for concrete construction.

Coal Industry Fifty Years Behind

WEST VIRGINIA, for instance, has much more coal than sand and gravel. Such material, for use in building roads and for other purposes, is shipped from Tennessee and Alabama to Florida, a railroad haul of more than 400 miles. The reason for this is that Florida has little gravel, and beach sand is not suited to the making of concrete.

A recent survey of twenty-two states indicates that the comparison between coal and sand and gravel is rather apt.

Who can recall a sand and gravel shortage of national consequence? Why, then, if the resources of coal are as great, perhaps greater, than the deposits of sand and gravel, does America have, frequently, serious coal shortages and never sand and gravel shortages?

The answer is that the sand and gravel industry in America is on a par with other modern American industries. The coal industry is fifty years behind the times.

Fundamentally, the two industries are alike. In both cases a material is dug out of the ground, loaded into vehicles and hauled to the point of consumption. Insofar as price is concerned, coal has a much greater value than sand and gravel. Why is it, then, that you observe in most American cities coal hauled in slow-moving, horse-drawn wagons, whereas sand and gravel are hauled in big, efficient motor trucks—costing from three to five or six times as much as horses and wagons?

Why should the methods of 1923 apply to the movement of the cheaper material while the methods of 1873 survive in the handling of coal?

Even the most cursory study of the business of mining and distributing coal should cause Americans—more familiar with machines and machine methods of doing things than any people in the world—to raise their eyebrows in inquiry. It is surprising and somewhat disconcerting to those of us who are proud of American achievements to find that one of our greatest industries appears to be fifty years behind the times.

Just Taken for Granted

LET sand and gravel be handled as it was fifty years ago and skyscrapers would not arise so magically in America. Let eggs, or oil, or meats, or grain, be handled as they were fifty years ago and America would be in a continual state of distress.

Why is it that the American people take coal shortages for granted?

The average person has little interest in coal other than as a substance which provides heat for his household. If a coal shortage shuts down a factory and throws him out of a job he is, of course, exceedingly interested, but the number of people who suffer in this way is much smaller than the number of those who are concerned with the matter of domestic heating.

The "Annual Anxiety" over next winter's coal supply has become a chronic ailment. It began early in the summer, this year, with a price of $13.50 a ton, in New York, for domestic coal. This was accompanied by rumors of a strike and reminders that the patched-up agreement between the coal operators and the union miners will terminate in the autumn.

On behalf of the consumer, President Harding and Congress called in a set of consulting physicians known officially as the United States Coal Commission. Just at present, these gentlemen are in vacation, but they will meet in the autumn, just in time for the strike, if there is a strike.

In the meanwhile a considerable corps of experts, anesthetists, and operating-room assistants are sharpening knives, polishing microscopes and "gathering data."

There is some ominous talk of an operation—government operation, to be specific. The householder isn't sure whether he likes the idea or not. The mine owners and operators are quite sure they do not like it; so are the unions and a considerable number of brokers, retail dealers, bankers and railroad officials.

The idea of government operation—or ownership—does not appeal to the Administration. The Republican party does not go in for such. John Hays Hammond, chairman of the coal commission, in June sent a letter to the participants in the preliminary negotiations for a new wage agreement in the anthracite coal field advising them that "public sentiment will not tolerate a suspension of anthracite mining this year."

It is a well-known fact among medical men that even the threat of an operation has a curative affect—temporarily, at least.

Such measures of "suggestive therapeutics" may give relief from the malady for a season. It is more than likely that there will be no strike and that this year will see a record-breaking production. The last disastrous coal shortage was a bit too much for the public to let pass. The operators and the unions even frightened themselves. On the other hand, the squabble between the unions and the operators may become a very bitter affair. The leaders of the organized workers in the anthracite field are not wholly under the control of the officials of the United Mine Workers of America and are looked upon by many as uncompromisingly radical.

In either case—whether there is a strike or whether there is not—there is no prospect of any movement which will prevent coal shortages in the future.

There were three major and two contributing causes of the last coal shortage, as follows:

1. The strike throughout the anthracite field and in about half of the bituminous fields.
2. The railroad shopmen's strike.
3. A desire on the part of the anthracite operators to restrict production and so be enabled to profit by increased prices.
4. Lack of modern storage and handling facilities.
5. Ignorance, stubbornness and extravagant habits on the part of the consumers.

The first three have not so much to do with the future as the last two.

Public Responsible, Too

IN SOMEWHAT parrot-like fashion Americans have taken up and repeated the assertion that "capital and labor have no right to make the public suffer through their disagreements." Consequently "the public" may be rather surprised and chagrined to know that it—or they—are as much responsible for coal shortages as the mine operators and the unions. They are less to blame, since they were unaware of the conditions. Perhaps they were kept in ignorance of the facts. At any rate, they were—and are—ignorant.

It is easy enough to understand how a mine strike restricts production. It also is easy to understand how a strike of railroad shopmen disables rolling stock and seriously hampers the transportation of coal.

It may not be so easy to understand why, if there is so much coal that it can be classed with sand and gravel, there should not be sufficient competition to prevent any scheme for the restriction of output on the part of the mine-owners and operators. Just here is where the responsibility of the public becomes somewhat clear.

In the first place, anthracite coal is a luxury. With a limited supply, the operators of anthracite mines want to conserve what they have and sell it at high prices.

A coal shortage in the East—the Middle Atlantic States—means, actually, an anthracite coal shortage. The householder in this section of the country has become so used to anthracite that the term "coal" means to him anthracite—hard coal. He looks upon bituminous coal as that "awful stuff" he is obliged to use when there is no anthracite to be had.

A recent inquiry among consumers shows that an amazing number in these states have the idea that bituminous coal is some sort of inferior by-product from the anthracite mines. This mistaken idea costs him a great deal of money and decidedly complicates the national fuel problem. It explains why the coal shortages of the last few years have aroused so much indignation but so little understanding.

Pennsylvania Holds Anthracite

NATURE has bestowed upon a small, favored section of the state of Pennsylvania practically all of the anthracite coal there is on the American continent. There are small fields in Colorado and New Mexico, remote from the great consuming areas and containing negligible quantities. The United States Bureau of Mines estimates that between fifteen and twenty billion tons remain in the Pennsylvania fields. At the present rate of consumption, about 80,000,000 tons a year, there is a sufficient supply for 150 to 200 years.

Those figures, while correct, are somewhat misleading. The mining of anthracite coal has increased greatly in difficulty in the last ten years or so. If cost of production were entirely disregarded, billions of tons could be mined. Practical engineers, however, thoroughly familiar with the situation, assert that in twenty-five years it may become impractical to use anthracite coal. The mines are very deep, the pumping of water, hoisting and a thousand technical difficulties present problems that are continually adding to the cost of anthracite production.

While it was easy to produce, the price was reasonable and the fact that it is a "clean" coal caused the widespread use of anthracite and the formation of a habit which, like all habits, is hard to break.

In contrast with anthracite, let us look at the Bureau of Mines figures concerning bituminous coal. About 200 times as much is available in the United States. Of the total coal production, about one-sixth is anthracite. About one-fifth of the coal used for heating human habitations is anthracite. This means that the American people use only five times as much bituminous coal out of a supply that is 200 times as great as anthracite.

Moreover, considered chemically, bituminous is high-grade coal and anthracite is low-grade coal. All coal, according to the geologists, started as organic matter—great piles of fallen trees and other vegetation. Centuries of sunshine and various periods of disturbances on the crust of the earth gradually changed this matter into peat, semi-bituminous and finally bituminous coal.

Bituminous Near Surface

BITUMINOUS lies in great, even, rock-like structures, near the surface. Anthracite coal lies buried deep in the earth, in mountainous regions. As a matter of fact, anthracite coal was, at one stage of its development, bituminous coal. During the period when the crust of the earth was going through a series of appalling disturbances and distortions, volcanic eruptions, the movements of glaciers and such performances, certain deposits of bituminous coal were caught in the jam.

Earthquakes, landslides and the throwing up of mountains, caught such deposits of coal. The tremendous friction which was developed caused the coal to ignite and burn. A part of the volatile matter was distilled off. Finally the earth came to rest and cooled off, and in the twisted, gnarled seams between the rocks, hard, anthracite coal remained.

As proof that this is so, the mineralogist presents the evidence that he can make anthracite coal out of bituminous, but cannot make bituminous out of anthracite.

Bituminous contains about twenty per cent of volatile matter—that is, material which ignites and burns rapidly, with the escape of gas and a considerable quantity of smoke. Anthracite contains only about eight per cent of such matter. Hence, bituminous contains much greater heat-developing possibilities than anthracite.

The eastern one-third of the United States hasn't learned how to use bituminous coal properly, and therefore wails loudly when it has to use it at all.

It perhaps should be explained that there are many grades of bituminous coal—all the way up from "sub-bituminous," which is soft and dusty and not at all agreeable for a householder to handle, to "semi-anthracite" which is hard and clean.

In the case of the so-called "smokeless" coals, any good fuel engineer will explain a simple, satisfactory method of firing a household furnace to give as good satisfaction, with less ash and cinders and at considerably less cost than if anthracite is used. This method is to put coal on one side of the fire, so that, when the gases arise as the fresh coal ignites, there will be a flame to burn off these gases.

East Must Face Situation

IN THE WEST, where the futility of using anthracite coal is generally recognized, because of the long railroad haul, bituminous coals are used without difficulty or complaint. The East will have to come to the same sort of arrangement eventually.

A process has been invented for treating bituminous coal to run off about half of the volatile matter as gas. Not only can gas be run off, but benzol and other oils, ammonia, coal tar pitch and coke may be produced from bituminous coal (as is being done now in great industries, for example, the Ford plant at River Rouge). However, the commercial coal dealer doesn't care to go into the refining business, but such refinement of coal in a by-product coke-oven plant, operated in conjunction with a steel mill or other metallurgical industry, can be and is highly profitable.

If these things are possible and practicable, why is it that the coal industry has not taken advantage of them? Why have not the bituminous mine operators conducted educational campaigns, by advertising and otherwise, to acquaint the public with the use of such substitutes?

The only answer that seems justifiable is a rather brutal one, perhaps, but it is, to wit: There isn't enough intelligence in the bituminous coal industry as it is now constituted.

The whole trouble, insofar as the men actually engaged in mining and distributing coal are concerned, is lack of intelligence. If the industry were on a par with the oil-refining industry, the automobile industry, the steel industry, the meat-packing industry or with agriculture, coal shortages in this country would disappear.

Most of the retail coal merchants in this country began as teamsters. Hauling coal was one of their jobs. They became acquainted with the details of the business—which did not greatly tax their mental capacity—and struck out for themselves. The leasing of a railway trestle, the solicitation of orders, the hiring

The Charms of the Nova Scotia Peninsula

Halifax, Founded to Protect Massachusetts, Remains Today Like Bit of England

By JOHN T. FARIS, D. D.

This is the last of four articles by Dr. Faris.

Spreading codfish out to dry.

TRAVELERS from the United States should have a special interest in Halifax, the capital of Canada's province of Nova Scotia, because it was founded in response to the earnest plea, made by Massachusetts Colony, that their safety depended on the fortification of the Bay of Chebucto. Accordingly, in 1749, emigrants were sent out from England, Halifax was founded, and the first steps were taken to build the stronghold that has been called "the Cronstadt of America." About the frowning citadel slowly grew an English city. The citadel is still a fortification, yet its might is now a memory, for other strategic points near by have supplanted it until Halifax has become the most important military and naval station in Canada. But the city is still like a bit of old England, with its modest residences, its bits of green, its public monuments, and its retiring business houses.

The height where the Dominion garrison finds quarters affords an impressive view of the town, as well as of the generous harbor where ships seek shelter not only in winter, when Halifax is the favorite port of Canada, but in summer when both islands and shores are bowered in green. It would be difficult to find a nobler view with effort so small. The climb to the citadel drumlin is easy—for it is but ten minutes' walk from the hotel by streets whose terraces are reminders of the grades of San Francisco. The small extension of the bay called the Northwest Arm and the ample Bedford Basin stretch away into the dim distance. The Arm is a popular resort for all who sail or row, but friends of the Basin are divided in their opinion whether it is better to glide over its bosom or to take the twenty-five mile drive around its shore line. This ride includes a glimpse of the lake on the way to Dartmouth, opposite Halifax, the city where the ship explosion of 1915 brought overwhelming disaster.

The damage thus caused was repaired long ago, but all over both cities are reminders of the day of death. Visitors to quaint St. Paul's church find one of them in the vestibule—a missile driven through the wall and fastened firmly above the inner door of the vestibule, where it has been retained as not the least interesting among the tablets and monuments that distinguish this dignified frame church, which was built in 1750, and so is the oldest structure in the city.

The church is but one of scores of attractions that are peculiar to Halifax. There is the unforgettable clock in the squat but pleasing tower at a point where the grounds of the citadel approach the city below—a landmark revered not merely because it was built by the Duke of Kent, the father of Queen Victoria, but because it is now used as a government signal station. There is the rather austere Sebastopol monument, telling of the days of the Crimean War, which guards the entrance to interesting old St. Paul's churchyard, close to the business center of the city. There is the public garden, a little gem in a fit setting, close to the citadel; Point Pleasant Park, on the Northwest Arm, with its curious Martello tower, another relic of early fortification days; and Chain Rock, in which was fastened one end of the cable stretched in early days across the Arm as a protection from threatening French men-of-war. Add to the list the residence—now a hotel—built in 1759 by a member of the governor's council, who brought the stones from Louisburg, dismantled in time to make way for Halifax as a fortress; the Provincial Parliament building, with its memorials of heroic days; the odd Prince's Lodge, on the shore of Bedford Basin, another reminder of the builder-governor, the Duke of Kent; Government House, the residence of the Lieutenant Governor, which has the graceful dignity of an English country seat of long ago.

On the way to the Grand Pre country.

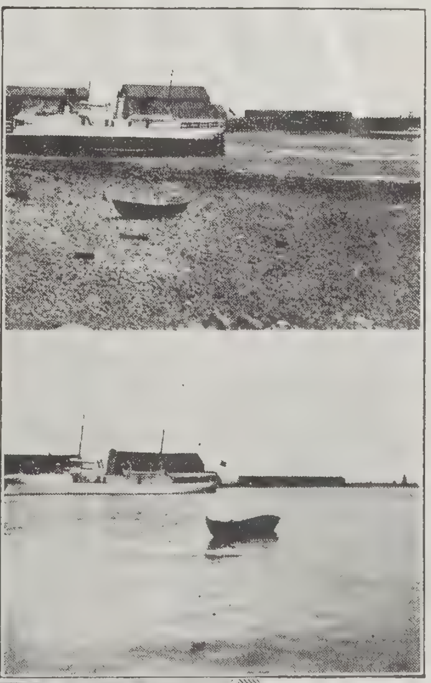
The Haligonians know how to appreciate their surroundings, and they are eager that visitors should see with their eyes. "You should see the sun over the harbor channel," an official at the Union Station said earnestly to a waiting traveler. (The pride of possession was so evident in his words that the traveler wondered why he did not say "our sun!") "We have some remarkable sunsets," he continued. "It is good to see the red glow falling on the green of the island over there, on the white lighthouse, on the sands, on the fishing boats as they come in from the day's toil, on the steamers that pass up to our million-dollar pier through our forty-five foot channel that needs no dredging. This is the sight the incoming thousands from abroad will see when their boats moor at this great immigration station, one feature of the noble group of buildings of which the new railroad terminal is to be a part. There will be room for many of them, for nine of the largest ocean vessels will be able to dock there at one time.

"And when the immigrants proceed on their journey they will see other marvels. Some of them will go from the city by the deep rock cut that leads toward the waters of the Northwest Arm, out Dalhousie College way. Or they will go along Bedford Basin, the extension of the harbor channel to Bedford, the summer resort from a portion of which Halifax may be seen, though around the first bend of the Basin the verdure-clad hills, the sinuous shore, and the winsome islets make the city seem far away."

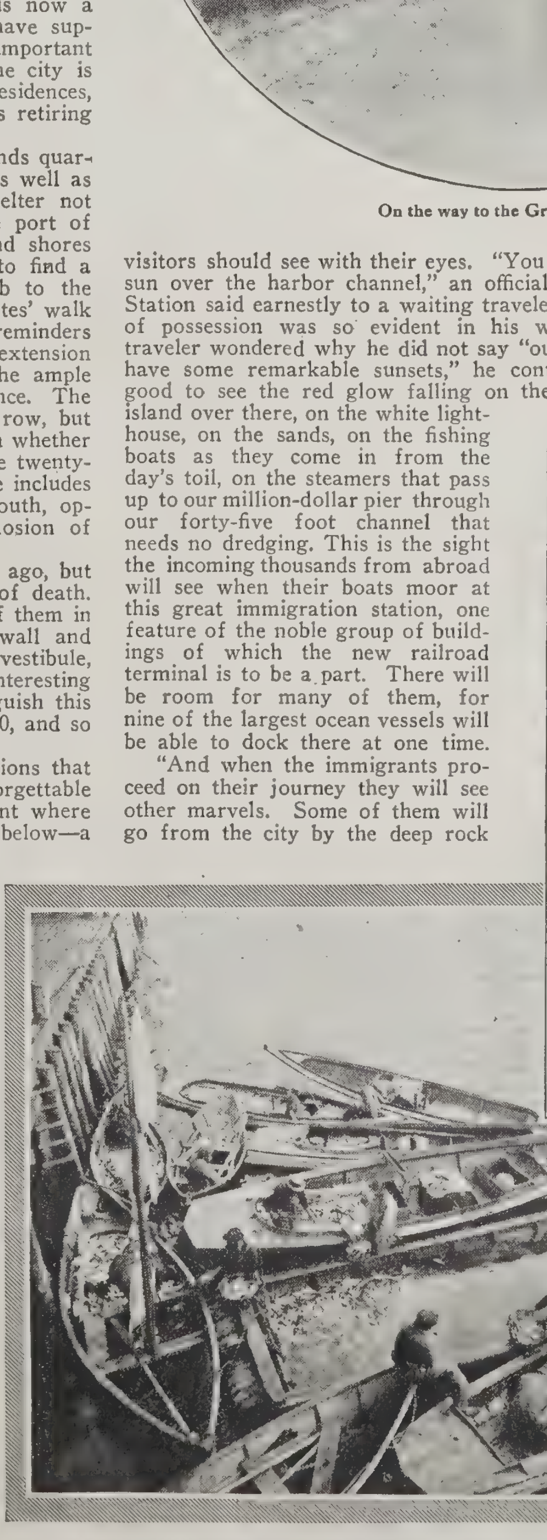
When Halifax has been left behind it will soon be apparent that Nova Scotia is a land of contrasts. On the southern shore the tide rises but a modest eight feet; across the peninsula thirty or forty feet is a reasonable height. In the southern section the country is wild and covered with forests. Bold rocks and haphazard lakes are everywhere. But toward the Bay of Fundy, along Northumberland Strait, and reaching down toward Halifax, are some of the most beautifully fertile lands on the continent. So no traveler need fear that he will be bored in Nova Scotia; the country has variety enough for a province many times the size.

The traveler is never more than about thirty miles from the seacoast, and wherever he goes, whether by rail, or foot, or by automobile, he will find it so easy to give a sigh of deep satisfaction. Here is a glimpse of blue mountains, not too ambitious in their efforts to climb skyward; there are peeps into beautiful valleys, or restful studies of hills whose bewildering curves could not be described even by a mathematician; yonder is an unexpected lake, a distant look at the open ocean, a study of the waters that pour with abandon into the trough-like Bay of Fundy, or a vista across the peaceful stretch of the Strait of Canso, that convenient canal of Nature's own making.

Where the entire countryside is so full of charm, it is not easy for the traveler from Halifax to decide in which direction to go. But if he follows the advice of the official at the Union Station he will go toward Yarmouth. "You must see our South Shore," he pleaded, his face glowing with the memory of that two-hundred-mile stretch of bays and promontories, of ragged inlets and bold, bare rocks. "Once make that journey, and you won't be able to forget it. I can see the brilliant coloring now—the blue of the water and the sky, the white foam of the pounding breakers, the dull brown of the rocks that meet the onset with a determination to stay the progress of the waves; the green of trees and grass, the gold and red and purple of the wild flowers that find lodging places everywhere. Whatever you do, don't miss our South Shore."



Tides.



Deep-sea fishermen unloading and selling their catch at Lockport. Herring by the basket, ton or bushel.

Unspoiled summer resorts, picturesque fishing villages, inviting yachting waters, sloping sandy beaches—all the joys of a wealthy seacoast country—come with bewildering rapidity. Tales of pirates, of privateers, of early French settlements, and of their Scotch successors, enliven the way. It is easy to credit the stories of game back in the woods that are thick in many places, and when there is a meeting with a fisherman who has been to the clustering lakes back of Liverpool—the town that boasts a history of more than three hundred years—there will result an irresistible longing to go and see what lies back toward the height of land, the watershed between the Atlantic and the Bay of Fundy.

The terminus of the South Shore trip is Yarmouth, the interesting old town that welcomes the shipping of the twentieth cen-

Uncle Sam's Duty Toward His 'Ugly Duckling'

Judge, Jury and Executioner, President Harding's Role

By BURT M. M'CONNELL

PRESIDENT HARDING went to Alaska early in July as judge, jury and executioner. For Alaska, Uncle Sam's "ugly duckling," was—and still is—on trial for its very life. Mr. Harding returned to Seattle three weeks later as Alaska's guide, philosopher and friend. And heaven knows our northern Territory, an empire in the making, will need every friend it can muster in the next few months, for in December or January the country will be tried before another jury—the Congress of the United States. And Congress is five thousand miles from Alaska. Moreover, with the exception of a mere handful of members of both the Upper and Lower House, Congress has scant understanding of Alaska's problems, little if any desire to understand them, and no sympathy at all with the Territory's longing for self-government.

Strangely enough—and this is the tragic part of it all—Alaska has done nothing for which she should stand trial. Nevertheless, she is crushed by the dead hand of bureaucracy, her destiny controlled by thirty-five departments and bureaus of the Federal Government, the heads of which have little if any first-hand knowledge of conditions in the Territory and unlimited opportunity to create manifold restrictions and thus hold the power of life and death over Alaska, her industries and natural resources. These thirty-five departments and bureaus are charged with more than a hundred kinds of public business in the Territory. The bureau officials are approximately five thousand miles distant from the sparsely settled country, one-fifth as big as the United States, which they are supposed to administer.

The problems of Alaska, a pioneer country, are not those of a settled community. They are the same problems that faced the settlers of the Great West, and they will have to be settled in the same way—by inducing homesteaders and business men to settle in the Territory of Alaska, as they settled in the territories of Minnesota and Washington. But neither capital nor labor will look with friendly eyes on an unknown wilderness, however encouraging the prospects, until they are assured of a "square deal" from the powers-that-be. And up to the present that assurance has not been forthcoming.

Governor Without Power

THE Governor of Alaska is absolutely without power; he can only recommend that certain steps be taken. The Delegate to Congress from Alaska has no vote; he can only hope and pray. Presidents of the United States, Senators and Congressmen, Democratic and Republican, for years have endeavored to bring order out of the chaos that exists with regard to Alaskan affairs. President Taft's commission, appointed more than ten years ago to seek out the weaknesses in each department administering affairs of the Territory, performed its duty, and rendered a report, but the complicated, conflicting, interlocking bureaus continue to function as of old. The cumbersome departmental machinery, with long-distance representatives in Alaska for the forests, the fisheries, the railroad, the trails, the cables, the public lands, the mail service and almost a hundred other kinds of public business, with each bureau head intent upon his particular business, jealous of his own success and prerogatives, and all more or less unrelated and independent of each other, naturally leads to the utmost confusion and inefficiency. There is no central authority, nor can any power located in Washington ever coordinate the functions of all these bureaus. Each is a law unto itself. The bureau heads are not keenly interested in Alaska, its welfare, its problems, its advancement, or its aspirations. Lack of co-ordination, general inefficiency, haphazard and restrictive rulings and duplication of effort are the natural result. Before the installation of the Budget System the Government of the United States was looked upon as the world's worst managed business. And while the budget is said to have helped matters, the long-distance administration of Alaska remains the most inefficient feature of that business.

Alaska—and this statement will come as a surprise to ninety-nine out of every hundred readers of this article—is the greatest per capita contributor to the national revenues. As an investment, the Territory, which cost the United States a paltry $7,200,000, pays several hundred per cent a year on its original cost. Which is another fact not generally known. Furthermore, the governor told me two years ago that if the taxes collected in the United States from the people, the industries and resources equaled per capita similar collections from Alaska, the yearly national revenues would exceed twenty billions of dollars—roughly five times as much as the Treasury receives at present. Yet this potential empire is daily being discriminated against, neglected, and misgoverned; this Territory, rich beyond belief in natural resources, is virtually on trial for its economic life.

Alaska already has produced more than $1,000,000,000 in wealth. The United States Treasury receives from the Territory in direct taxes, corporation taxes, and other revenues, an annual amount which is far over and above all sums appropriated by Congress for the Territory. But the Territory itself, which produces these revenues, is compelled to accept whatever amount is doled out from Washington. Although her fisheries, roughly valued at $50,000,000 a year, are becoming depleted, she is not permitted to use any of this money to build them up. She is not allowed to spend her revenues for the building and upkeep of roads and trails, or for the construction of lighthouses, schools, hospitals for the natives, suppression of the liquor traffic, or new government buildings. One result of this is that the governor's office is a wooden shack that was once an Indian school. Government offices are scattered about the city of Juneau, in rented quarters, instead of being grouped together for convenience and economy in a government building.

Senators and Representatives of established states cannot reasonably be expected to devote the same amount of time and thought to Alaska's problems that they devote to their constituents. Besides, they have the affairs of the nation as a whole to consider. The World Court, the problem of taxation, the coal problem, relief for the farmer, and other matters of wide import continually are preventing them from taking an interest in the "iceberg" which Alaska is supposed to be. They—and most readers of this article—will be surprised tc know that wheat grown in Alaska has taken first prize at Minneapolis. The legislators at Washington have neither the time nor the inclination to study conditions in the Territory, nor should they be asked to do so; Alaska should have Senators and Representatives of her own at Washington. The southeastern section of the Territory, or the region south of the Yukon and east of the government railroad, should be made a state—the State of Alaska. And if Congress refuses or neglects to do this at its next session, the President should make it a state by proclamation.

Alaska needs home rule as badly as Ireland did, and the way to make Alaskans worthy of self-government is to give them self-government. "Government of Alaska, by and for Alaskans," should be the slogan of the residents of the Territory, for "taxation without representation," such as is now virtually the case with regard to our northern country, has no place in our economy. No people are so well qualified to govern a country as those who live in it. That fact was established when the United States fought for its independence. Not only have the people of the Territory a right to self-government, but they are better qualified than any outsider could possibly be to give Alaska good government. It is absurd to doubt that the great wealth of coal, timber, fisheries and oil in that land is sufficient to bear the cost of state government.

When Alaskans begin their fight to overcome governmental stupidity and the vast national indifference which seems bent on forgetting the very existence of the Territory, they will be told by opponents of self-government that the Panhandle section, a strip roughly 500 miles long and from forty to 150 miles wide, could not support itself through its revenues. Yet this section, with its fisheries and timber, gold mines and oil wells, is the richest part of Alaska. Besides, there is the record of Federal taxes which shows that this section furnished more than half the taxes collected in the whole Territory. The proponents of Statehood will also be told that the population of Alaska does not warrant such an honor. The population of the Panhandle section is not known, but the entire Territory, of which this is the most densely populated section, claims a population of 30,000 whites. And territories with less population than this were created states during the past century, among which might be mentioned Colorado, Illinois, Indiana and Michigan. The argument also will be advanced that Alaska will not attract settlers because it is too far away. But Alaska, when present means of transportation are considered, is no farther from New York City, for instance, than St. Louis was a hundred years ago. The advocate of home rule in Alaska will also be reminded that ninety-eight per cent of the Territory belongs to the government. True enough, but that was once true of all the land that lay between the Alleghanies and the Mississippi, and later of the land that lay beyond. Friends of Alaska will be assured by the opponents of self-government that Alaskan homesteads are unfit for agriculture, but that was also the contention at one time against the western prairies. The objection will also be made that Alaska is not contiguous to the United States, and therefore should not be made a state. This has little validity, since neither were California nor Oregon when they were admitted, although the territory between them and the sovereign states was American. Moreover, Alaska is much more accessible than were California and Oregon when they were admitted.

Statehood Is Needed

NO ONE denies that Alaska is perfectly capable of self-government, or that her admission into the Union would relieve automatically much of the dissension and unrest caused by misgovernment from Washington bureaus and the fact that the Delegate to Congress does not have a vote. Statehood would insure Alaska a vote in Federal legislation affecting its fisheries, timber, and other resources. Heretofore the Territory had been in the position of the bone in a dog fight. Her people are justified in saying, with Artemus Ward, that they "are governed 2 mutch." Had the government pursued the same policy—or lack of one—toward the country west of the Mississippi that has halted Alaska's growth for the past ten years, the prosperous states that now go to make up our Great West would still be much of a wilderness.

But this was not done. Early in the history of this country the government applied to her territories the principle upon which it was founded—self-government. Later the territorial form of government was improved, broadened, until about seventy years ago territories had essentially every power that a state government enjoyed, except the power of participation in national affairs; they could not vote in the Senate and House of Representatives. The present Organic Act in Alaska is much restricted in comparison with the general territorial government policy, despite the fact that the people of Alaska, no matter what their political complexion, have for the past twenty years asked Congress for a full form of territorial government. A less hardy and courageous people would have become discouraged; a less patriotic people might have tried to secede; a less sensible people would have kicked over the traces.

The present government of Alaska is little better than that against which the American colonies rebelled in 1776. It is a mockery of democracy; a government by absentee bureau heads which even the Roman emperors of old did not practice, for they sent pre-consuls to their distant provinces to govern them. These bureaus not only control the administration of the Territory, but advise Congress as to the proper legislation for a country as large as the original Louisiana Purchase, with problems peculiar to itself. Whereas a state has a government "of the people, by the people, and for the people," Alaska has a government of the people, by the bureaus, for the bureaus. The most valuable of any of our territories, our "Northern Wonderland," receives the least consideration from the government. No one would think of administering the Philippines in this high-handed manner, nor would Great Britain adopt such an oppressive attitude toward Canada or Australia. For no federal government is wise enough to tell the residents of any territory or colony how to administer their local affairs. Particularly is this true of Alaska, peopled as it is with Americans of a pioneer spirit.

An Obsolete Form

THE right of self-government is an American right that has been denied the people of Alaska, who for years have muddled along under a limited territorial form of government. Under this obsolete form the people do not govern themselves, as in a state; they are governed by someone else. The people of Alaska do not make their own laws and change them when they see fit; they do not elect their governor, levy their own taxes, and spend them as they desire; all this is done for them by their guardians at Washington. This paternalistic form of government was not successful in the Old West, nor is it satisfactory in Alaska.

How different conditions are in the Philippines! Here the people have practically all the powers of a state, the power to levy tariff taxes, the power to administer and dispose of public lands for the benefit, not of the United States Treasury, but of the Filipinos themselves. The same power is given to Porto Rican and Hawaiian governments, all three legislatures being authorized to enact such legislation for the disposal of the public lands as they might see fit, provided that such acts should first be approved by the President of the United States. Furthermore, internal revenue and income taxes are paid by Porto Ricans and Filipinos into the Territorial Treasury. Would it be asking too much of Congress to confer the same privileges upon Alaskans that have been conferred upon Porto Ricans and Filipinos? Cannot the Alaska legislature be trusted to control and administer the public lands for the benefit of Alaskan citizens? Giving them this power would be nothing short of justice to the inhabitants of the Territory, and would involve no impairment of the principles of government in this country.

Right here we come to the nub of the question which is so frequently heard: "What is the matter with Alaska?" Ten or a dozen years ago a great tumult about Alaska, raised by some uplifters, helped to wreck one of our administrations. One of our secretaries of the interior was charged with betraying Alaska to "the interests." So the Territory was tied down with endless yards of red tape, padlocked with innumerable padlocks, and over it all a sign was posted, marked "Conservation." Now, conservation of our natural resources is a good thing, and on paper this move appeared to be most excellent. But in practice it has failed. Conservation is admirable to the extent that it prevents our natural resources from being wasted or unfairly exploited, without a fair return to the government, but it has been carried too far in Alaska.

Take the forests of Alaska, for instance—34,000 square miles of them, with enough timber to supply one-third of America's present paper needs for all time. Now, true conservation calls for the utilization of full-grown trees—a "weeding-out" process—instead of letting them rot, as they are doing at present. And the reason Alaska timber is rotting, while we are importing $40,000,000 worth of pulp timber yearly, is that inducements are not sufficient to attract capital to build pulp mills. This form of natural wealth is valuable only as it is utilized, and utilization does not necessarily mean destruction, yet there seems to be a nervous dread that somebody will come along and steal it. Washington bureau heads forget that Alaska's future depends entirely upon the development of its great natural wealth.

If Alaska must be governed from Washington, say the residents of the Territory, let the agencies of the bureaus be moved to Alaska. And let Alaskans run them. But at this suggestion even Cabinet heads hold up their hands in horror. Let Alaskans run their own affairs? Preposterous! Why, that would usher in the greatest orgy of exploitation, bribery and corruption that the world has ever seen! They believe, apparently, that Washington has a monopoly on honest officeholders, and that the minute a man goes to Alaska he becomes a thief and a scoundrel. This, however, is merely the bureaucratic attitude; no bureau, department, or division of the government has ever been known

(Concluded on page 15)

Industry Demands That Gums Be Gathered

Natives of Africa and India Collect Strange Vegetable Juices

ROMANCE is now a recognized element in the channels of trade and commerce which are the arteries of civilization; so much so that manufacturers whose products run the range from rubber to optical glass are making use of it to put the human touch into their advertising. The copy writer is literally roaming the world with the chemist, but so far he has not touched on gum, the sticky substance formed by the exudation of liquids from certain trees and plants. Prosaic and uninteresting as it may seem at first thought, that product binds the past and present. It is the conundrum of commerce—unseen, yet always visible. And in all probability it has a wider variety of uses than any other known substance.

A native in far-off Kurdistan or a Moor in Senegal slashes the barks of trees that the page on which this is printed may carry a fine gloss. The smoker lights his cigar or pipe with a match in which the adhesive element is gum from the other side of the world. Milady's silks and satins are sized with gums, to say nothing of her lace curtains; her calicos are printed and dyed with it, and her finest confections make use of the refined grades. It is used in printing inks and medicines, in water colors and liqueurs, in paper and matches. The word gum to the average mind means an adhesive, such as mucilage, yet that is but one of its thousand uses.

An effort to tell the whole story of gum has been under way for fully a quarter of a century, yet it is not yet finished. In 1899 the Philadelphia Commercial Museum began the listing of all known gums. Since then so many new varieties have come to light that the museum has now made public another installment. It relates to a collection containing 374 specimens of different gums, coming from trees and plants of seventy-seven species, belonging to twenty different families. There are scores of samples of gums of which the botanical origin is unknown. The collection includes 174 specimens of gum arabic, of which 122 are from Africa, and 124 specimens of gums from India representing forty-one species, a greater variety than has been gathered from any other country.

Charles R. Toothaker, curator of the museum, has become so much of a world authority on gum in his study of the samples that every time a new gum gets into commerce he is called on to identify it and to indicate its greatest uses. In addition, gum merchants use the collection as a means of studying the commercial possibilities of soluble gums from new sources. In that connection it is not unlikely that the United States may become some day a rival of Africa and India in the production of gum from sources now rich in the commodity, but ignored.

"Gums, resins and related substances are so varied in their character and qualities," says Mr. Toothaker, "that it requires much care to classify, define and describe them accurately. The word gum is loosely used and in popular language is applied in a very general way to any substance which has certain qualities easier to recognize than describe. In this broad sense the word gum is often applied to rubber, resins, camphor and to oils which have become thick or sticky. Strictly speaking, true gum is a vegetable substance which dissolves in cold water, forming a mucilage, or else swells up and makes a thick, sticky mass. Gum copal is not a true gum in this sense, but is really a resin. Gum camphor is chemically a volatile or essential oil, and is called a gum only because it has a feel and tenacity which are understood when we say that it is gummy. Rubber is called gum because it has this same peculiar feeling when handled.

"True gums are produced by a great many different trees and plants; other trees produce substances which consist of an intimate mixture of gum and resin frequently combined with volatile oil. Gums may be conveniently classified as follows:

"Arabic group, often classed the soluble gums, which dissolve completely in cold water, forming a mucilage.

"Cherry group, often called the partly soluble gums, which swell in cold water, forming a clear, transparent jelly.

"Tragacanth group, often called the insoluble gums, which swell in cold water, forming a more or less opaque, usually white, opalescent jelly, which readily dissolves in warm water.

"Dextrine group, a manufactured gum prepared from starch. It is completely soluble in cold water.

"Seaweed group, gums extracted from various seaweeds. They form a clear, transparent jelly.

"When a plant is broken or injured so that the sap or juice runs from it and dries, a solidified substance is usually formed containing most of the ingredients of the sap or juice. But when such an injury occurs, nature promptly sets to work to heal the wound if possible, sending more sap to the damaged region, and commencing what physiologists call wound response. With equal promptness the processes of decomposition commence to act. The exposed cells of the plant substance along the edges of the wound sometimes break under the strain of the flowing sap or juice, and very often bacteria attack the weakened tissues. This is very much like what happens when a wound on a man or animal becomes infected. Scientific investigation has not been able up to this time to determine absolutely and fully what causes gummosis or the formation of gums. It is probably true that no true natural gums are formed in any other way than through the breaking down of vegetable tissue as a result of diseased or morbid conditions of one sort or another."

Photographs reproduced by permission of The Philadelphia Commercial Museum.

Gum arabic.

Exudation of gum at point of tapping. This photograph was taken at Kordofan, Sudan, Africa.

Gum arabic is a familiar trade name now applied to cover virtually all gums of a certain type from Central and North Africa, Arabia and India. Originally it was applied to gum exported to Europe from Arabia, where very little of the gum is collected today. "For several thousand years," says Mr. Toothaker, "this gum has been gathered in the part of Africa accessible to the southern end of the Red Sea, but the chief wholesale traders in olden times were along the Arabian coast, and the gum received its name because it came to Europe through them. It seems to have been carried to North Egypt from Aden as early as the seventeenth century B. C. The bulk of this gum was collected in olden times in what we now call the Sudan."

A gum garden near Taiara, Kordofan, Sudan, Africa.

The great bulk of gum arabic comes from varieties of the Acacia tree. Botanists are not agreed on their exact identity and names, but it is agreed that Acacia Verek produces the greatest quantity. It is found in the Sudan, Upper Egypt, Abyssinia, Somaliland and adjacent regions, and from it are obtained the gums known to commerce as gum arabic, Sudan gum, Kordofan gum, Khartoum gum, Turkey gum, Sennaar gum, Gedaref gum, Jeddah gum, Senari gum, Gedda gum, Turic gum and Gehzirah gum.

"The tree grows in extensive forests in the region of Kordofan," says Dr. Toothaker. "It is common in the country between the Blue Nile and the White Nile, and is found in a great area adjacent to the Sahara where there is sufficient moisture to support vegetation at all. It is distinctly and peculiarly a tree of semi-desert regions and grows naturally in a dry, sandy, barren soil. In the Sudan it is called *Hashab*, a name that is applied also to the gum. The privately owned forests where the trees are systematically tapped are called *Hashab geneina*, and the regions of wild forest are known as *Hashab wady*.

"There are immense areas in Africa where the trees grow, but gum is produced commercially only in districts not too far from wells or streams of water. Gum is collected only in the hottest and driest season of the year, and the men who gather it must carry all their food and water with them. This limits their work to only a few days' journey from the water supply. The best yield of gum is obtained when an exceptionally hot, dry season follows after one of plentiful rain. The dry season begins in September or October, and the trees may be tapped at any time after the first of November. Little is done, as a rule, till the crops of grain are harvested so that the work in the gum forests is not actively prosecuted before January or February.

"Men go out from their villages carrying a little food, a skin of water, a spear for defense against wild animals and a small hatchet with a long handle. With this hatchet the tree is cut, not too deeply, and then a strip of the outer bark an inch or two in width and as much as two or three feet long is torn away. The inner bark is not, or should not be, seriously harmed by this operation and in time and under favorable circumstances the wound heals. Scientific study shows that a species of bacteria is found in or on the bark of these trees and the gum is formed through the combined agencies of the evaporation of sap and the breaking down of the plant tissues under the action of the bacteria. The tears of gum grow to large size only after a season of good rains when the trees are full of sap and the young growth is fresh and juicy. At first the tears are soft inside and they must generally remain for a couple of weeks before they are gathered, so that the interior may become firm and hard."

Gums of the cherry group are almost as numerous as those of the foregoing, but they are not as widely used. Even in the United States, lumps as heavy as half a pound sometimes form on cherry trees and peach trees. The *tragacanth* group represents the other great commercial production. They are more widely used in mucilage. *Gum tragacanth* is obtained in Persia, parts of Asia Minor, Syria, Armenia and Kurdistan, from small thorny shrubs growing in semi-desert places.

Gum tragacanth differs also from gum arabic in that it comes in flakes. It exudes from the stub of a branch in a sort of ribbon. The process is described as follows:

"In tapping, the Kurds first burn all the leaves off the branches, then expose the roots, cut incisions in the roots, and leave for a week or so; they then return and collect the gum which exudes from the roots. The first tapping produces white gum of the best quality; second and subsequent tappings, gums of yellow colors and inferior quality. Excessive tappings weaken and may kill the bushes. The Kurds bring the gum to Suleimanaya, where it is bought by local merchants, who sell it to Bagdad merchants. These merchants export to England and other foreign countries.

"All the evidence obtainable from the few scientific men who have studied the subject shows clearly that *tragacanth* is produced by some alteration or metamorphosis of the soft juicy cells of the plant."

It is pointed out by Dr. Toothaker that *gum tragcanth* is used largely in textile printing to thicken pasty inks and give them such a consistency that the colors will not run. "Its very great virtue," he adds, "is the fact that but little gum is needed to form a very thick pasty color, which means, of course, that the color is less influenced in its shade than would be the case if a larger quantity of starch or other thickening agent were used. It is also employed for stiffening silks and crepes. It is used as a demulcent and to thicken solutions for medicinal purposes and so aid in keeping powders in suspension. In toilet preparations, it goes into certain creams and jellies. It is mixed with starch and sugar to make gum paste ornaments for fancy cakes; confectioners use it in lozenges; it goes into certain mixtures to form special pastes and cements.

Walnut Tree in Oregon Has a National Reputation

Kirk Tree at Brownsville Remarkable for Harvests

By M. NORRIS DAVIS

IN A thriving little city in Central Oregon stands the Kirk walnut tree. It is the most remarkable tree in the state, and probably the best-known nut-tree in the United States. Because of its prolific growth, tremendous size, wonderful and sustained yield and its power to transmit to its seeding all its own qualities, this tree is known to horticulturists far and wide. Men have journeyed from far parts of the world just to get a look at it and at the trees raised from its seedlings.

Naturally, this tree is the pride of its city, Brownsville, and one long street, Kirk avenue, has been named in its honor. Its entire length has been planted with walnut trees from the nut of the old Kirk stock.

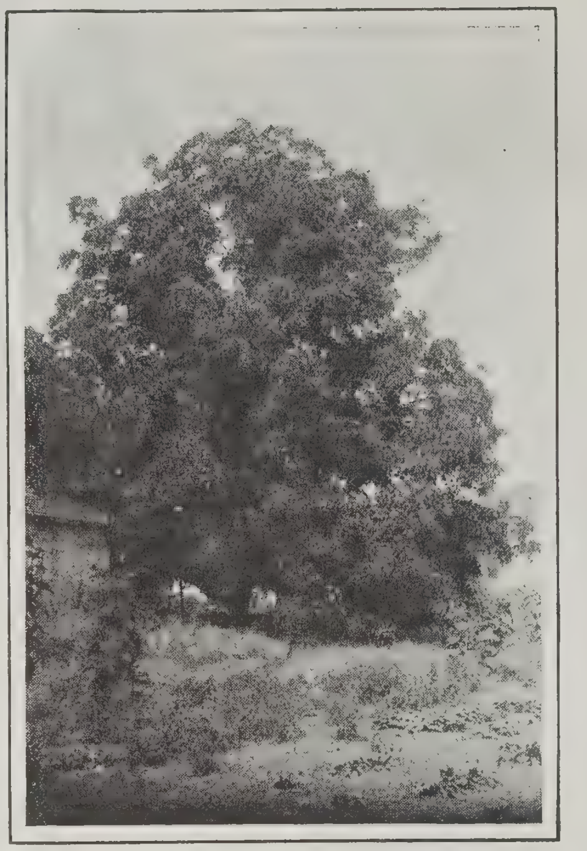
Riley Kirk was a pioneer of 1846. He was an enthusiastic orchardist, and believed in the future of fruit trees in his adopted surroundings—the Willamette Valley. He planted a large orchard east of his house, and one walnut tree west of it. Walnut raising was something about which Kirk knew absolutely nothing, so after he had planted this tree, he forgot all about it and lavished his time and labor on the orchard.

This little nut-tree simply thrived on neglect! At the present time the fruit trees have practically all been grubbed out, while the walnut tree is bearing bushels upon bushels of delicious nuts. It is estimated that the walnut tree lives to the age of nine hundred years, so there is every reason to believe that it will outlive many succeeding orchards.

Every year since its first bearing, the Kirk walnut tree has continued to give a wonderful harvest. Although Mr. Kirk died in 1900, his widow continued to harvest the crop, and tradition has it that she received more than enough to pay the taxes on her place from the sale of walnuts. The yield is much larger today.

But it is not alone for its own size and yield that this tree is famous. The books on walnut culture invariably mention the Kirk tree at Brownsville as a variety and kind of its own, and one which is practically unbeatable. The remarkable thing about this walnut is that the seedling is just as good, if not better than the original tree. Experiments have proved that in a grove planted with an equal quantity of nursery stock and the Kirk trees which were raised from seed, the former were far outrivaled. These seedlings have in almost every case grown into trees that outrivaled the largest shade tree in their vicinity, as well as producing crops so heavy that it is necessary to tie up and prop the limbs.

Throughout Oregon there has been an agitation for the planting of useful trees for shade trees, which has resulted in thousands of walnut trees being used for that purpose. On the streets of the state capital (Salem) alone, enough walnut trees are growing to make a grove of more than sixty acres. As the trees are planted about twenty-seven to the acre, it shows that more than 1,600 walnut trees are growing on Salem streets!



The Kirk walnut tree.

Nurseries have, from time to time, tried to get control of the Kirk walnut tree for grafting purposes. Brownsville people laugh at this, for they know that as good trees, if not better, can be obtained from its seed as from grafted stock.

Tests made in Brownsville in the autumn of 1922 showed that under favorable conditions the Kirk nut will sprout and in three weeks' time send up a leafed treelet two or three inches high.

Un-American King Coal—Fifty Years Behind

Concluded from page 10

of a few teamsters and the trick was done. The natural growth of the city where they happened to be in business did the rest.

The retail coal merchant seldom comes into contact with the mine operator. Between them is the broker—a middleman who contracts for the output of a mine and sells to individual coal merchants. He does not maintain yards or any physical equipment.

The cry of the union miners during their various wage disputes is that most of them work only 100 days a year. There are bituminous mines which operate the year round. Then there are operators known as "snow birds" who operate their mines during the winter and shut down during the summer.

Is there any wonder that such a haphazard way of doing things creates dissatisfaction among the mine workers?

Let us see what has happened in the rare instances where some really intelligent effort has been applied. There is one concern, operating in Washington, D. C., organized somewhat on the principle of a co-operative society. It is a corporation whose stock is held principally by consumers of coal. It owns its source of supply, a good bituminous coal mine. It has its own coal yard which is not located in the midst of a congested railroad terminal but in an easily accessible place, has built its own trestles, railroad sidings and concrete storage bins, with overhead cranes and other modern coal-handling apparatus.

This company will operate its mines the year round, and will pay the top wage. By working with its consumers, it will take care of the storage problem in this way:

The program for the present year calls for the delivery to consumers of 240,000 tons of coal. This means the handling of 20,000 tons a month. During the summer months when no coal is consumed, therefore, 80,000 tons must be stored. Through a selling and "engineering" organization, the company persuades consumers to accept spring and summer delivery of half of this amount, so that 40,000 tons are stored in household bins. The company's yard handles the other 40,000 tons.

It is a simple scheme. All of its activities are direct and there is a minimum of handling. The storage bins act as an expansion chamber to take care of emergencies such as interferences with the movement of coal from the mine or from the coal yard to the consumers' bins.

In some of the cities on the Great Lakes, retail coal merchants handle their product in a similar fashion. In most cases, however, those cities are at the mercy of the mine operators, the unions and the coal brokers.

The Washington concern's cost of coal storage is two cents a ton. It has taken the trouble to instruct consumers how to get the best results with their furnaces. It has fuel engineers who work on the more difficult fuel problems. It has screens and washing equipment to provide clean coal to the consumer.

In the mines, it has introduced modern machinery, so that the production of coal per mine worker is brought to a maximum. It has introduced the same sort of intelligent planning that many other American industries use successfully.

The same plan is being introduced in Baltimore and Philadelphia.

Considering the coal problem as a whole, it is most certainly apparent that every shortage, with its consequent disturbance of the public and legislative interference, brings the coal industry nearer to government ownership. And since the coal industry is so closely related to railroading, the transportation system may also have to go into the hands of the government. The one is utterly dependent on the other.

If such comes to pass, it will not be because of "Big Business" throttling the public. It will be, rather, because the men in the coal industry are not sufficiently big business men.

Visualizing the industry as a personality, it seems reasonable to say that His Majesty, Coal, is a great lout of a king, ignorant, autocratic and an absolute monarch; he grins foolishly at one time and scatters his substance prodigally, and again hoards it and scowls. He has so far resisted attempts at liberalization and democracy, but he is certainly un-American and his overthrow is imminent.

Charms of Nova Scotia

Concluded from page 11

tury, while it rejoices in the memory of the clipper ships that made it famous a century ago.

And Yarmouth is the starting point for those who would skirt the South Shore of the mysterious Bay of Fundy. They may take the cars of a leisurely railroad whose surveyors must have found pleasure in scenery as well as in obeying orders to find the shortest practicable route; whose operating force, from general officers to section hands, seems to take positive enjoyment in making more pleasant the path of the tourist; whose engineers have a personal pride in the iron steeds that still follow the old-fashioned custom of wearing names as well as numbers—names like Titania, Bear River, Blomidon, Glooscay, Evangeline, Charon, Gaspereau. Or they may follow the good highway—one of the system of roads on which the province has recently expended many millions—through the forests and over the low hills from whose summits there are vistas of lakes on the right and of the ocean on the left.

Almost every town gives mute invitation, and the temptation to linger becomes more difficult to resist as the way leads to villages of the descendants of Acadian exiles who found the way back to the land they loved. All along St. Marys Bay they have made their home. Across the spacious bay Long Island and Digby Neck stretch on toward Digby, where fishermen and deep-sea mariners find refuge in Annapolis Basin, among the vessels that pass to and fro through Digby Gut, the gap in the green hills which form the entrance to the Basin. The beauty of the town, perched on the hillside, has been sung by many visitors.

A vision of the sea and the mighty tides of Fundy comes when, Digby left behind, the visitor reaches Bear River, a stream that twice each day changes swiftly from a trickling stream that is lost in a sea of red mud to a mighty river where ships of good size can move in majesty, borne safely in water thirty feet deep. Bear River, the town, which clings to the hills on the side of the stream, is noted for its luxuriant cherry trees and for the water carnival for which they are made the excuse, on a July day when the Micmac Indians join with the white people in water sports.

Then Annapolis Royal, close to the site of Port Royal, where the Sier de Monts left a little colony in 1605, where was built a fortification mighty for its time, stronghold of the French, for which English and French waged war through many years. Ten times was siege laid to the fort, and three times it lowered its colors to victors. Fortunately the old fort has been preserved; it still looks down on the Basin and back to the score of miles of apple orchards for which the Annapolis Valley is famous.

Cornwallis Valley, farther along the Bay of Fundy, vies with Annapolis Valley in the claim to fruitfulness and beauty—beauty of the fields, and of the hills and the sea. The genius of husbandmen on these Acadian shores two centuries ago devised a system of dykes that made these marshes part of the Garden of Nova Scotia.

Wherever the traveler turns in this country he is confronted by sights that suggest he is in a fairyland. When he yields to the tantalizing call of the interior, he passes quaint farms where the patient oxen draw the carts as in the days of old. When he turns his steps toward the coast, he finds architecture of rocks that culminate in Cape Split, where the waters from the Bay of Fundy dash through rocks of fantastic form, on their way to the Basin of Minas. Let him cross the entrance of the Basin to Parrsboro, and he will stand in amazement at sight of large vessels resting high and dry at wharves half a mile from the water; they look as if they had been driven ashore, but they are only waiting for the return of the tide. When he follows the coast from Cape Split over Blomidon, and down to Wolfville, a town on the ridge that separates the Gaspereau and Cornwallis valleys, he finds himself in the heart of the Evangeline country. Soon he is at Grand Pré, the Great Meadow, where stood the valley of Evangeline, the Acadian whom Longfellow's genius portrayed as the representative of her people, exiled when the English displaced the French on these shores.

There may be question as to the age of the willows and the well of Evangeline. The statue and the church are frankly modern. But the meadows, the Basin and frowning Blomidon, far off across the water, are genuine relics of stirring events "on the shores of the Basin of Minas." Minas Basin narrows to Cobequid Bay, the end of the Bay of Fundy funnel, and Cobequid Bay reaches up to Salmon River, whose attraction to the Scotch-Irish settlers from New Hampshire in 1761 was so great that they laid out Truro on its banks. Sturdy and dignified as its founders, Truro is noted both for beauty and industrial progress. To prove its claim to beauty it has only to point to Victoria Park, a wondrous glen that leads far into the hills, where the spruces cover the boundary ridge, where water tumbles down in cascades, where it is difficult to believe that only three miles away it is possible to see the tides of Fundy in their might—might great enough not to need the exaggeration of Sir John Herschel who, in his "Outlines of Astronomy," declared that the Fundy tides rose 120 feet!

Not even yet are the secrets of the Bay of Tides exhausted. From Truro, along the north shore of Cobequid to Great Village, then along Minas Basin to Five Islands, there are superb vistas of water and mountain, of coves and headlands, of fertile lands and cozy houses.

At Cape Canso comes the turn that is the beginning of the last lap of the progress around Nova Scotia, the one hundred miles back to Halifax. That is, the air line distance is little more than one hundred miles. But measure the distance by the shores of all the bays and inlets! Describe it in terms of the majesty of the waters that touch the shores of the islands that are sprinkled so liberally all along the way, of the little trout streams from the hills, of the trees that grow so luxuriantly everywhere!

Americanize by Elimination and Deportation

A Common Sense Suggestion Is Made by One Who Has Come Over

By a Naturalized Citizen

HENRY H. CURRAN, the new Commissioner of Immigration at New York, had barely finished his congratulatory remarks about the excellent type of immigrants arriving at Ellis Island under the July three per centum 1923 quota when, in a subway car in another part of the city, a group of foreign laborers, apparently under the influence of illicit booze, engaged in a knife fight, leaving behind two or three wounded men and, of course, the passengers in a panic. A week later another group indulged in a similar brawl in an elevated train, all combatants escaping except one, who was identified by an injured innocent bystander. As is usual in such cases, the men under custody refuse to reveal the identity of their companions.

Thus the chronicles of the newspapers, in reporting these criminal fights, inevitably and justifiably identified the fighters in each case by their Italian nationality, which not only has the effect of steeling American readers against a further infusion of immigration but likewise enhances an anti-foreign feeling of which the victims, directly or otherwise, are the thousands of law-abiding, industrious foreigners who are taking seriously the slow process of assimilation. As one of the local Italian newspapers explained, an unlawful incident of this kind undoes the arduous and constructive Americanization campaign which is the aim of the older and well-established residents of foreign origin. The fact that resident Italians are even more emphatic than the Americans themselves in deploring this apparently ineradicable lawlessness of some of their conationals is of no avail.

Between the feuds of yesteryear and the bootlegging sniping of the present day certain sections of the metropolis may be regarded as perpetual stages where the passer-by may as well trust to luck against being peppered by bullets intended for marked individuals. The result has been that one seldom encounters a two-generation American ambling about in these exotic neighborhoods. But if it has come to the point now that the already congested city transit lines are going to be made unsafe by dangerous and quarrelsome weapon wielders, more than a rabbit's foot and a desiccated horse chestnut will be necessary to induce the average citizen to take a seat farther than a flea's jump from the nearest exit.

The point of this preamble is that while a great deal of attention is paid to the new immigrant upon arrival in this country, no attention whatsoever is devoted to him once he has been passed and is free to wend his way as he pleases.

No immigration law will ever be efficient that does not extend its authority for a reasonable period covering the time approximately required for immigrants to gravitate to what may amount as their ostensible station in life in the new world. It would not be practicable or even advisable to embody this technical surveillance in the naturalization laws, since it is not feasible to make naturalization mandatory (it would violate international treaties without adding an iota of actual benefit to the United States since a truculent "citizen" would be worse than a friendly and industrious alien) but it should be easy to control newcomers by means of the police power.

Government officials with whom I have discussed these points believe that some such system would be almost ideal, but on the other hand they fear that a step of this kind would lead to irritation abroad. This timidity is superfluous. As a matter of fact, foreign countries have established what may amount to a precedent.

How many Americans visited foreign countries immediately after the war—and in some cases even to this late day—have been obliged to fill out a blank to be filed with the police authorities of the city they visited? How many have forgotten the complicated, enervating, distracting process of obtaining a permit of residence, which had to be renewed after the expiration period? Now, there is so much difference between the American traveling abroad for pleasure or business and the immigrant bound for the United States on a quest that he alone is privileged to follow as it best suits him and his convenience, that the two individuals are not comparable at all.

Why Not Use Same Methods?

IF THE police of foreign countries are privileged to restrict and limit the freedom of visiting Americans who are not asking for more courtesy than is due a well-behaved traveler, what is there to prevent the American police from maintaining surveillance over the aliens coming to the United States? Of course, the task seems complicated, as a Senator admitted to me, but the following suggestion is made with the assurance that it will almost safeguard the United States from cumulative troubles with aliens, that it will speed Americanization by elimination, that it will be welcomed by the resident aliens and naturalized citizens who are jealous of their national reputation, and that it cannot be objected to by foreign governments as being in violation of treaties, understandings and agreements.

Residents in the United States for a period of at least ten years dating from arrival should be subject to good behavior and this privilege of residence in the United States ought to be made contractual between the American Government as party of the first part and the prospective emigrant as party of the second part.

It has been made plain by foreign governments that examination of their emigrants at points of origin will never be consented to, the objections being based upon several obvious reasons. Now, examination at the point of origin is advisable, but even if it can be ever brought about it would fail to solve the more difficult problem of what happens after the immigrant has been admitted under the law and thereafter is entitled to all the protection that the American Government affords even though he may not be morally entitled to it.

Thus it is inevitable that the emigrant's admission to the United States, even under the immigration laws, should be conditional upon his observance of certain laws and rules. There is only one simple method by which such an ideal situation can be attained.

As all emigrants' passports must be visaed by the nearest American consular official, instead of following the present method of a simple perfunctory application for same, which will be granted to the extent that the laws allow, a different application blank should be substituted. It should be an application for the visa, differing in the following details from the routine visa applications of non-immigrant travelers, which is made by the applicant subject to printed conditions to which he subscribes and accepts without qualification or mental reservation. The blank should be in two languages; obverse, in the language of the applicant, and reverse, in English. The most important condition should be that the application is made subject to good behavior and that it will be so honored if approved, and that the applicant shall be immediately deported—and so consents—to the nearest port of the country of origin upon proof that he is an undesirable or upon conviction in any competent court of any crime of willful, malicious or organized nature.

Charge It to Immigrant

LEST the objection of another official that such a plan would involve fiscal difficulties, these plans will be suggested. First, to charge the immigrant himself with the necessary deportation costs, and in most cases immigrants have more than enough for the purpose; second, that it will cost the state or Federal government much more than the ocean transportation costs to keep the convicted immigrant in jail for a period approximating a year or more; third, to charge transportation companies for the deportee's passage. Last, but not least, to assure foreign governments that might object to these stringent measures that the only alternative would be prohibition of further immigration.

What to do with the American-born foreigner who can never be but what he is will remain one of the unsolved sociological problems until the foreign districts are broken up and their inhabitants are scattered to the four points of the compass. This millennium will not take place until municipalities forbid the erection of new tenements and will order demolished or reconstructed all buildings housing more than so many inmates for given cubic air space. There is bound to be lawlessness and crime when our supposedly modern cities—for foreign cities do not permit such a spectacle—countenance the occupancy of a single room by sixteen persons in two daily shifts.

But as it is evident that one cannot become an American by the simple expedient of naturalization if intent lacks, despite the warning against mental reservations sworn to at the time of naturalization, it would be dangerous to assume that every new citizen will thereafter be a perfect citizen. In fact, that cannot be expected. It would not be a bad thing, therefore, to make naturalization either temporary or conditional for a period of five or ten years beginning with the issuance of second papers, the conditions in this case being not unlike the others, providing that in the case of felony, which in our law is often interchangeable with misdemeanor, and conviction thereof in a court of competence shall render naturalization null and void, with deportation as the penalty.

Presuming, however, that deportation involved—as undoubtedly it would—serious complications with the foreign governments at interest, a substitute plan would be, after the British and French fashion, to establish a penal colony overseas, and the Pacific Ocean is full of islands that would be admirable and efficient for the purpose. The government fleet certainly can spare one or two ships to be used as penal vessels.

These sound like harsh measures, and needless to say the immigration sentimentalists, especially the organized ones, will be in Washington with bells and rings if such a plan were seriously considered—as it eventually must—by the Congress, but the situation has become critical. The government owes it not only to settled American stock but it equally owes it to the new citizens and aliens peaceably inhabiting our country.

Too much importance has been attached to the Americanization process by itself. The spectacle of granting citizenship on national holidays to hundreds and even thousands of aliens assembled for the purpose is, despite the auspices under which the ceremony takes place, the flags and bands and soliloquies, too much of a farce. It has all the earmarks of a community picnic, with the local judge and Congressman sitting in as the guests of honor. It lacks the quiet dignity of the court room; the solemnity of the hall of justice; the kindly but sharp jurist questioning the alien from the dais from which, a few hours before and a few hours thereafter, he will dispense justice to the people.

As I have stood before such a court, I can imagine what would be the effect upon the average immigrant if, after the prescribed interrogatory was over, the court should further impress the budding citizen by reading aloud the conditions under which said citizenship may be retained. It may encroach upon the court's time, such an arrangement, and courts in general are behind in their juridical work, but the making of American citizens is as solemn a task as the dispensing of justice, and Congress should make due provision for the purpose. Psychology within reason is potent; and who will deny that the ex-alien cannot be but impressed with his new status when he achieves it in the very halls of justice which, in the case of crime, would sentence him to the loss of citizenship, civil rights and deportation?

Uncle Sam's Duty Toward His "Ugly Duckling"

Concluded from page 12

to voluntarily release one iota of its power. Even President Harding has been unable to proceed with the reorganization of the government about which we read so much two years ago.

If a map of Alaska is superimposed on a map of the United States drawn to the same scale, it at once becomes apparent how difficult is the problem of governing Alaska by the present system. Alaska is twelve times as large as the state of New York, with settled communities as far apart as Maine and Texas, without a single board of county commissioners or supervisors, and only a Territorial legislature at a point corresponding to New Orleans. Imagine such a state of affairs, and you have a picture of conditions in Alaska. At present this country, one-fifth as large as the United States and inaccessible for the most part, is treated as a single county! The capital of the Territory is the county seat. The Territory is cut up into four divisions, and of the revenues from all sources, the interior and arctic divisions receive from the United States Treasury and expend as their share practically as much as the other two divisions, although together they do not produce one-tenth as much revenue as the southerly divisions. This is manifestly unfair, for it means that the scattering industries and business establishments of the southerly divisions are taxed to maintain schools, build roads, and otherwise aid in the development of great areas that produce only one-tenth as much as the richer and more settled divisions. If the Panhandle section of Alaska, or even that section of Alaska east of the government railroad and south of the Yukon were made a state, or if the whole Territory were given full Territorial government, the efficiency of government would be increased and the burden of taxation in the region south of the Yukon and east of the government railroad reduced, while the northwestern section, if divided off as a territory, would continue under the present régime, probably with Nome as the capital.

What is needed in Alaska is a general reconstruction of our Alaskan policy, or, rather, the creation of a program where none now exists. Alaska is an asset, not a liability. It is to her that we must look for a future supply of pulp wood and paper, for the danger of a Canadian embargo on pulp timber is always present. With a total area of 590,884 square miles, Alaska has 64,000,000 acres of land suitable for cultivation, or five times the number of acres under cultivation in Michigan. There are more than 65,000,000 acres on which cattle, sheep and horses can graze. There are coal fields hundreds of miles in extent as yet unexplored. Her great forests stretch over an area nearly equal in size to Indiana. Her climate is similar to that of Norway and Sweden, and she is far richer in natural resources than the Scandinavian peninsula. Yet Norway and Sweden boast a population of eight millions, while Alaska is said to have thirty thousand whites. This is in itself the strongest indictment of long-distance, bureaucratic rule—or, rather, misrule.

No country in the world has been so grossly libeled or generally misunderstood as Alaska. The average American associates Alaska with polar bears and Eskimos. Polar bears are plentiful in Alaska, but so are children and schools. And it is seldom that a child is compelled to miss school because of inclement weather. Can the same be said of North Dakota, for instance? The Alaska of Jack London, of gunmen and dance halls, is past, despite all we see in the movies to the contrary.

Alaska has fourteen incorporated towns, in which one will find the same sort of folks and social life that one enjoys in towns of the same size throughout the United States. There are sixteen schools in these incorporated towns and districts, and about sixty-five in other and less densely populated sections.

You will find the telegraph, wireless, or cable everywhere except at the northernmost tip of Alaska, and there is only one important port that is cut off from "the outside" by ice in winter.

What the country needs, besides a change in the attitude of Washington toward it, is the sort of pioneer that built up the Great West. The new railroad needs a colonization expert and a traffic-getter; a railroad, unlike "Topsy," cannot "just grow." It must have feeders and a traffic manager to provide freight; the new railroad has neither. Alaska also needs a super-publicity agent to keep her before the world in her true light. She needs in New York or Washington an "Alaska Society," similar to the Japan Society, which has done wonders for that Island Kingdom. She needs capital, but capital is too wary to flow into the country while Washington bureaus hold the power of life and death over Alaska, her industries, and her natural resources; the pioneer who goes to Alaska must be offered the liberal inducements that persuaded the same sort of pioneer to settle the Great West.

BRIEFLY TOLD

The farmer girls in Holland wash their faces with whey to improve their complexions.

James John Davis, Secretary of Labor, was born in Tredegar, South Wales, in 1873.

King George of England is a radio fan.

A camel in the midst of green grass languishes and grows thin, but surrounded by sagebrush and thorny desert vegetation he is thoroughly happy and contented.

The famous old Arrow Rock Tavern, on the Missouri River, in Missouri, has been purchased by the state and turned over to the Daughters of the American Revolution. The old tavern was a place of rest and refreshment for the southwestern trader and plainsman. For some time it has been a depository for articles of historic interest. One of these articles is Daniel Boone's fiddle.

American sailors of the United States *Edsall*, a destroyer of Vice-Admiral Long's European squadron, took over children from Smyrna, destined for a refugee camp, and established them in an institution prepared for them in Constantinople. The children were rescued from Smyrna at the time of the disastrous fire and were loaded on a ship bound for Mitylene, the Greek concentration camp, a place of untold horrors. The crew prevailed upon the commander to take them aboard the *Edsall*. The sailors willingly gave up their quarters, instructions were wirelessed ahead to Constantinople, and provision made for their support by the crew of the *Edsall*. Each member of the crew contributes his bit on pay day toward the orphanage.

Mrs. Maud Howe Elliott, daughter of Julia Ward Howe, author of the "Battle Hymn of the Republic," is once more an American citizen. She was recently naturalized in the superior court, having applied under the act of Congress permitting American-born women who had married foreign subjects to regain citizenship. She married a British subject in Rome, twenty-five years ago.

The National Jewelers' Association has shifted the golden anniversary from the fiftieth to the tenth year of married life, and made the twenty-fifth the highest of wedding anniversary days. A great majority of marriages, through death or divorce, do not endure 25 years.

Cardinal Michael Ritter von Faulhaber, archbishop of Munich, rode from New York City to Boston in a day coach with his entire party, despite arrangements having been made for a parlor car. "I will turn over the Pullman fare to my poor hungry children in Munich," was his explanation.

A new geyser has erupted in Norris Basin, Yellowstone National Park.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The Galapagos Islands lie under the equator off the coast of Ecuador. The air is frequently chilly, due to the cold antarctic currents which fan the coast of Peru and strike seaward toward the island group. Wild goats, cattle, cats and dogs, as well as hidden treasure, bear evidence of pirates. The soil is rich red loam, nearly stoneless. There are but 3,500 head of cattle at present on Cristobal Island and it can easily support 50,000. It is said that a three-year-old steer brings $100 (gold) live weight, at Guayaquil on the mainland—when a steamer can be induced to call and take the stock off.

The Anti-Saloon League was founded by Dr. Howard H. Russell, at Oberlin, Ohio, in 1893. It does not consider its work finished and "will agitate for real enforcement of the dry law throughout the country."

For every dollar invested in the Arizona campaign for prairie-dog eradication in 1922, there was a fifteen-dollar return in the value of farm products saved from destruction by these pests, according to reports to the United States Department of Agriculture.

Crown Prince Hirohito, of Japan, mixes freely with the common people and defies the traditions which would hold him sacred.

Shark steak resembles in taste that of tender veal. Ostrich meat is similar to that of turkey.

There has been in this country nearly 3,000 child suicides within the last four years. The rate increased from 477 in 1919 to more than 900 in 1922. Prominent authorities attribute the increase to drinking among the younger set, particularly those of high school age.

The youngest man in the United States Senate is C. C. Dill, from Washington, aged thirty-eight years.

The whaling industry is very promising this season. Whales are reported early and plentiful on the grounds, the whale oil market is on the climb, and the demand for canned whale meat has become so pronounced that the prospective pack of the British Columbia whalers is already disposed of. The canned whale meat is mostly distributed from England.

More than 200 species of plants yield latex from which rubber may be obtained.

Nineteen thousand insects are required to make one pound of cochineal dye. Only the bodies of the females are used. They are wingless and each one produces over 1,000 young which spread over the plants rapidly.

It is White House etiquette for the President to be served first at dinner.

The Japanese are not affected by the act of Congress of 1919, granting naturalization rights to any persons of foreign birth who served in the army or navy during the World War, Federal Judge Lowell, of Boston, ruled recently. He said that it was the settled policy of the United States not to admit any Japanese to citizenship.

A. Owsley Stanley, United States Senator from Kentucky, says, "There is not at this hour left a single 'inestimable privilege' or 'inalienable right' mentioned in the Declaration of Independence and secured by the Constitution which is not openly invaded or secretly undermined by some paternalistic project or subversive propaganda."

Emilio Aguinaldo, Jr., the son of the former Philippine rebel leader, was graduated from Phillips Andover Academy recently. He plans to enter the Naval Academy at Annapolis in the autumn.

The Chinese bandits, who kidnaped for ransom many prominent American and European passengers, said they learned how to wreck the train by watching an American motion picture.

A bell dating back to the time of St. Patrick has been found in the ruins of Nendrum Abbey, in Ulster, Ireland.

"A Five-cent Piece": A Dialogue Between Uncle Sam and a Banker

A Dollar of Unvarying Value, Issued by Government, the Nation's Need

By THOMAS JEFFERSON SANDFORD

MRS. O'BRIEN kept a grocery store and sold thread at five cents a spool. Mr. Brown, a tailor, lived across the way and sent his boy after a spool of thread, but Mrs. O'Brien would not give the boy the spool of thread without being paid five cents for it, because she wanted to buy five cents' worth of peanuts for her little daughter from an Italian at a street corner, and the Italian wanted the five cents with which to buy his boy a lead pencil, while the merchant selling the lead pencils was anxious to purchase for his son a top, with which to play on the school-yard concrete. For the reason that the tailor's son did not have the five cents with which to purchase the spool of thread, all these exchanges and gratifications, which the five-cent piece would have brought about, could not occur; together with a great many other exchanges and gratifications that might have resulted from the tailor's boy having the five cents and paying cash for the spool of thread.

About this time, Uncle Sam wanted a nut screwed on the bolt of a bridge which was used very generally by the public, and offered a mechanic a five-cent piece which Uncle Sam had made from a lump of nickel he had in one of his mines, which lump of nickel Uncle Sam paid a miner one mill to take out of the earth.

The Right of Government

WHEN Uncle Sam made the five-cent piece into a coin, he said, by law, that it would be received in payment of taxes and in payment of debts. Then he paid it to the mechanic, after the latter had screwed the nut on to the bridge-bolt.

As soon as the mechanic received the five-cent piece, he went to the tailor and paid him the five-cent piece for sewing a patch on the mechanic's trousers. When the tailor received the nickel coin, he sent his boy for the spool of thread. Mrs. O'Brien then parted with the spool of thread and spent the five-cent piece for peanuts which she gave to her girl. The Italian then bought the pencil and the stationer purchased for his son the top; and the nickel is now, probably, going in every direction, into pockets and out, into cash-drawers and out, enabling all kinds of people to supply their small wants and gratify a great variety of small desires.

Who can describe or calculate the innumerable exchanges that may be effected by one single, five-cent piece?

This magical power, which can be wielded by Uncle Sam, whenever he pleases, is one of the indispensable features of what the world recognizes as "sovereignty." When Uncle Sam started the nickel on its joy-effecting rounds, by having a mechanic make a bridge safe for the public, and paying the mechanic for his services with a quantity of law-created-value, annexed to a little man-made-value, which could not exist without the material made by God or Nature, he added to the joy and comfort of many persons.

This enormous and miraculous power should never be turned over to the manipulation of any private individual or any combination of private individuals?

If each person receiving the nickel would take each other's promise to pay the nickel, one year from the time each made the purchase, the same exchanges could have been made; but each person or at least many of them would not be satisfied with each person's individual promise to do something a year after the time at which it ought to be done. Some of the promisors might die.

Sovereignty—Not Credit

CONSEQUENTLY, Uncle Sam with his prodigious power of sovereignty (not *credit;* for Uncle Sam is too rich, in his possession of natural resources, to want or need credit from any of his dependents) says by law: "I shall receive the nickels in payment of taxes which you people will always owe me for this property of mine, which each of you is using. You will always owe me something every year. After you pay this year's taxes, you will owe me the following year's taxes; and whatever I receive in payment of taxes, you will all want again to pay your own yearly taxes. Because I say, by law, that five-cent-nickels shall pay taxes and discharge debts, you all, or the majority of you, want the nickels and Mrs. O'Brien knows that also; so she accepts the nickel in payment for a spool of thread and then the nickel goes on its rounds effecting exchanges, supplying wants, and satisfying desires; and no one is obliged to wait one year, before getting the nickel to start the wheels of prosperity a-moving."

This power to make nickels is almost equal to the whole power of the people of the United States to produce food, clothing, shelter, and many other things; for the reason that when the government is operating smoothly, most people would sooner have the nickels, which can at any time be exchanged for food, clothing, shelter, and other things, than to have on hand the food, clothing, shelter, and other things. Most persons do not want food, clothing, and shelter, until they are ready to use them; and therefore prefer to hold an almost imperishable thing, such as a nickel, which will exchange, at almost any time, for the things they may want to use in consumption.

Bringing this nickel into being is characteristic of "sovereignty" and no one should be permitted to exercise this prodigious power under this government, in modern times, except Uncle Sam, and then only in acting as an agent of the whole people. Every one in the United States has more confidence in the ability of Uncle Sam to carry out his agreements, no matter how long the period over which they extend, than they have in the ability of any private individual or number of them, who enter into contracts to do or refrain from doing something.

Uncle Sam is the highest and greatest owner of real and personal property in these United States and therefore has a natural and a legal right to say what kind of material the people using his property must pay him as rent (frequently miscalled taxes) for the privilege of using said property. Whatever material he receives in payment of the public rent or taxes, naturally and legally due him, that material every one in the United States will want more or less, at some time or another.

By the means of his control over the supply of this material, designated by law as receivable in payment of rent (taxes), he can build bridges, schoolhouses, public roads, post offices, hospitals, buy materials or employ men; inasmuch as almost every one will give something useful and desirable for the material received by Uncle Sam in payment of rent (taxes) due for the use of his property; because they know they can change said material for things similar to those which they gave for the material, at any time.

Mrs. O'Brien knew when she parted with her spool of thread and received a nickel that others would give something about equal in value to the value of the nickel for it; but she probably did not know that the paramount reason for almost every one wanting the nickel was that Uncle Sam would receive it in payment of rent (taxes).

Uncle Sam can do marvels with this miraculous power—employ, facilitate exchanges, eliminate poverty, educate the ignorant, alleviate the sufferings of the downtrodden, take advantage of the forces of nature, speed up this or that industry, set idle laborers to work on idle land, transforming dirt into articles of use and ornament, and a thousand and one other things.

Who is the man that has the temerity to affirm that this gigantic power should be delegated to private individuals or several private individuals, organized into a legal entity, called a corporation?

Listen to the argument of the banker who asserts that Uncle Sam should have nothing to do with the banking business and has been *scheming* ever since Alexander Hamilton sowed his rank weeds of financial fallacies.

The Banker's Argument

THE banker, addressing Uncle Sam, says: "Sam, this kind of a five-cent piece which you have coined from the nickel in one of your mines is a debased currency, and generates a fictitious prosperity: a prosperity which is not real ("Although," thinks Uncle Sam to himself, "it is a prosperity which supplies every one willing to work with better clothes, and more of them, better food and more of it, better homes and more of them; than the prosperity which preceded the alleged fictitious prosperity.") but only the shadow of reality. I'll tell you how to do it. I am a rich man. I have plenty of gold. You give me the privilege of using your stamp, in which so many have the greatest confidence, and I will coin a nickel out of one cent's worth of my gold by taking it to one of your mints, and if my yellow metal is nine parts pure gold and one part copper alloy, you are to do the coining for me, free of charge. Whenever you want to build a bridge come to me and I will lend you a pewter nickel, secured by a paper bond, in which you will agree to pay me back the nickel and three nickels in interest added, at the end of thirty years. But you must keep some gold nickels, lying in reserve in your treasury, to give to me, in exchange, for any one of my nickels, whenever I want a gold nickel instead of a pewter one. This is a sane and safe method of issuing money for me; and whatever is good for the conservative banker is good for the government.

"In this way, the United States Government will keep out of the money-issuing-business and will avoid all the pitfalls of inflation, to which the intelligent bankers of the world have so much aversion. Besides you can keep my gold nickel in your treasury and if any one wants a gold nickel, instead of a pewter one, give it to him; and if he knows as much as I do, he will not carry his gold nickel around in his pocket; because, if he does, and carries it around long enough, his gold will evaporate into his pocket lining, and he will have only a semblance of a gold nickel left. Very few Americans will want the gold nickel and those who do, will generally be ignorant foreigners who don't know much about finance, anyway."

"But, why," asked Uncle Sam, "should I store your gold for you, free of charge, as well as let you place the Stars and Stripes on your subordinately owned gold, free of charge, and, at the same time, deny this privilege to the owners of platinum, which is a much more valuable metal, weight for weight, than yours? This is the whole people's government and should not be run in the interest of any class."

"But the rest of the world gives bankers this coinage-privilege, free of charge, and you should fall in line because the gold dollar or gold nickel is the money of the world."

"If the rest of the world," replied Uncle Sam, "makes a mistake in giving gold-owners a 'snap,' I see no reason for my committing the same mistake. Besides, I don't know what you mean by the money of the world; and that gold money circulates abroad better than any other kind of money," objected Uncle Sam.

The banker now commenced to blink his eyes and looked furtively out of the window, as the suspicion flickered through his mind that Uncle Sam might be too intelligent to swallow this falsehood.

Sam's next statement showed that the banker's suspicions were well grounded.

"Why," asserted Uncle Sam, "I am told by American tourists that when they take American eagles to London, most shopkeepers will not take them, only at discount, because eagles are not legal tender in England and also because they do not contain as much gold, weight for weight, as English gold coins which are eleven-twelfths pure gold; whereas our coins are only nine-tenths pure gold. What do you say to that, in the face of your statement that gold circulates around the world?"

Eagles and Pounds

"WELL!" replied the wily banker, "If gold eagles are worn away too much, they suffer a little discount, because they must be shipped back home and it costs something to ship them and to pay for the insurance; but there is no money so good abroad as my gold with your stamp on it."

"I don't believe that statement, Mr. Banker, for the reason that I have been told that a pound of American eagles do not buy as much tea in China as a pound of English gold. You see I know that a pound of English gold contains only one-twelfth of a pound of alloy; whereas a pound of our American gold contains one-tenth of a pound of alloy. I think you are trying to 'string' me. But that is not the point.

"I can't legislate for the outside world. I can only legislate for my American sovereigns. That on which I place my stamp immediately becomes valuable. If I stamp a piece of paper 'One Dollar' it buys as much beef, pork, lumber, sugar, oil, cotton, wheat, or anything in this country, as does one of your new gold dollars with my stamp on it. Take my stamp off your gold dollar and my paper dollar will buy more. If I print 'One Hundred Dollars' on the same piece of paper, it will buy, in the United States, one hundred times as much as your gold dollar, and when your gold dollar is worn down thin, my paper hundred-dollar-bill will buy a great deal more than one hundred times what your gold dollar will buy."

"Not one hundred times as much as my gold dollar will buy in a foreign country," retorted the banker.

"Yes, it will, in most so-called Christian countries, when we allow a 'money-scalper' something for commission, something for insurance and something for shipping the money, it comes back here, where it goes over my tax-counter and where it will buy anything on a farm, in a store, in a warehouse, or pay any debt owed by one private United States citizen to another, anywhere in these United States.

"But I am not going to permit you to 'camouflage' me. You bankers have so bedeviled our laws pertaining to money that we have twenty-two different kinds of money, now, circulating in the United States alone.

The Twenty-two Varieties

"WE HAVE United States Old Demand Notes, Seven Thirties of 1861, United States Legal Tender Notes of 1862, Paper Fifty-Cent Pieces, Paper Twenty-Five Cent Pieces, Paper Ten-Cent Pieces, Gold Certificates, Silver Certificates, Treasury Notes of July 14, 1890, Gold Eagles, Gold Dollars, Silver Dollars containing 412½ grains silver, Silver Half-Dollars—two containing 385 grains, Silver Quarter-Dollars, Certificates of Indebtedness, Silver Ten-Cent Pieces, Nickel Five-Cent Pieces, Copper Pennies, National Bank Notes, Gold Notes, Federal Reserve Notes, Federal Reserve Notes secured under Pittman Act: twenty-two different kinds of United States money which have circulated, more or less, throughout the United States since 1860.

"This great variety of United States money has been brought into being under some financial 'hocus-pocus' of bankers; while the people were asleep—politically drugged by a bought and hired press.

"I want my stamp on only one kind of a paper dollar, backed by all the real and personal property I own in these United States; from the Atlantic to the Pacific, and from the Great Lakes to the Gulf of Mexico; and I want my money to vary so little in value, that it will take an expert to find out that it varies a particle in value."

"If," protested the banker, "you had only one kind

Church of the Transfiguration. The "Little Church Around the Corner," New York City.

Seventy-five Years of Joining Hearts and Hands

By FRANK DORRANCE HOPLEY

"GOD bless the little church around the corner." It was the veteran actor, Joseph Jefferson, who uttered these words and, at the moment, he had no idea that he had christened a church by a name that should cling to it for all time.

Jefferson's friend, George Holland, a noted actor of the day, had passed away, and Jefferson went to a church that then stood on the corner of Madison avenue and Twenty-eighth street, to make arrangements for the funeral.

The rector of that church, however, was creed-bound and stiff-necked. He believed that the stage and all those who acted upon it were the instruments of the devil. He would have nothing to do with them dead or alive, and declined to permit the funeral of Holland to be held in his church, but added, as Jefferson turned sadly away: "There's a little church around the corner that might do it."

The newspapers of the city got hold of the incident and exploited it. The story was copied from one end of the country to the other, and heralded to the lands across the sea. In a short time the Church of the Transfiguration had lost its identity, and became known all over the world as the "Little Church Around the Corner," which ever since has been its popular name.

The church was erected at Twenty-ninth street near Fifth Avenue at a time when that section of the city was open country. The parishioners came in carriages, on horseback, or walked across the fields to attend service.

Today the church is as originally built, but one story high. As the population of the city and the congregation grew, the building was added to bit by bit. It is a church of many gables; numerous small windows looking out where least expected; cornices and quaint doors. As churches go in the metropolis, it is considered small, but its deficiency in size is more than counterbalanced by its influence in the community. Through all the years it has stood as a bulwark to Christianity and to all that means in the life of a large city.

The "Little Church Around the Corner" is famous for its memorial windows, of which there are a considerable number, and in the erection of which the stage has not been forgotten.

One of the most attractive is one of brightly colored glass to the memory of that veteran actor, Edwin Booth. As one enters the church, at the left is a window dedicated to Montague, a matinée idol of the early seventies, which has for its design a pilgrim in his rough robe, and carrying a staff. On the right, is another window also representing the stage, and this one is to the memory of Richard Mansfield. The design in this case is a knight in full armor with a red cloak thrown about his shoulders.

Many famous hotels came into being and passed away. The "Fifth Avenue" at Twenty-third street where many noted political conferences were held; the "Hoffman House" at Twenty-fourth street where men of sporting tendencies delighted to congregate; the "Holland House" at Thirtieth street with its exclusive patrons, were erected, each a wonder in their day, reached the zenith of their popularity, and then gave way in the onward march of business to huge office buildings.

The Rev. GEORGE HENDRIC HOUGHTON, D. D.

First rector of the "Little Church Around the Corner."

The fashionable church whose rector refused to officiate at the funeral of Holland is no more and, with its minister, has long been forgotten, but the "Little Church Around the Corner" has held its ground. Tall office buildings loom to the right and left of the quaint little pile of stone and mortar, crowding almost to its very dooryard. Yet farther, it seems, they dare not go, for inside the fence that surrounds the little churchyard all is peace and quiet, and a subtle influence seems to say to the encroachments of commerce and industry, "You shall not pass."

The Church of the Transfiguration, or the "Little Church Around the Corner," to use its popular name, during its seventy-five years of existence, has had but two rectors. Its first was the Rev. George Hendric Houghton, D. D., who for more than half a century and until his death in 1897 served his people faithfully and well; the second, his nephew, Dr. George Clarke Houghton, who only in April of this year passed away.

The original Dr. Houghton, like his successor, was a man of most kindly nature, devoting himself and his energies to rich and poor alike, and taking to his heart those of all creeds, or of no creed at all, who needed help and consolation.

One of his first acts after being installed was to have small houses made and put in the near-by trees, so that the birds might have places to mate and rear their young. Even today with the roar of the city's traffic echoing through the streets, on the lone tree that is left in the churchyard, is a bird house that still shelters a family of very lively sparrows as each spring comes around.

Although Dr. Houghton was a high churchman, his creed was that of humanity rather than didactic. He believed that no minister should refuse the call of duty, no matter from whom it came or where it led.

"In the personal ministry of mercy and blessing," he once said, "no sin, no degradation, no sickness, no possible peril, can be a barrier to that ministry."

And Dr. Houghton practiced what he preached. Within a stone's throw from his church was the famous tenderloin district of that day, which abounded with houses of ill-fame, gambling places, and all sorts of resorts that catered to the lower passions of the people. But Dr. Houghton never hesitated to enter any of them if there came a call for help. Many a time he passed through the gay throng of men and women to hear the confession of one who was seriously ill, administer the last sacrament to the dying, or to counsel those in despair.

An incident of Dr. Houghton's fearlessness is told, which occurred during the race riots in the early sixties.

The Eyes of America Will Be on New York

IN NEW YORK CITY, where opposition to prohibition is a profitable profession and is very closely allied to racial, religious and political interests, the State Superintendent of the Anti-Saloon League, William H. Anderson, has at last been indicted. The wonder of those who have watched the process is that the indictment was delayed so long. The delay itself is a first-class confession on the part of the alien prosecutors that their case was pretty hard to make up and is scarcely expected to hold together for more than political and publicity purposes. The whole matter would be entitled to much more respect if opposed to Mr. Anderson there could be found one official with an American name, but apparently the Americans have kept out of it.

This is not a defense of Mr. Anderson nor of the Anti-Saloon League. It is recognized that those who fight the devil with fire sometimes get burned. When the League went into politics and won, it won by political methods, and it is not going beyond the facts to say that as many political tricks were pulled in the interests of decency as were attempted in the interests of evil. The country has so long been accustomed to good men who were good for nothing but talk about goodness, that it does not easily accustom its thought to good men who are just as sharp as the agents of evil and sometimes a little sharper. For example: the liquor business never had a "Pussyfoot" Johnson; if it had there would probably be no prohibition today. The liquor business has never developed any statesmanly representative. All its policies have backfired. The brains and the stategy have been on the other side.

Being in politics, aided and abetted by the moral sentiment of the country, the Anti-Saloon League did not always use church parlor methods, and it may well be that an examination of its program will reveal some interesting things, but the hope of its enemies that anything criminal will be disclosed is almost certainly doomed to disappointment. The directors of the League in New York are men whose long lives of public integrity and splendid service really give profound weight to their statement that they have examined all the affairs of Mr. Anderson and find him right.

If to reimburse himself for funds which he personally advanced to wage the fight Mr. Anderson yielded to the foreign idea of splitting commissions, rather than the American idea of fixed and definite pay for labor performed, he made a grave mistake. It was a mistake especially in New York where the idea of commissions and percentages is developed to its farthest point. New Yorkers, from brokers to gamblers, know to the smallest fraction the ins and outs of the rake-off and commission game. They know percentages backward as well as forward. When any American attempts to adopt their commission game to his uses, they know quite well how to punish him. That the metropolis should utilize the split commission as a means of "getting" a man it hates would be humorous, were it not that the grave issues involved transcend the personalities of Mr. Anderson and the individuals who assail him.

When the Anderson trial occurs, before a jury of New Yorkers, the court room will be pervaded by an atmosphere of hate unless the presiding judge takes extreme precautions. Enemies of prohibition, if not of Anderson, may seek to pack the courtroom. In so doing, they will deal their own cause a bitter blow. The eyes of the country will be on the trial. Real Americans lean backward in their desire for fairness. Should the Anderson trial develop signs of persecution rather than prosecution, it will hurt the anti-prohibition cause as much as Anderson's enemies hope his conviction will hurt the prohibition cause.

There Is a Way Out

A PRINCIPAL of public schools in Montana writes to direct attention to the school problem. Americans have always prided themselves on their educational system. Yet, few will deny that many sections of the land are improperly served. Sparsely-settled territory sometimes goes without the fundamentals, while many great cities, reveling in vast expenditures for school purposes, still marvel at the continuance of half-day sessions, at the crowded schoolrooms and at poorly paid teachers.

In the cities, taxes come easy under the spur of the cry: We need schools. Then the taxpayers often discover that their schools remain inadequate. Rapid growth of the communities is one reason for this condition. But too often, the proceeds of heavy taxation and big bond issues go to construction of ornate buildings. School boards can favor contractor friends by giving them frequent and costly building contracts. But appropriations used in ornament cannot furnish necessary school facilities.

Problems of city and rural community are alike the nation's problem. It would be, perhaps, unwise to make education, as a whole, a Federal business. The extension of the Government overhead has already been too vast. But there are ways of cooperation and conference whereby many school problems could be worked out. When these means fail utterly, it should be possible for nation and state to assist the communities whose system of local support for education is inadequate.

The Farmer Gets Advice

WHY should the farmer protest? True, wheat is below a dollar. True, there is a great and unexplainable margin of price between the amount the farmer gets for his product on the farm, and the amount the consumer pays for that product when he buys it. It is also true that the farmer asked for markets, and they gave him a lot of laws.

But there is something else the farmer forgets when he complains that his lot is not a happy one, something for which he is not truly grateful when he takes a long swing of his cowhide boots and kicks out a government which does not accomplish what he desires.

Everyone has been generous to the farmer. From Vice-President Coolidge down and from Wall Street westward, the whole country has reached right to the bottom of its capacious heart and withdrawn something which it has given free to the farmer.

It is advice.

There has never been a question of the country's generosity in this regard. We have always been 100-per-centers in giving. We have told the farmer how to market, when to market, why to market and to whom to market. We have told him what to sow and where to sow. We have told him everything in the world he might want to know. We have given everything we had in the way of advice.

And he isn't grateful. It's a shame.

He Made Us Laugh

THIRTY years ago, one circus clown gave another clown a medal on which was inscribed, "To the man who had sense enough to play the fool."

The recipient of the medal died the other day at 79. He had run away from home in boyhood to join a circus. For 68 years he clowned in 55 different circuses. He played the fool before millions of persons. His buffoonery gave those millions the priceless boon of whole-souled laughter.

Kings and statesmen have given the world tears and sadness. The finest of intentions have sometimes brought sorrow to those for whom only good was meant. But Al Miaco with no attempt to force his good deeds upon the world gave his world the thing before which worries, troubles, griefs, and mad ambitions vanish—laughter.

The names of those who have brought trouble in the world live long in history or legend. Al Miaco and his kind are soon forgotten. But it would be a rash person who would say that those of great name have done the world more real good than those who have clowned so well that merry hearts succeeded sad ones.

The 1890 Census as a Guide?

A FORMALITY of sovereignty has been the chief obstacle in the way of rational immigration safeguards for the United States.

Congress has been reluctant to put into the law a provision requiring examination of prospective immigrants in the land of their origin. This reluctance has been due to the fear that foreign nations would look upon such an American governmental agency as a blow at their sovereign rights.

Italy was the first to indicate to the United States that she would co-operate with us in the restriction of her emigration. Now, the Manchester *Guardian*, one of the most influential newspapers in the British Empire, has suggested that it would be wise if American consuls abroad were strictly limited in the number of passport visas they might issue to those who planned to go to the United States to live.

The opinion of the Manchester *Guardian* is likely to become the opinion of the British people. Analyzed, it is an opinion that England is willing to foreswear an idle formality of sovereignty to permit the substance of a well-regulated migration of peoples of one land to another.

Events since the 1923-24 immigration quota became operative have accentuated the imperativeness of changing the detail of the present immigration law. July was not half over before the quota of immigrants from the British Empire had been exhausted. Some of those who arrived immediately after the quota of Great Britain was exhausted were Scotch shipbuilding workers, whose labor was urgently needed in this country and whose qualities as prospective citizens were granted to be ideal by the Ellis Island authorities. To invoke emergency proceedings on their behalf was unfortunate.

Senator David A. Reed, of Pennsylvania, has never been numbered among the ardent restrictionists. His views on immigration have been similar to those who believe our industrial needs rather than our racial problems should determine the number of foreigners we accept. But he recently was quoted in expression of views which place him in line with those who hope that American stocks be not destroyed by hordes of non-assimilable aliens.

Senator Reed suggested that the 1890 Census be made the basis on which quotas are determined. He suggested then that quota percentages be increased. He said that such a change in the law would increase vastly the skilled labor the country would receive. English, Scotch, Irish, Germans and Scandinavians would be the persons whose admissible immigrants would be increased by this change in the law.

Senator Reed's suggestion is a wise one. Whether the reason be the one he gives, or the one that the North European stock is more likely to display the mental and physical qualities most in keeping with American tradition, the result will be the same.

The quota laws should be changed to make possible a healthy and controlled immigration of persons fitted to become real American citizens. And no time should be lost in procuring agreements with foreign powers whereby examination of prospective immigrants may be made at the source.

Service With Safety

AIR mail will become an important part of our national life. Cost and the difficulties of selecting air routes, which will satisfy the major portion of the public, will delay its expansion, but the service will come.

The Post Office Department reports that the air mail service performance during the fiscal year of 1923 was 96.73 per cent perfect. The department holds that air mail service can be operated with the safety and the certainty of rail service. During the fiscal year which closed June 30, airplanes in the mail service flew 1,589,389 miles. Experienced pilots, and a careful system of inspection, enabled the department's air service to cover that distance with the record 96.73 per cent.

During the fiscal year which closed June 30, 1922, the postal air service rated 95.52 per cent. The year previous it was 92.84.

Steady improvement has been shown in the service, and in the cities which are granted the service, there has been clear evidence that the public is pleased by its operation. Safety, in the last analysis, was certain to be the determining factor in the success or failure of aerial mail. The public wants its letters carried with the greatest possible speed, but the public will not demand speedy service when the price is life or limb. The Post Office Department's finding that safety in aerial mail is equal to that in the railway mail service assures the development of the former service to a state of highest efficiency.

Mr. Ford's Page

IT IS a luxury to express an individual opinion but quite another thing to examine a multitude of opinions to discover what is the meaning common to them all. People have a feeling that by voicing some kind of complaint they are adding to the general sum of information or helping to establish a creative situation. When you analyze what they are saying and then try to learn from that what it is they are thinking, and then go on another step and try to see whether their thinking and their talking point in a direction of action, you are quite likely to be disappointed. There come times when even the voice of the people means nothing whatever, so far as showing the road ahead.

It seems that following the methods which all well-organized businesses have used for years, the enterprising publishers have conducted a broomsweep of public opinion, and have emptied their dustpans before the generality of newspaper readers. One looks through the sweepings and finds this or that, but certainly finds no clue to the real question. One finds personal choices for or against this man or that; one finds everything superficial, and not one element of constructive criticism. One fails to find even the remotest suggestion that people have yet begun to identify the objects of their protests or desires.

IF THE people really set their minds on anything it is impossible to prevent their getting what they want. But even with that true, it is necessary that the people shall know what they want. It is doubtful that a change for the better can come through a political election. It is a serious question how far our problems are politically solvable. But one thing is certain—rosy promises will not be accepted by the people now, regardless of who the man may be that makes them. Nobody knows what is going to happen, nobody knows how to try to make anything happen; and until a clear idea evolves in the public mind it is useless to try to forecast the future. One thing you might ponder: There are a number of things to be done in the United States that have no connection with elections.

If there is anything to be corrected it would seem that the public mind ought to be clear about that. If there is anything definitely to be done it would seem that that public intelligence ought to be able to put its finger on the matter involved. Instead of that we appear to have entered a blind alley of discontent in which it seems impossible to do other than use the names of men, wishing that one were there and the other were here. It doesn't do any good; it doesn't help the country; it simply shows how little the people really apply their minds to the fundamental question.

No reader of this Page will ever accuse it of flattering that which passes for the public mind. This Page is not political and has dealt candidly with public questions. Politicians seeking office may find it to their advantage to tell the people that they are the depositories of all wisdom, but observers who know how the people neglect their own business are of quite another mind. In some respects the public shows less interest in its own collective interests than the poorest man would show in his. Becoming part of a crowd lowers the rate of intelligence.

It comes to this then that in spite of what is called the unrest, in spite of all the expressions of opinion pro and con, in spite of all the various methods used to discover what the public mind is thinking, there is as yet no definite complaint formulated, no definite program outlined to follow.

Most observers will probably concede that. But there is a difference in the attitude which observers take toward the point. Some feel urged to try to change the fact. Others feel that the better way is to recognize the fact and if possible find its meaning. Now it is plain to all that if the people have no plan to follow, they are not going to follow any plan. In this country if the people set their minds on anything it is impossible to prevent their getting what they want. And with that true the fact that they do not know what they want is a tremendous fact. Facts always are tremendous things, whether or not they are conformable to our desires.

So taking the situation as it is, instead of making a puzzle and a worriment out of it, why not simply try to get the meaning out of it. The most common mistake is made by taking counsel of the thought that things should be different than they are. It is true that they ought to be different—morally anyone would say that the situation is wrong anyway you look at it—but the point of the matter is that this is the situation.

The judgment of men who have looked over the ground is something like this:

Like a change of cosmic seasons something is coming to the world of humanity; but to suppose that destiny waits upon elections is to confuse the temporal with the eternal, the passing phases of things with the lasting principles. The New Era is not dependent on elections. It overlaps all kinds of human conventions. Men are twice deceived, once when they think they can bring in the New Era by committee meetings, and again when they think that because their committee meetings have failed the New Era is delayed. The great changes come regardless, as Spring and Autumn come.

There is no certainty whatever that the change for the better which the people of the United States are desiring can be obtained by a political election. It is a serious question how far our problems are politically solvable. To say that is not to cast aspersion upon the honesty or ability of political assemblies; it is simply to suggest that perhaps the political tool is not the Best tool for the special purpose. Political office tends to become more and more a series of clerkships and it has been an open secret for some years past that the most creative type of Americans do not desire to be clerks even though their clerkships carry high titles. We passed beyond the scope of titles years ago. It may be that part of the educational discipline of our own people, the American people, is to learn by still another attempt that the thing they desire and need is not in the gift of any government but in the possession of themselves to bring into being by their own activities. When our people regain a measure of self-reliance the failures of political clerkship holders will not be so important.

As the situation stands now there is no one who tells the people where to go or what to do. There are, it is sadly true, individuals who for their own personal advancement would take advantage of the unrest of the people and who by making the old impossible promises would attempt to rise into this or that office. But even rosy promises will not be accepted now, regardless of who the man may be that makes them. Which statement completes the array of facts concerning the public mind. To use street language nobody knows what is going to happen, nobody knows how to try to make anything happen; and until a clear idea evolves in the public mind it is useless to try to forecast the future. One of the features of these times is that no one has the audacity to forecast the future.

What one man would suggest is this: that while we are waiting to see what will happen with reference to elections and things of that sort, there are a number of things to be done in the United States that have no connection with elections. There is always something to do around your own farm while you are worrying about the troubles of Europe.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Foreign-language Press Can't Justify Self

No Attempt Made to Americanize Aliens Exploited by Its Advertising

By A. R. PINCI

THE first day of July, which emigrants to the United States have transformed into a sort of lottery day, with admission into the United States as the prize for those first arrivals who may qualify under the so-called three per centum law, has just passed into that history which tradition wills that it must repeat itself—and of late has so done.

All being equal as between prospective immigrants, the race actually is one between ships maneuvering for the technical advantage of being the first to anchor at quarantine the first day of our fiscal year. First place having been attained, this confers a legal benefit upon that group of humanity that seeks to land in this country for any one of many reasons.

But while a great deal has been said about immigration in general and this novel annual July farce, virtually no attention has been paid by the American Government or by impartial investigators to what is roughly called the "immigrants' press," that is to say, the hundreds of foreign-language newspapers (although few deserve this name) printed in the United States and circulating among the respective forty principal nationalities located here.

Because these periodicals are published in the United States they are not necessarily American. Many of them are anything but that. Of these, most claim to be Americanized, if not American, and the rest do not even make that claim. Some of its editors have declared to the writer that it is impossible to publish an "American" periodical in a foreign language, but this arbitrary impossibility is a state of mind and not an actuality.

While Americanization in the end means absolute conversion of the immigrant group to the English language, it is meanwhile possible to be American in a foreign language if this is used solely as the medium of unilateral understandability—as the means to lubricate the foreign mind to American sociological machinery. It is not a matter of language at all, although language influences the spirit of this press. Any of our own newspapers, translated into any language or dialect, from Albanian to Zulu, would still be American, but any foreign newspapers, translated into English, even with the addition of the most current popular idioms, would not be American.

Unfortunately—taking our foreign-language, or colonial, press as an entity—the alien languages which cloak it react as a brake, notwithstanding the good intentions of some of its publishers. Excepting those newspapers which actually retard the Americanization of its readers, the others are not hastening the process, despite their claims or beliefs to the contrary.

It would not do to apply sweeping generalities in considering this rather complicated problem. It would be unfair to say that in a nation like this, with a fair percentage of its population still belonging to the foreign-language class, the foreign-language periodical failed to be useful. On the other hand, some evident facts are met with which indicate that this alien press is less concerned with the ultimate Americanization goal (where and if it exists at all) of its readers, than with its own well-being. In other words, it is safer to assume, from an American standpoint, that the average foreign newspaper in the United States exists not for the class or group of readers to which it caters, but because of it.

Ignore English Language

OUR alien press can be safely said not to be conducive to Americanization by the essentially limited and local character it assumes and has, for a long time, assumed. The chief indictment against it is its failure not to print so much of it as is editorial in English as well. Editors of some of these newspapers have told me that a foreign-language newspaper "is no medium for anything printed in English," but the fact remains that it is the very medium which should publish in English so much as may be of local interest to the nationality involved which the American newspapers of the vicinage are unable to carry on their own account.

It is true, of course, that during the past few years some of these foreign newspapers have experimented with an English column, page or section, but this was not due to localized editorial evolution so much as it was an effect of certain war measures, and more specifically censorship, dealing with the aliens in America. That was the first sign that ever came from Washington proving that the authorities discovered the odd and mysterious power exercised by the foreign-language press.

The foreign-language press in our midst will not justify itself, from an American standpoint, until it makes due and full provision for non-news material in English as well as the language of issue. Aliens in the United States have every right to become acquainted with news in the language or dialect they understand best, and the same may be said of the opinions and influences which the editorial pen exerts in their behalf, but these opinions and influences, expressed in American territory for the benefit of local and largely unassimilated residents, automatically become vital material to American citizens.

Some foreign editors do not realize it; the majority, however, refuse to acknowledge it. After all, until the alien is thoroughly assimilated, his point of view is at variance with the American point of view; in not a few cases this variance amounts to overt opposition. It is this feeling, more than any other one thing, that makes the foreign-language newspaper so vital and, at the same time, so critical. So long as said newspapers cater to colonies of foreigners who consider their own idiosyncrasies and prejudices above American requirements and customs, there is bound to be a feud between the foreign-language newspaper and the United States as a nation.

The foreign editors, if they are pressed for a reason, plead that they wish to set forth the viewpoint of their conationals, and if that excuse should fail to satisfy then they fall back upon the gag of freedom of the press. Not a little sabotage, or something like it, is carried on in our foreign-language press for no other reason than the freedom of the press authorizes it. But—and this fact is respectfully commended to the attention of our legislators—there is, and there should be, a distinction between freedom of the American press in the United States and freedom of the alien press, especially where the two are twain and seldom meet. If a foreign statesman of third rank, speaking officially, said some of the things that editors of identical nationality are saying every day in our own United States, the Department of State would be demanding one explanation after another and Congress would add a few echoes of its own to boot.

Two Powerful Politically

POLITICALLY, the only powerful nationalities represented in the alien press in this country are the German and the Hebrew. The Italian, numerically conspicuous, is politically unimportant. The Scandinavian group is the only one which, winning the race for Americanization, has carved a niche for itself in the Washington halls of fame. And Americanization will fail to be one hundred per cent efficient until other nationalities finding asylum in this country begin to produce a line of Knute Nelsons. Even the Germans failed to do it so far.

Having no political influence except locally, it is evident that the foreign-language press can be useful in close contests in neighborhoods predominantly alien, but this usefulness in general is available to the best customer. Sometimes—and it has happened quite often—they are unable to deliver as much as they promise, whereupon they are obliterated technically or bodily. The birthrate and the mortality of these foreign-language publications is amazing. N. W. Ayer & Son's American Newspaper Annual and Directory frankly explains, editorially, that it cannot include in its directory periodicals which are not likely to survive, and it is not difficult to realize that not a few of the periodicals included in its foreign-language list have got in by the skin of their teeth.

Competition between and among related foreign-language periodicals catering to aliens in this country is of all kinds and colors. Some of it involves cutthroat methods. Taking into consideration the fact that the genesis of some of these newspapers does not conform to commercial ethics, that their paternity is no less obscure, that their object is not news or education but propaganda, and that all seems to be fair for them in seeking their object or objects, not to mention other details as to individual fitness for such responsible semi-public positions, one must conclude that the sooner the foreign-language press is better controlled by suitable means the better it will be not only for Americans but for the alien readers.

It is only a few months ago—last December to be exact—that a new Italian newspaper was established in New York City. Preliminary and costly propaganda had paved the way for a mild reception of the first issue. The fact that it was edited by a noted Italian newspaper writer—belonging to the intermediate European school of feature-and-essay journalism—was stressed. At first it was rumored that a powerful Italian bank advanced the "unlimited" funds available for the new daily; then it appeared that a wealthy Italian oil man of Texas was the angel. But the point that has never been made clear was the message this venture was supposed to carry. To date it has carried none.

The new newspaper, y-clept an American courier, contains nothing that is American. Since its editor is bitterly opposed to the American immigration idea, and wants to "know what the American people want" in the way of immigration, it is inevitable that he is instinctively anti-American. He admires New York City; he is ecstatic over the United States of America—because, he vows, the Italian laborer—the man of brawn with pick and shovel—has dug the trenches of the subways, laid the foundations of the skyscrapers and graded the roadbeds of our transcontinental railroads. This past performance he considers as an indefinitely open title to incoming Italian emigration. He forgets that the immigrants who wrought all of that include thousands of first and second generation Italians, naturalized in most cases, who are now landed proprietors, or the parents of well-to-do professional or business men, and thus enjoying the reward of priority and effort. In what way the prospective emigrants in Italy waiting for a chance to go to the United States are related to prior emigration is not clear.

Now what the Italians, and other national groups of alien residents, need, is not more newspapers in their language, but fewer. How few cannot be determined, but the fewer the better. There are too many of these colonial periodicals which thrive upon income derived from circulation and advertising that ought never to be solicited or accepted.

The three chief items of either doubtful or absolutely dishonest advertisement are medical, medicinal and financial. One must wonder if the pure food laws have been strictly applied to the manufacturers of some of the vile artificial compounds and mixtures advertised as the shortest route outside the Volstead Act.

Dentists, doctors, midwives, X-ray and other alleged experts; eye, ear, throat, rupture and nervous "specialists" pre-empt valuable advertising space. One has but to stand twenty minutes at the entrance of the premises occupied by these ballyhooers to see the fervent or patient stream of primitive and ignorant humanity being bled of high fees. If professional ethics require that American specialists of the same group must not advertise, why should foreigners violate the rule? If publishing ethics preclude the carrying of medical and medicinal advertising in American newspapers, why should alien newspapers violate the rule? The Abrams cure-all fake exposed by THE DEARBORN INDEPENDENT is a mere fraction compared to the machines and machinery advertised in the foreign-language press for the exploitation of the ignorant.

"Gold teeth are a proof of prosperity," was the slogan of a foreign dentist, foreign although born in the United States, and the number of invented diseases and ailments with which hapless individuals from the immigrant classes are cajoled or browbeaten into paying submission defies calculation. Jokes are told about what the American dentist tells his more or less sophisticated patients who are able to understand him and answer back in kind, but for fairy tales exceeding in inventiveness the best traditional fables, I can commend the near-American dentist of foreign origin who plies his trade among his conationals. "The probe in my hand is dipped in a magic preparation that will—" or "This tiny drill was especially made for me on a pattern of my own invention that ought to make me a millionaire if—"

Certain newspapers carry scores of advertisements of wine and liquors, for "medicinal or sacramental use." It is not actually alcoholic beverage that is advertised in these foreign-language newspapers, but the "makin's." Some advertise the grapes and others the raisins; some sell the pressed grapes ready for fermentation; others the juice and the necessaries to convert the harmless beverage to alcoholic content; while scores purvey cataloged items of flavors, powders, extracts, colors and sugars to make any drink without alcohol. In the offing there are dealers who sell material to reclaim musty or acetic wine. Then comes the file of barrel, keg, bottle, cork, press, bottling and other paraphernalia.

Virtually all of that advertising may escape criminal prosecution by a technicality, but the fact is that the newspapers advertising that stuff, in part or as a whole, are indulging in a spirit of law disregard that warrants further study and necessary curb. The average prosecution under the Volstead Act is treated with levity, as do some American newspapers which do not believe in the one-half-of-one-per-cent law, but the foreigner, especially the one-dialect foreigner, taking the dubious advertisement and the levity together, is very apt to toast the United States in a singularly uncomplimentary and ungrateful manner. The ignorant foreigner is not to blame; his alien newspaper makes it possible for him.

Money Is the Answer

ONE might well ask why these foreign-language publishers, who claim one hundred per cent Americanism, who are hailed as the benefactors of their respective colonies, who are insistently prominent in local alien circles, do not live up to the country's ideas by adopting the customs and ethics of Americans engaged in identical work. The answer? Money. They would have to close up if they became particular—particular enough to cater to their readers primarily and their advertisers secondarily. Of course, publishing a foreign-language newspaper is no sinecure, especially financially, but if the reading public does not warrant a flashy or important-looking periodical, then temper the periodical to the reading public and not vice versa.

The existence of so huge a foreign press in the United States is not only serious but it is quite an obstruction, and the sooner it is decreased the better for the country. It begins to look now as if there will be no wholesale immigration additions to our population—certainly not for a generation—and maybe that these additions will be further restricted by more severe laws. In either case, the maximum number of alien newspapers published in this country ought to have been reached; a decrease in their number would be logical and promising.

The Germans have given us a proof of how this can be brought about; from a total of 621 newspapers in 1884 they had contracted to 244 in 1922. They started about 1,200 periodicals during that period and more than 1,500 have died. As the Germans have the largest number of readers—more than twice as many as the Italians and nearly twice as many as the Polish—the net decrease in German-language newspapers published in this country indicates not only Americanization and assimilation, but "Englishification," which makes the other two processes possible.

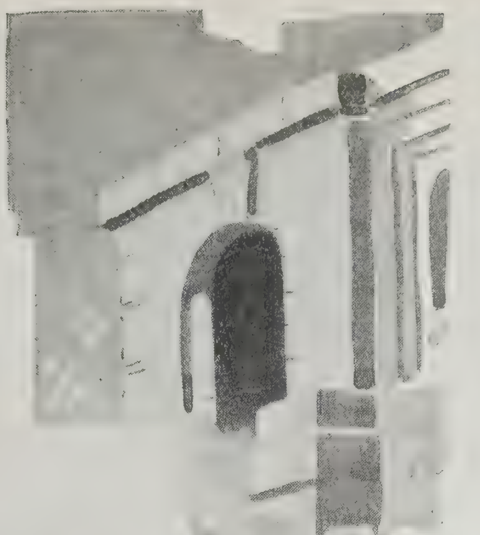
Roughly, this country today numbers alien readers as follows: German, 1,500,000; Polish, 995,000; Yiddish, 850,000; Italians, 700,000; Scandinavian, 540,000. Last year there were more than 1,100 foreign-language newspapers in this country published in thirty-nine languages or variations of same. The Jewish *Daily Forward* has the largest circulation of all alien newspapers, with 140,135, the others following: *Staats-Zeitung und Herold* (New York) German, 111,041; *Progresso Italo-Americano* (New York) Italian, 89,596; *Svenska Tribunen-Nyheter* (Chicago) Swedish, 50,672; *Ameryka-Echo* (Toledo) Polish, 42,000; *Posten og Ved Arnen* (Decorah, Iowa), Norwegian, 41,676; *Novoye Russkoye Slovo* (New York) Russian, 37,089; *Amerikai Magyar Nepszava* (New York) Hungarian, 36,214, and the *Courrier des Etats Unis* (New York) French, 30,550.

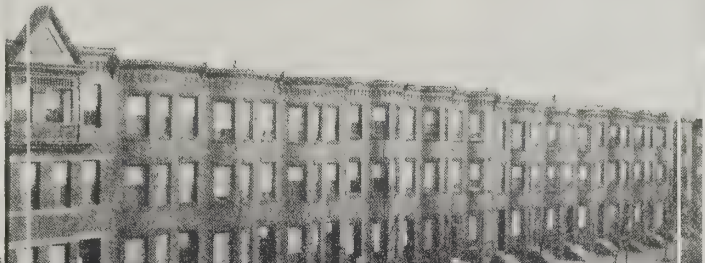
The Personality of Baltimore

Midway Between North and South

By PAUL BOWERMAN

FOREIGNERS visiting America invariably complain of the sameness of our cities and reproach us with a lack of originality. To a certain extent their criticism is obviously justified, especially in the light of the startling contrasts presented by European cities where a few hours' journey gives the traveler the opportunity to see different aspects of dress and custom and even speech. An office-building in Portland, Maine, does not differ materially from one in Portland, Oregon, although three thousand miles lie between them, and like parallels could be found in a hundred other features of the two cities.





Above—Rows of privately-owned brick houses, a type of architecture characteristic of Baltimore.

Left—Entrance to the Walters' Gallery—a fine art collection given to the city by a prominent citizen.

Right—A bit of Charles street. The monument was one of the first erected to Washington.

Below—Entrance to the Baltimore stadium.

The outward peculiarities of American cities depend chiefly upon climatic conditions, or in the case of the older cities upon historical traditions, although this second factor is almost negligible in comparison to the cities of the older European civilization. Thus Boston clings to the relics of the Puritan days; New Orleans cherishes the fast-disappearing influence of the French occupation; St. Augustine and San Diego are proud of the graceful ruins of the Spanish explorers.

When these few signal instances have been mentioned, there is little else to say. When we consider large regions of like geographical conformation, such as the Middle West, there is nothing to say. If a stranger could be dropped into the midst of Cincinnati or Minneapolis or St. Louis, he would be at a loss to know where he was. The casual passer-by, with a few hours at his disposal, would find them identical.

It is only after a stay of a month or more that the traveler begins to catch a glimpse into the inner personality of an American city. Before that time he is struck only by unimportant externals, such as some unique method of naming the streets or some novelty in billboard advertising. One notices at first glance the red-and-white gasoline stations in Detroit, the ornate luxuriousness of the theaters in Cleveland, the curiously chopped-up aspect of Pittsburgh, the apartment-houses in Washington. But these are only externals, interesting at first, but increasingly negligible as one begins to form an acquaintance with the intangible and elusive atmosphere which characterizes the city and sets it apart from the others.

In Baltimore, this atmosphere which I have been trying to discover is provokingly agile in escaping detection. In this, Baltimore is at least consistent, for the longer I remain the more I become convinced that the personality of the city is the curious propensity to hover uncertainly between two extremes, lacking the courage or disposition to take a definite stand upon either side, and wavering from one to the other with truly feminine variability. This state of affairs is more easily explained after a consideration of some of the more obvious details.

The most striking feature of Baltimore are the long rows of brick buildings, rising directly from the sidewalk, and joined wall to wall without the usual interspersion of a plot of grass, which give an air of discreetness and smug respectability to the picture, and the unbroken front of these identical façades, although necessarily monotonous, are eloquent of carefully regulated households within. Two-thirds of the inhabitants live in these curious dwellings—fifteen feet wide, three rooms deep, and three stories high. The mystery of the popularity of this style of architecture was solved when I learned that most of these blocks of houses had been erected by building corporations under a scheme whereby the occupants of each fifteen-foot slice acquired the title to his particular cranny by substantial monthly payments. Thus it is Baltimore's proud boast that over fifty per cent of the city's houses are owned by the tenants. I wondered how many were mortgage-free.

Other parts of Baltimore, closer to the business section, might furnish a motion-picture company a setting for an English film, for here are indefinite stretches of old weather-stained brick and stone houses ranged upon narrow sloping streets and permeated with the typically British atmosphere of quiet seclusion and decorous reserve. Nothing seems to have been changed there for generations—a state of affairs incredible to the inhabitant of the average American city, where the comfort-loving citizen is forced to move at least once in two years to escape the encroachments of the business section. It was this part of Baltimore that appealed to me most of all, and not entirely because it was unusual, but for the more important reason that I found myself in sympathy with the viewpoint of these old-established Baltimoreans who refuse to relinquish the traditions and standards of a culture that is everywhere giving way to a German equivalent of the word—the lately discovered *kultur,* which we fought to stamp out and promptly imitated. I could not help feeling that the people who clung to those old houses of red sandstone, generation after generation, were not the sort who had learned to spell success in capital letters, but who were the ones to whom I should most naturally turn if I wished a record of the names illustrious in the history of Baltimore.

Notwithstanding, "the old order changeth," even in this last stronghold of a passing generation, but the alteration has taken a form best suited to the atmosphere of the locality. Instead of the coming of garages and rooming-houses, which is the fate of the older quarters in most American cities, dozens of tea rooms have been opened in these faded mansions, and most of them are arranged and furnished with the same taste and refinement which one unconsciously associates with the appointment of those same houses in better days. Not that Baltimore has imitated Greenwich Village, for nothing could be further from the truth, because there is very little evidence of the bizarre and garish tone of the latter. Instead, you are more likely to find a gray-haired Negro waiter, in irreproachable linen, taking your order for waffles and tea or some Maryland delicacy, and the victrola will be stocked with records of Galli-Curci and Murator, rather than the latest novelties in jazz.

This brings up once more the peculiar disposition of the city to hover between two extremes. Baltimore is the southernmost of the northern cities, or, inversely, the northernmost of the southern cities. It has the summer climate of Tampa and the winter climate of New York—it is really endurable only in the fleeting months of spring and autumn. Its business development of late has taken the form of a rapid expansion, with the population now well over three-quarters of a million, so that there are in juxtaposition the features of a large city and a small city, with neither clearly enough defined to convince the stranger.

Blue Laws of the most stringent order are in force, and at the same time bootlegging is a comparatively safe career. Theaters and motion picture houses are closed on Sunday, and even the municipal orchestra can give Sunday concerts only by selling tickets on the preceding day; yet bookmaking on the horse races flourishes in cigar stores and public gambling is permitted on the numerous tracks that draw their patronage from the city. Incongruities of this kind could be multiplied almost indefinitely, until it would appear reasonable to assume that such were the outstanding features of the personality of Baltimore.

The situation of the city midway between the North and the South, and the additional factor of its recent commercial expansion, combine to furnish an adequate explanation of the phenomena. As far back as the Civil War, Baltimore gave evidence of this inability to maintain consistency, when Maryland voted to remain in the Union, although a slave-holding state, which decision was the occasion of an internal quarrel scarcely less bitter than the war itself. The North, with its energy and progressiveness and general intolerance of tradition, and the South, with its easy-going proclivities and aristocratic organization of society, are found side by side in Baltimore. And to all appearances, no effective and desirable co-operation is evident between the two elements, either in politics or business or social intercourse. Politics seems to be the source of continual friction, much of the large business interests is conducted by northern capital and under northern management, and society adheres to the conventions of the South. In many respects the two viewpoints are diametrically opposed, and the supporters of each seem equally convinced of the superior virtues of their particular system. It would be quite futile to take sides in the question, but at the same time that I noticed that the progressiveness of the North seemed to be gradually gaining an ascendency over the more graceful but more easy-going methods of the South, I regretted the necessity of effacing a point of view that seems to me is becoming increasingly rare and desirable in our desperate efforts to achieve the maxium in efficiency.

The contrast presented by these two points of view was strikingly brought to my attention one morning. I had spent the early half of the forenoon in exploring the labyrinth of old streets and quiet squares which never failed to delight me. For two hours I had wandered through pleasant old avenues and parks, taking pleasure in the grilled balconies and venerable façades of stone and marble, and wishing that it had been my privilege to have seen the Baltimore of fifty years ago. For I was in that section of the city, so reminiscent of the London near Portman Square, which succeeded in creating an individuality that was harmonious and consistent and pleasing. Wherever else I went in the city, either in the business section or in the outer quarters or in the many suburbs, I was confronted by the hodgepodge of a hundred types of architecture which one invariably encounters in every American city. Here I was surrounded by buildings whose variations in size and contour only served to accentuate the effect of a certain harmony of tone and feeling.

In this pleasant frame of mind I recalled an engagement with the secretary of a certain organization very prominent in the furtherance of Baltimore's commercial growth and expansion, and fifteen minutes later I was ushered into an office and greeted by a gentleman who might very well sit for the portrait of Mr. Lewis' "Babbitt." Like a flash, Baltimore faded away, and I was now in New York or Chicago or Detroit.

A "Reform" Governor Plays Machine Politics

Pinchot Administration in Pennsylvania Marked by Old-time Tactics

By WILLIAM A. M'GARRY

BACK in 1918 the people of Pennsylvania elected William C. Sproul governor. That is, the Republican organization under the shrewd direction of the late United States Senator Boies Penrose selected Sproul for the job, and the people put him into office by a vote so large that the names of his competitors for the Republican nomination, and the candidates on other tickets, are forgotten.

Nobody in Pennsylvania was under any delusions about that election—not even Sproul. It was hailed as another triumph for the rock-ribbed Republicanism of Pennsylvania, but the politicians knew better. They recognized it as the natural reaction after four years of a "reform Republican." Sproul was a regular. He was a politician, but he was practical. And he was pledged to two things of major importance to the people of the state. One was good roads, the other a thorough overhauling of the public school system, which was badly run down at the heels.

Pennsylvania, when Sproul took office, was listed as twenty-first among the states in the efficiency of its schools. When he left it stood well among the leaders in many respects, and its weaknesses were being eradicated as quickly as the best educational minds of the country could do it with the means at hand. The State Council of Education was enthusiastically co-operating with Dr. Thomas E. Finegan, Commissioner of Education, who was brought into Pennsylvania from New York by Sproul to do a job of educational engineering.

Sproul Kept Promise

SPROUL also kept his promise about good roads. Under his administration thousands of miles of highway were built in the primary and secondary systems laid out under his direction. He forgot a few other promises, and some of his political associates in office got rather careless with the people's money during the latter years of his administration. Also, Senator Penrose died, leaving the state without an outstanding Republican boss for the first time in many years. Accordingly all the little bosses began to trot out their candidates for Governor, and the reformers who had been snowed under when Sproul got the job became active again.

The people thereupon elected Gifford Pinchot Governor. It has been widely asserted that newly enfranchised women voters had more to do with it than the men. Also, the opponent finally selected by the leaders of various Republican organizations was a little too obviously "hand picked." Sproul himself had a lot to do with that, bowling out a number of likely candidates by various methods that were still in his power, until he had forced his attorney-general, George E. Alter, into the primaries. It was a trifle close, but Pinchot got the nomination.

About that time the country began to sit up and take notice and to hearken to the expert on conservation. Pinchot had been a champion of reform in Pennsylvania for years unnumbered. He was supposed to know all about politics, but he was a leader of the "no compromise" school. Up and down the state in the more or less perfunctory campaign that followed—perfunctory because the Democratic organization is in many of its units only a subsidiary of the Republican machine, swinging its controlled votes as the Republican leaders direct—up and down the state Pinchot•damned the deals of politicians, the trading in patronage, the juggling of state funds. He laid bare details of waste and extravagance, and he promised a square deal and an open deal, with strict adherence to the law and the Constitution, if he were elected Governor.

The story of how he failed in one essential particular may some day become a troublesome national problem to the Republican organization, when unity of the machine is an absolute necessity. As everybody knows, the so-called Progressive, Bull Moose or Roosevelt element is a powerful faction in the Republican party. Pinchot was one of Roosevelt's chief lieutenants. He is still lauded in Progressive Republican circles as a leader of that faction. Therefore when he acts like a practical politician he weakens the appeal of his reformer associates. They must repudiate him, or lose the following of certain conscientious citizens who cannot reconcile such acts with his statements of political ideals. Therefore the story of what happened in Pennsylvania is of national interest.

The Objection to Finegan

ONE official who came in for criticism about the time Pinchot's gubernatorial campaign was in full swing was Dr. Thomas E. Finegan. A number of educational malcontents objected to the literal interpretation he had placed on his agreement with Sproul, the agreement he had insisted on getting before he accepted the post of Commissioner of Education. Chiefly, that unwritten document provided that Dr. Finegan was to "take the public school system out of politics." He and all other educators were agreed that nothing whatever could be done in the way of reorganization until politics and politicians were eliminated from the whole system of state education, and Governor Sproul agreed to give him a free hand in that direction.

That didn't mean that Sproul was setting a precedent of large-handed political generosity. He was merely obeying the law. For the founders of Pennsylvania knew something about the baneful effects of politics, and they had made specific provision in the State Constitution that while the Governor was to have the power of naming the Superintendent of Public Instruction, the appointment was to run for the full term of four years. It was clearly and emphatically set forth that no Governor could remove such appointee except for cause, such as inefficiency or other irregularity.

At any rate, Dr. Finegan had found it necessary to tread rather heavily on the toes of many politicians during his four years under Sproul, and it must be said to the credit of the Governor that he stuck by his Superintendent. But when the campaign opened to elect Sproul's successor various attacks were launched against Dr. Finegan and his program. In these Pinchot took only a minor part; he promised to make a thorough investigation when he got into office. Occasionally he made charges relating to specific conditions that had not been remedied by Dr. Finegan. For instance, the general extravagance in the state government had rolled up huge deficits in the payment of educational expenses, and not having control of expenditures the superintendent had been unable to correct the matter. He had made some progress and he was still at work on the first essential step—the removal of all school funds from political control.

Generally speaking, however, the campaign against Finegan was conducted under cover. It never came out fully into the open, for obvious reasons. The politicians who wanted Dr. Finegan out couldn't afford to say so in public. They had to work through figureheads and to use any pretext on which they could lay their hands. Being politicians, that didn't bother them. They did the best they could. But long before the election it was evident to all concerned that they had not made out a case strong enough to justify the curtailment of the Finegan program for the public schools. If they had, there is no question but that Governor Pinchot, when he took office in January of this year, would have notified the Superintendent that he would not be reappointed when his four-year term expired. The date of that expiration was June 1.

Governor Pinchot, the apostle of reform, of clean politics, of taking politics out of the business and education of the state and everything else where it is doing harm, took no such step. But here is what he did—and it is stated in his own words to avoid any suggestion of misinterpretation. The quotation that follows is taken from a letter written June 7 by Governor Pinchot to Dr. Finegan, confirming a conversation they had had, as will be evident:

Governor Pinchot's Proposal

"MUTUAL friends who have recently talked with us both," wrote the Governor, "have led me to believe that the terms of the offer I made to you by word of mouth the other day are not entirely clear to you. Accordingly I write to say that what I desire to do is to send to the Senate for confirmation your appointment as Superintendent of Public Instruction, with the following understanding between us:

"That if, before the 15th of August next, I should become convinced, after personal study and after full consultation with the Council of Education and others concerned, that the best interests of the schools of Pennsylvania would be promoted by a change, you would retire; that August 15 will be the limit by which time my study will be completed, and that if you do not so retire your appointment will continue for the full four years.

"In view of the controlling place which the Superintendent of Public Instruction fills in the advancement of education and his close relation to the State Administration, it is necessary that the Governor shall have full personal knowledge of the policies and management of the Department of Public Instruction, and that the Superintendent and the Governor shall be in full harmony, both as to these policies and the way they are carried out. If at any time such were not the case, I realize, as I am sure you do also, that the work of the superintendent must be less effective and his services less valuable to the State.

"I regret that I have not been able, because of the immense pressure of public business arising out of the legislative session, to make much earlier the personal study for which time is desired. I intend to make this study wholly impartial, with an eye single to the good of the schools. My profound interest in the schools and school children of Pennsylvania, my strong desire and determination that the recent progress of the schools shall not be less, and my responsibility as Governor (which I cannot shift) all combine to make it necessary for me to take the time I have indicated for a personal study. I believe the interests of the schools will be conserved and promoted if you find it possible to agree with this plan, as I repeat that I earnestly hope you will."

Before the foregoing had been made public newspapers had announced substantially the terms of the proposal therein contained. The out and out Republican machine editors were inclined to laugh, but the reform newspapers which had been ardent backers of Pinchot were amazed. Some of them scurried around for legal justification for the Governor's plan—but failed to find it. Therefore, because many realized that the plan was nothing more nor less than an injection of politics into the school system, they objected. Throughout the state opinions were published by leading lawyers, authorities on the Constitutional law of the state, to the effect that any such agreement as Pinchot proposed to Dr. Finegan was clearly a violation of the Constitution. The Governor had those opinions before him, through his advisers, when he put the proposal on record in the form of the letter quoted above.

It was pointed out to Governor Pinchot that the Constitutional provision intended to keep politics out of the schools makes no distinction between machine politics and reform politics. It does not say that a reformer can violate a law to which a practical politician is to be held. But that did not prevent him from trying to get a resignation in advance from Dr. Finegan that would nullify the Constitution. By August 15 there would be nothing to interfere with any appointment the Governor might make. The appointment of a Superintendent of Public Instruction is subject to ratification by the State Senate, and even at that time it was known the Legislature would adjourn early in June, not to meet again for two years. Therefore if Pinchot wanted to name someone of his own selection not suitable to the elected representatives of the people, his choice could not be defeated until 1925.

It will be gathered from the opening sentence in the Governor's letter that Dr. Finegan did not take kindly to the proposal that he sidestep the Constitution, when it was made to him verbally. Friends have stated that he understood it fully, but could not believe the Governor really meant to go through with it. Dr. Finegan rejected it unequivocally in his talk to the Governor.

Accepts No Compromise

BUT by that time educators and reformer friends of the Governor had become aware that something must be done. They induced Dr. Finegan to withhold his formal answer for several days, hoping in the meantime to get a withdrawal of the proposal from the Governor. Dr. Finegan agreed, but only after public announcement that his position remained unchanged, and that he did not intend to enter into any agreement for a resignation in advance. When the Governor insisted on the agreement, Dr. Finegan left the office and made the following statement:

"On May 30 the Governor made me the proposal that he would appoint me to the office of Superintendent of Public Instruction for the full four-year term and send my name to the Senate for confirmation as required by the Constitution. This proposal was repeated to me in a letter containing a press statement sent me by the Governor on May 31. His proposal, however, contained the proviso that I place my resignation in his hands at the time of my appointment, to be accepted in his discretion after he had made such further investigation of the State program of education and the administration of the same as he might desire.

"The Governor predicated this extraordinary proposition on the ground that he had not yet had opportunity 'to study the public school problem and situation' sufficiently to enable him to determine what action he should take in the appointment of a superintendent. I immediately suggested to the Governor the impropriety of such an arrangement in view of the provisions of the Constitution relating to the term and the removal of the Superintendent of Public Instruction.

"During the last few days various suggestions have been made by friends of the Governor, of myself and of the schools intended to effect an agreement in this matter between the Governor and myself. The Governor has also sent me a written statement modifying his request of May 31. All of these propositions have contained proposals which were tantamount to the original proposal of the Governor. I have declined all of these propositions and have insisted from the beginning that I would accept the appointment on the condition only that it should come to me without any 'strings' or limitations whatever, and be made in accordance with the provisions of the Constitution.

Another Takes It

WITH Dr. Finegan out of the way, Governor Pinchot apparently made the same offer of an appointment with a string to it to Dr. J. George Becht, former Deputy Superintendent of Public Instruction, for after the appointment Dr. Becht said: "I told Governor Pinchot I would accept the proposition as made by him." Then the educational organization built up by Dr. Finegan in four years of hard work began to crack.

Men nationally known as educators resigned. They came to Pennsylvania because Dr. Finegan had a free hand to take the schools out of politics, and the evidence of their worth is found in the fact that all had standing offers from other states. Now they are lost to Pennsylvania.

The significance of all this nationally lies in the very fact that Pennsylvania, although recognized as the safest state in the National Republican organization, is nevertheless peculiarly sensitive to progressive outbursts. Even in Pennsylvania the people get tired of machine politics, and it is quite possible that they may tire of reform politics when they are no longer able to distinguish between the two brands.

In 1912 Penrose was still living, and the organization was much more powerful than it is today. Then there was one leader giving orders to a thoroughly disciplined army. Now there are a dozen leaders fighting. Yet in that year Roosevelt, under the banner of the Washington party and with Pinchot as an active leader, smashed the machine control.

Since then the practical politicians have been more deferential to the Progressive vote. They tried to ignore it, and got Pinchot. Now both elements are in a quandary. The regulars want to laugh at Pinchot's effort to ignore the Constitution and to say that he is no better than themselves. But that will not of necessity bring the Pinchot vote back into the Republican fold. It is far more likely to perpetuate the split, leaving the Governor and the patched-up Republican organization of the state high and dry.

Raise Memorial to This Man's Spirit

Mike Dowling Won Against Great Odds and His Fight and Success Are Commemorated

By EARL CHRISTMAS

MIKE DOWLING is going to have a memorial. The people of the state where he lived have raised $50,000 for the purpose, and the state itself has appropriated an equal sum. This $100.000 will be used to build a memorial for a private citizen, a man who held no high office in the government or commanding position in industry but who in the esteem of his fellow men stood at the very top.

The memorial won't be carved in stone or bronze. That $100,000 won't go into any towering shaft. The memorial they are building for Mike Dowling is as unusual as the man it commemorates. To appreciate its significance, you must know the remarkable story of Dowling's life.

Who, then, was Mike Dowling? What manner of man was this for whom the people of his state are to build a $100,000 memorial?

Some forty years ago, Dowling was a newsboy on the streets of Chicago. A little later, at the age of fourteen, he was making his way by herding cattle for farmers out in Minnesota. He started out on a trip to a distant farm one day and while he was on the way a blizzard swooped down upon him. Old-timers still recall the fury of that blizzard, which came down over the prairie in a driving snowstorm that swallowed up everything.

Loses Hands and Feet

CAUGHT out in the storm and unable to find shelter, Dowling wandered about for hours. Once he found a woodpile and knew a farmhouse must be near, but so terrific was the storm that he could not find his way to the house. But Dowling wasn't ready to give up. He plodded on. Finally he found a straw stack and crawled into it. There he remained. He could feel that he was freezing, but he wasn't going to do it without a fight. All through that terrible night, he fought off the numbing drowsiness that would have brought on sleep, and inevitably the loss of his fight.

With morning the storm ended, and he crawled out. He tried to get on to his feet, but he fell. He got up to try again. Finally, he reached a farmhouse a half-mile away.

The doctors came. It was necessary to amputate both feet and both hands to save his life. The legs were taken off just below the knees and the left arm just below the elbow. The right arm had not been frozen so badly. The fingers and part of the thumb on this hand were removed.

Without money or parents, Dowling faced about the most discouraging future one may imagine. He was not yet fifteen years old, and he had had almost no schooling. Still, he wasn't whipped. Stung by the expressions of pity from well-meaning friends, he determined that he would not be dependent, that he would play the rôle of a man.

He sold a few cattle to pay his doctor bills. Then one day he had to part with his dearest possession, a much-prized pony. Many years afterward he told how he cried all night after he had made the decision that the pony must be sold.

Becomes County Charge

BUT the money soon was gone. Dowling was forced to become a county charge. Though his money had given out, he was not at the end of his resources. Standing on the stumps of his legs, this boy made an unusual offer to the board of county commissioners in the county where he lived.

"If you will fix me up so I can get around, and give me a year of schooling at Carleton College, I will guarantee to take care of myself the rest of my life," he said.

It was a bold proposition, but there were two big-hearted old Norwegians on that board. They decided to give him that chance.

In that year at Carleton, Dowling dug in with all his might. He thought that if in that year he could learn how to study, he might go on alone. When the year was over, he got a place teaching a country school. He was on his way to independence.

He taught a country school for seven years, becoming later a city superintendent of schools. He painted fences and ran a skating rink during the vacations. He did all kinds of jobs. He ran a weekly newspaper. In time he got into real estate business, and eventually became the president of a bank at Olivia, Minnesota.

This is part of the Minnesota Hospital for Crippled Children, where an industrial school is to be built as a memorial to Dowling.

He was speaker of the Minnesota House of Representatives and at one time was urged as a candidate for governor. He was president of the Minnesota Bankers' Association and was active in organizing the Yellowstone Trail Association.

Dowling did everything that other men do. He drove his own automobile on long cross-country trips. He danced. He went hunting for big game. He had a fine home, with a wife and three children, and amassed enough property to provide comfortably for their future. He had nearly all the good things of life that come to any successful man.

But there was one thing he didn't have. He never admitted that he had a handicap. He used to tell his friends that he "felt sorry for a cripple," and that he "thanked God he wasn't a cripple." He never spoke about his handicap unless asked about it, and he never thought about it. Newspapers throughout the state referred to him as "Minnesota's gamest man."

A man who made artificial limbs for Dowling and who was long his close friend said: "He was always full of fun, always joking. I've done work for 20,000 cripples in my time, and I never knew another like him. He was a wonder."

Much of Dowling's boundless energies were devoted to helping others who were crippled. Miss Elizabeth McGregor, superintendent of the Minnesota Hospital for Crippled Children, gave me this further side light on his unusual career.

"Long before I ever had met Mr. Dowling, I used to hear of him," she said. "I had occasion to travel about the state a great deal in the interest of children. One day I came into a hotel in Minneapolis. The elevator boy was studying while waiting. When I inquired I found that the boy was going to night school, and that Mr. Dowling was making it possible. When he got through with his work in school, Mr. Dowling was going to get him a place in a bank, the boy said.

"That's the way he did. He would go around like that and try to interest crippled boys in getting an education and improving their lot. Usually he would encourage the lad to get a job and thus get him to earn his own way in part. When he found a boy with promise, he took especial delight in helping him, and he would get a place for him to work in some part of the state where he had acquaintances.

"Time after time I have run across boys who got their start that way through Michael Dowling. I couldn't tell you how many."

Loses Life Aiding Disabled

DOWLING'S death in 1921 was indirectly due to his efforts to help the great army of men disabled in the war. Early in 1919, he went up to Fort Snelling to talk to the disabled soldiers there. He thought it would be a good thing to tell them that their lot wasn't so bad as it might seem, that handicaps are not insurmountable. He reasoned correctly that if someone who had been through the mill should tell them about it, the men might be encouraged.

"Don't think that you are a cripple because you have lost a limb or two," he said. "It is the mind that counts. You know, there is no such thing as a cripple if the mind is all right. Don't spend your time thinking about the things that are gone and can't be brought back. Think of what you have. Keep your mind working and you can accomplish wonders."

When the little talk was over, the boys at the hospital crowded around him, eagerly asking him questions. The meeting proved such a stimulus to the disabled soldiers that soon Dowling was asked to speak in other hospitals. He made scores of talks to wounded soldiers.

Eventually the story of Dowling's work reached England, and the British Government and the Red Cross asked him to come to that country and talk to the wounded men in the hospitals there. He spent eight months in England, spreading good cheer and a new spirit of hopefulness among thousands of disabled soldiers.

For more than two years, Dowling devoted most of his time to this work. Though of rugged build, the exertions of these lecture tours told on him. Always a fighter, he would not quit, especially now when he felt that he could help so many others to become useful citizens. At length the body which, aided by a dauntless spirit, had stood up so well against big odds, gave away. He died in April, 1921, due to his overexertions.

That is the sort of man Mike Dowling was. Now, when it came to building a memorial, it didn't seem that a spirit like that could be commemorated properly in a bronze or marble statue. Anyway, his fellow citizens said no ordinary monument would do. The memorial they are building for Mike Dowling is something far more fitting than any graven image could be. It consists of a school for crippled children as an adjunct of the Minnesota Hospital for Crippled Children.

MICHAEL J. DOWLING

lost both his feet and hands when he nearly froze to death in a blizzard, but he refused to consider himself a cripple. Now his fellow citizens are building a $100,000 memorial to commemorate his great fight.

Dowling took an unusual interest in the Minnesota Hospital for Crippled Children. For many years it has been taking crippled boys and girls and making useful citizens out of them and it has been impressing upon the youngsters Dowling's own philosophy that "if you don't think you are a cripple, you are not."

Raise Funds for School

THUS, when the suggestion was made for a memorial for Dowling, his friends, with a fine sense of the appropriate, proposed that the Michael J. Dowling Memorial school be built. The Minnesota Editorial Association set out to raise $25,000, and the Minnesota Bankers' Association raised another $25,000. Many subscriptions came from school children. Crippled children at the hospital gave an entertainment and with great pride turned the proceeds over to the fund. The recent Minnesota legislature appropriated the balance of $50,000 needed.

While bodies of the crippled children are mending, the Dowling school will give the youngsters all the advantages which other children receive, and in addition special training that will enable many of them to make their own way in the world.

"It's just the kind of thing Dowling would have wished," one of his friends said. "He had a great fight to get the education that gave him his start, and he appreciated what a chance means."

Crippled children at the Minnesota Hospital now are being given training in commercial design, watch repairing, bookkeeping, shorthand and typewriting, millinery, sewing, toy making and other lines of vocational work. Frequently after leaving the hospital they find work from which they can support themselves. Building of the Dowling industrial school will make it possible to enlarge this work greatly.

"Many of our crippled children can be made self-supporting," Miss McGregor said. "A boy may have deformed feet, but he may make a good watchmaker or a good banker. Look at what Dowling did. We have a boy now who is just going out to take his place in a country bank.

Many Will Thank Dowling

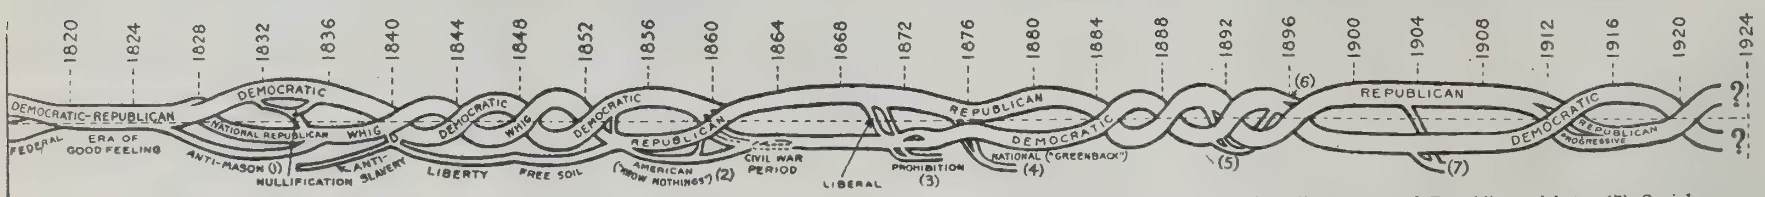
"IN DEALING with crippled children, we constantly are finding some who are unusually gifted along some line. I have in mind a girl who has an innate sense of design. With the new Dowling school, we can draw out these special talents and develop them. If there are not enough students to justify any one course, we will arrange for the child to obtain the proper instruction at another school or in the business itself. This will open up to the crippled child opportunity for training in almost any line for which he may be fitted."

The school work at the hospital now is carried on in crowded quarters in other buildings. Completion of the Dowling school will free these quarters so that more patients may be admitted. There are two hundred children in the hospital now, but there is a waiting list fully as large. The Dowling school and another building now being erected will increase the capacity to three hundred.

So, many children in the future will have reason to be thankful for Mike Dowling, who just wouldn't be a cripple.

The Ups and Downs of Party Fortunes

Twelve Times People Have Ousted Administration in Favor of Opposition



(1) Anti-Masons won seven electoral votes in 1832. In this election South Carolina cast eleven electoral votes for "Nullification" candidate. (2) Won eight electoral votes in 1856. (3) Nominated a candidate at each election since, but never won an electoral vote. National ("Greenback") Party. (4) Nominated candidates at three elections without winning an electoral vote. People's Party (Populists). (5) Won twenty-two electoral votes in 1892 but endorse Bryan in 1896. (6) National ("Gold") Democrats nominated candidates in 1896, but most of its adherents voted Republican ticket. (7) Socialists, after several lesser attempts, made first concerted effort in 1904 and have named candidates at each election since, reaching a maximum of 919,799 votes in 1920, but never winning any electoral votes. (8) Progressives carried five states and a majority of electoral votes of a sixth (eighty-eight electoral votes) and Republicans carried two states (eight electoral votes).

By HARRY PENCE

THE accompanying chart shows at a glance the ups and downs of party fortunes in this country during the last hundred years. It reveals many facts but furnishes no basis for a belief that political parties possess elements of enduring permanence. It certainly indicates that no political organization can long maintain a position of domination in national affairs.

Twelve times since 1824 this country has, by popular pluralities or electoral majorities, ousted the party in power and intrusted the opposition with the duties of government.

Since this rotation began in 1828, and especially since the organization of the Whig party late in 1834, there have always been two major parties, except during the Civil War and Reconstruction Period when Democratic strength was scattering and feeble and during the "Bull Moose" era when the Progressives supplanted the Republicans in popular esteem and polled a larger vote and a much greater representation in the electoral college.

At various times defections from one or both parties have resulted in independent movements, parties have gone to pieces and new parties have been assembled from the fragments.

There was a period—very brief—when there was no party division at all, and this was very properly called the "Era of Good Feeling," and before the issue is confused by disjointed comment let's review the outlines of party development from the beginning.

Differences at the Beginning

WHEN independence was won, wide differences of opinion existed as to what form of government should succeed the loose confederation which was universally admitted to be inadequate. Some wanted a national union in which state rights were submerged, others insisted upon a federation of states which delegated to the central government the minimum of power and authority.

This issue between the nationalists and the federalists was fought out not in elections but in the constitutional convention and the Constitution of the United States was the result. It was a compromise, but as it became, after the ninth state had ratified it in 1788, the supreme law of the land, the struggle was renewed in fights for strict or loose construction or interpretation. In one form or another this struggle still persists.

But in the matter of political parties the advocates of a stronger central government, the nationalists, took the name of Federalists and their chief, Alexander Hamilton, won over George Washington to the more moderate tenents of nationalism. Hamilton and Thomas Jefferson were both in Washington's cabinet and they represented antagonistic policies, the latter being the great exponent of states' rights.

Although a moderate Federalist, Washington's election and re-election by unanimous vote were personal tributes to his popularity. The first contest came in the choice of his successor and in this campaign, which was a bitter one, the Federalists triumphed.

The opposition, known as both Republicans and Democrats and by the Federalists termed Jacobins and other less gracious names, had not yet organized sufficiently to unite upon a candidate in the election of 1800, with the result that a Federalist House of Representatives had to choose between Thomas Jefferson and Aaron Burr, both Republicans, or as the party finally became known, Democratic-Republican. Jefferson was chosen.

The election of Thomas Jefferson was the first change in party administration in this country. It came too late, however, to save the country from the trend toward centralization to an extent greater than his party advocated. In fact, neither party was entirely successful and interpretation of the Constitution, like its formulation, was a series of compromises dictated by the emergencies which the young nation encountered in its formative years.

The old Federalist party, however, never regained ascendency. Jefferson was overwhelmingly re-elected. Madison followed him for two terms and Monroe served eight years, this span of twenty-four years being the longest period in which a political party has retained undisputed control of national administration.

The later Republican party, the G. O. P. of our day, enjoyed control from 1861 to 1885, but the election of 1876 was a popular defeat and its electoral majority on one vote, after a contest, is a political episode the beneficiaries of which prefer to forget.

Jefferson tried to avoid war with England. Madison found that to be impossible. The Federalists not only opposed the war, but sealed their political doom by trying to obstruct its conduct.

Peace with England, news of which reached this country in 1815, resulted in the complete extinction of the Federalist party and the election of Monroe, in 1816, by an electoral vote of 183 to 34. By the next election opposition had so dwindled that no nominations were made against Monroe's re-election and only the fact that one elector insisted that Washington alone was entitled to unanimous election prevented that tribute to the fifth President.

Thus was inaugurated the "Era of Good Feeling" and it must be admitted that the second administration of President Monroe accomplished much, one of its outstanding achievements being the formulation and promulgation of the famous "Monroe Doctrine," an event of which this year, 1923, is the centennial anniversary.

But the breaking down of party lines only loosened the personal animosities of four ambitious men and individual factions fought as bitterly for the succession as parties could have done. The campaign and election of 1824 resulted in the failure of any of the four to receive a majority in the electoral college. The House of Representatives chose John Quincy Adams, but a new revolution was imminent in presidential election practice. General Andrew Jackson, of Tennessee, ignored Congressional caucuses and appealed to the people for support. Till then presidential nominations had been closed affairs and in some states the legislature had chosen presidential electors. Jackson's campaign in 1824 was the beginning of the real popularization of presidential contests.

And in 1828 he defeated Adams, ousting the National Republicans, the remnants of the Democratic-Republicans, and bringing into power the party which, through all its vicissitudes, has retained the name of Democratic.

Jackson's administration was one of the stormiest in American history. Strong in popular favor, he and his party lacked able leaders in a Congress still retained by the opposition, while Clay and Webster in the Senate and John Quincy Adams in the House thwarted and provoked him on every occasion and opportunity, even to the extent of denying him support in his fight to enforce compliance with treaty obligations by France.

Jackson's re-election in 1832 was marked by a double desertion from the major parties by independents.

By 1840 the national nominating convention had supplanted other methods of placing candidates in the field. The new Whig party nominated William Henry Harrison at Harrisburg, Pennsylvania, in December, 1839, nearly a year before the election, and aroused a tremendous popular enthusiasm for the hero of "Tippecanoe." Van Buren, who was renominated by the Democrats, never appealed strongly to the people and his defeat was decisive.

It is rather remarkable that though the old Whig party attracted to its banner some of the ablest men of the day as well as some of the most astute politicians, it won but two presidential contests and in both their standard bearers were elected on their military prestige. Both Harrison and Taylor survived inauguration a short time, the former one month and the latter four, and both were succeeded in office by vice-presidents who disappointed party leaders. In both instances the following general election resulted in the return of the Democrats to power.

Policy of the Whigs

IT WAS the policy of Whig leaders to consider vote-getting as the primary requisite in its candidates, thus denying preferment to its ablest men, with the result that after the defeat of General Winfield Scott, another warrior, in 1856 aspiring men sought a new party alignment.

Conditions were rapidly favoring this development. There was one temporary and one permanent movement during this Whig era, the former being the picturesque, but short-lived "Know-Nothing" excursion. This secret society, bound by oath, opposed unrestricted immigration, easy naturalization and election of former foreigners to office. Members, when asked about the organization, were required to deny knowledge of it, hence their name. They were successful in state elections for a time but passed quietly in the stirring times which preceded the Civil War.

The other independent movement was of much less conspicuous origin, but of immensely more enduring character. As early as 1833 the National Anti-Slavery Society was organized for the purpose of popular propaganda and Congressional petition. Its active members soon became known as Abolitionists. They carried the campaign into border states and met with opposition everywhere, violence in many cities. Their first weapons were speech and print and the more fearless established papers, many of which were raided.

In 1848 factions from both parties formed the Free Soil party for political agitation and nominated a presidential candidate. While the extremists were endeavoring to achieve results by independent party action, more moderate opponents of slavery and especially of its extension into former free territory were endeavoring to induce Whig leaders to take up the issue, while the Democrats were also importuned to become the outspoken slave party.

Then, as now, the major parties refused to commit themselves on so vital an issue until the fight over the admission of Kansas and Nebraska led to a fatal split in the Whig ranks, the Anti-Nebraska men breaking from party ranks and taking the name Republican.

The Free Soilers, of course, joined the Republicans, as did also many Democratic opponents of slavery.

So completely did this sap the strength of the old Whig party that in the election of 1856 it was a negligible factor.

The swift annihilation of the Whig party was followed, in the next election, that of 1860, by the self-destruction of the old Democratic party, which found itself, in convention assembled, unable to make a satisfactory nomination. The convention wrangled and adjourned, met again and nominated, only to be countered by a bolt. A second faction nominated another candidate and the new Republican party was forced to victory by the stupidity of its opponents.

Lincoln entered upon his term of office committed not to attempt the abolition of slavery, but to oppose its extension. This difference seemed not to weigh with the slave-states, Democrat and Whig alike, for up to the actual secession a strong Whig party existed in the South. Lincoln's election, they argued, menaced the institution of slavery upon which they felt their material prosperity depended and they made matters worse by taking the fatal step themselves.

How Garfield Won

LITTLE need be said—the less the better—of the election of 1864, or, for that matter, those of 1868 and 1872. In 1876 a somewhat altered condition existed. A reaction against the rigors of reconstruction, a general desire for change, resulted in a popular plurality for Tilden against Hayes of approximately 250,000, but contests in two southern states and one western state resulted in the counting of their electoral votes for the Republican nominee, giving Hayes a majority of one in the electoral college.

In the contest of 1880 Garfield polled fewer than 1,000 votes more than Hancock and they each carried nineteen states, but Garfield won a majority in the electoral college. A glaring instance of the quick turnover of national administrations is exemplified by the three campaigns of Grover Cleveland. All of them were closely contested and in all three instances he won a plurality of the popular vote, though in 1888 Benjamin Harrison obtained a majority in the electoral college. These three elections represent a period of "even-balance" unprecedented in American politics.

In 1892 the Populists, or the People's party, advocating government ownership of railroads, income tax, postal savings banks and other then advanced reforms, put a candidate in the field and won twenty-two electoral votes. In 1896 this party joined the Democrats in endorsing Bryan and after his defeat lost its identity. Another party in 1896 also put a candidate in the field but didn't stay in the fight long enough to vote for him. When the Free Silver wing stampeded the Chicago convention and brought about the nomination of William J. Bryan the Gold Democrats bolted and held the National Democratic Convention, naming a ticket and going through the forms of a campaign. Before the election, however, leaders got to the rank and file of this faction and ordered them to play safe and vote the Republican ticket. In many precincts where the Gold Democrats had inspectors and challengers, no Palmer-Buckner votes were recorded.

The Socialists, as a third party, have for five successive elections polled a large and generally increasing vote, but so scattered that it has never carried a state in a presidential election.

The most recent and in many ways the most remarkable third party adventure was the Bull Moose movement which resulted in the bolt from the Republican party in the election of 1912.

It began with Roosevelt's effort to wrest the Republican nomination from Taft at the Republican convention in 1912 and it ended, and ended completely, in Roosevelt's refusal to accept a second Progressive nomination against Hughes in 1916. It was, therefore, a movement that revolved around an aggressive personality, but this movement reduced the Republican party to an insignificant spectacle in the election of 1912, its candidate carrying only two small states, while the Progressive polled a popular vote of more than 600,000 in excess of the regular Republican nominee and won eighty-eight electoral votes.

By 1920 this revolt had almost entirely subsided and its surviving leaders were again prominent in the party victory of that year, which only shows that the unexpected often happens and that one is much safer dealing with party history than in prognosticating party prospects.

What a Woman Does With a Check Book

A Banker Reveals How Erroneous a Certain Widespread Belief Is

By THOMAS J. MALONE

A WIDESPREAD belief among men—gleefully fostered by newspaper paragraphers and vaudeville monologists—has it that women as a class are characteristically poor at figures, are erratic mathematicians in business matters and are especially at sea in keeping a bank checking account. A little delving discloses that there is about as much truth to this belief as attaches to such other misconceptions, equally time-honored, as those attributing a relation between the phases of the moon and the weather, the last dying flirt of a snake's tail and the coming of sundown, the twitching of a forked stick and the presence of underground water. In other words, it isn't so.

Bankers themselves are authority for this flat denial, this cheering defense of womankind in its computational capacity. According to the bankers, who must be conceded basis for knowing, this allegation amounts almost to a libel. Only rarely now, it seems, do they get a telephone call from an excited woman patron asking them to stop payment on a check which she has just accidentally burned. So, too, they point out, fewer of her sex share in the simplicity of the "young lady across the way" when she approves the person who, giving to charity for its own sake and not for self advertising, signs the check, "A Friend."

As to accuracy in figuring, what boy, sent on an errand of marketing, has ever been able to short-change his mother on his return? In school, how often the girls prove to be the champion "figgerers!"

Some women are uncertain in handling checking accounts, the bankers admit, but not a surprisingly large ratio—and, then, consider that many men are, too, they add. Most women who have taken that step toward good business practice—opened a checking account at a bank—are said to know not only how to write checks properly, but how to keep their accounts balanced in accord with the balances of the bank, know both what an "overdraft" is and how to avoid making—committing, perpetrating—one.

Why, bankers will tell you, it is nothing unusual for a woman to have two separate checking accounts in her name at one time, at different banks or in one bank, and to operate them without confusion, mistake or embarrassment. Of the two accounts, one is likely to be for household expense and the other for personal investments or, maybe, personal expense.

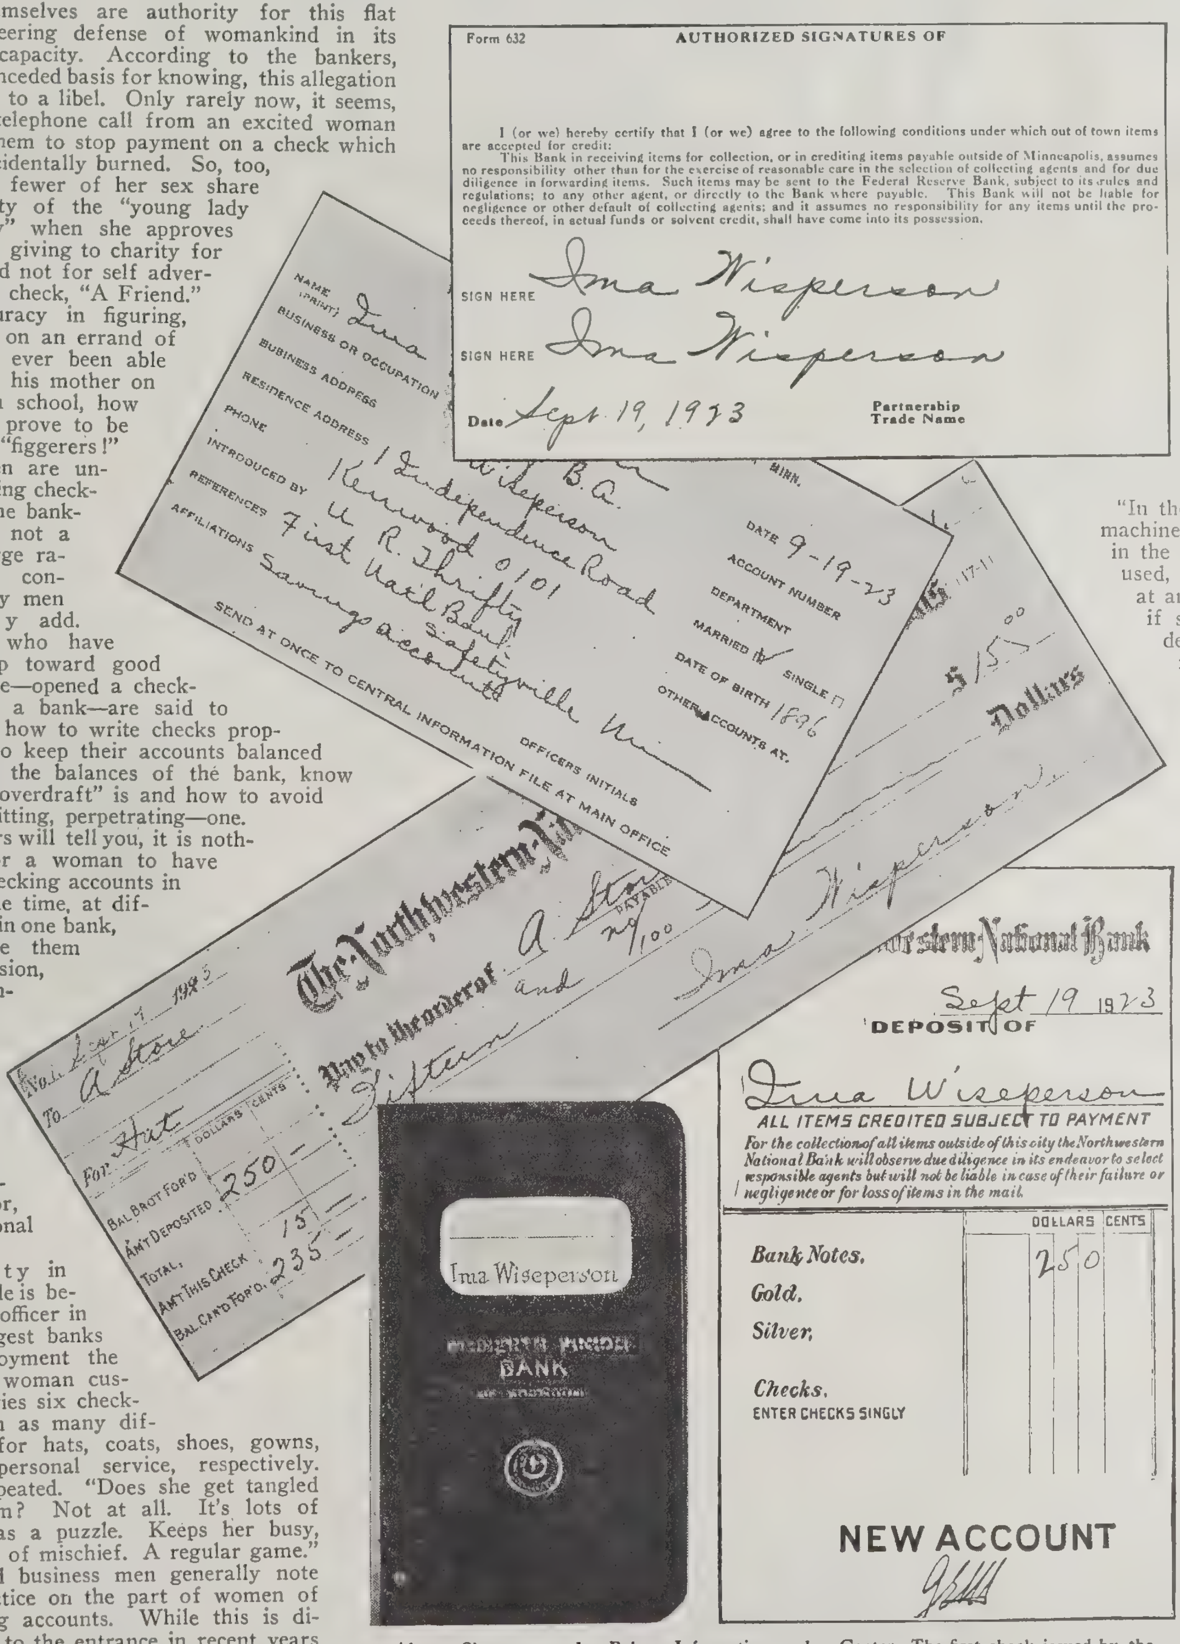
In the city in which this article is being written, an officer in one of the largest banks cites with enjoyment the the case of a woman customer who carries six checking accounts in as many different banks—for hats, coats, shoes, gowns, lingerie and personal service, respectively. "Hard?" he repeated. "Does she get tangled up among them? Not at all. It's lots of fun—as good as a puzzle. Keeps her busy, amused and out of mischief. A regular game."

Bankers and business men generally note a growing practice on the part of women of having checking accounts. While this is directly traceable to the entrance in recent years of large numbers of women into commercial and industrial life, a considerable part of the check book users is made up of housewives. This, it is explained, springs from wider recognition of the housewife's fitness to be the marketer for all the family and, as such, to have charge of part or all of the family income. The income provider does well to give her a definite allowance weekly or monthly on which to run the household—an allowance that may reach 100 per cent of income and in which her own wage-earning value may be recompensed.

There are three railroad executives in the Northwest who are known to turn in their full salaries monthly to their wives, who then deposit the amounts either in joint checking accounts or in their own names only. A "joint" account is a fascinating adventure in co-operative finance, of which more presently. If the wife deposits the full income to her individual account, then she writes checks on it in her husband's favor as he needs cash—at least, she does if she thinks it wise and his reasons good.

The other group of the happy women checksters is made up of teachers, department heads, buyers in stores, executive secretaries, women in business for themselves, and so on. The group broadens as better salaries are paid in occupations open to women.

Of late years, many banks, the country over, have made a special effort to attract women's checking accounts. They have conducted advertising campaigns emphasizing the convenience of such accounts and have established special departments, in charge of women, through which women customers may transact all their banking business if they so prefer.



Form 632 **AUTHORIZED SIGNATURES OF**

I (or we) hereby certify that I (or we) agree to the following conditions under which out of town items are accepted for credit:

This Bank in receiving items for collection, or in crediting items payable outside of Minneapolis, assumes no responsibility other than for the exercise of reasonable care in the selection of collecting agents and for due diligence in forwarding items. Such items may be sent to the Federal Reserve Bank, subject to its rules and regulations; to any other agent, or directly to the Bank where payable. This Bank will not be liable for negligence or other default of collecting agents; and it assumes no responsibility for any items until the proceeds thereof, in actual funds or solvent credit, shall have come into its possession.

NEW ACCOUNT

Above—Signature card. Below—Information card. Center—The first check issued by the new depositor with the stub filled out and retained as a record of the check. Left—Account book. Right—Deposit slip.

Even though women's checking accounts will usually average in amount less than men's, not a few banks report that they are profitable both in good will and in actual money gain. The explanation lies in the smaller overhead in handling women's accounts. To each such account, there is usually only one deposit a month and few, virtually no, out-of-town checks are received from women for deposit. Hence, less bookkeeping for the bank.

Among banks in the larger cities, it is a widely observed practice to require maintenance of a minimum balance in individual checking accounts, which are then subject to a penalty charge if the balance falls below the minimum in any month. In some cities this minimum is $100; in other cities it may run up to $500 or, in certain banks, $1,000 or even more. In the city in mind, the depositor who lets the balance get below the $100 minimum is charged a fifty-cent penalty. The assumption is that balances below $100 are not profitable to the bank, and the fifty cents is applied toward paying the bank for its expense in providing the convenience to the customer.

Banks report that a very large number of women with check accounts falls below the minimum. One result of the adoption of the minimum rule by a bank is, invariably, a decrease in the number of accounts subject to check and an increase in the number of savings accounts, which are not so subject. Women figure largely in the switch from check to savings accounts. Another important result of the rule has been the marked decrease in the number of "overdrafts," or "over drawings"—an overdraft being, in dictionary language, "the amount by which a draft exceeds the sum against which it is drawn, or a draft against a balance greater than the balance itself."

The "overdraft" subject is one around which cluster many of the standard jokes about women's banking practices. If you write and issue a check for a larger amount than you have on deposit in the bank, you have "overdrawn" the account. In some states, this is a criminal offense if done with intent to defraud. If done through miscalculation, it may be condoned; yet it becomes a serious reflection on the character of the depositor or on his intelligence.

But to what extent do women get mixed in their accounts? The head of the women's department in one of the largest banks in the city testifies that the woman who can't keep her account straight is the exception. This women's department manager is a firm believer in the value of checking accounts for women, as a help toward business exactness.

"In the absence of a cash register or an adding machine, neither of which can be carried around in the pocket, a check book," she says, "properly used, serves very well. By it a woman may tell at any time just where she stands financially—if she has made all the entries correctly for deposits and deducted all withdrawals correctly, too.

"It's just a matter of addition and subtraction; but, like keeping a diary, if you neglect jotting down a few important transactions now and then its value as a record will be impaired.

"Starting a checking account is an eye opener to the average woman. She soon learns a lot about business that she never thought of before. It's good for her. Most women know altogether too little about business matters. One of the bank's men customers, recently recovered from a serious illness, says nearness to death made him do some thinking out of the rut. When he was well enough, he began instructing his wife as to details of his business—the meaning and use of checks, drafts, notes, coupons, mortgages, trust funds, insurance. He took her to the bank, had her open a checking account and went through the contents of his safety deposit box with her so that she had some idea as to where he stood. From this on, he promises, she's going to acquire such a familiarity with business methods and practices that she won't be helpless if he's taken away."

She touches on the reason for the special departments for women conducted by banks. "Banks with such departments believe that their women customers like to receive a treatment different from that accorded men, like to be waited on by women and in a place having an atmosphere of some privacy and even exclusiveness. Yet some women, we find, don't care to do business through our department but always go to the men's windows by choice. They scorn their own sex as business transactors. In such cases, their checks, turned in to men tellers, are carried by them to our department and cared for as if handed to us at first. On the other hand, some men seem to prefer to deal at women's windows. We handle their deposits or cash their checks; then complete the transaction outside our department.

"Our work requires patience, interest in all kinds of persons, an ability to look and act pleasant under all circumstances, and a complete lack of nerves. Yes, we do have some trials with customers—women who can't keep their balances right, who fail to enter up their stubs, who never grasp the idea that the amount of the checks they write has something to do with the size of their balances, who believe a check of itself becomes money as soon as it is filled out regardless of what's behind it—but really most of our experiences are pleasant.

"Check accounts have many advantages for women. Convenience is the chief one, of course, but then such considerations also enter in as cleanliness—the avoidance of handling currency—the satisfaction of not being short of money when the pocketbook is short of bills or coin, the impulse to thrift and accuracy given by having a set method in handling one's finances, the sense of importance and independence that goes with

What a Woman Does With a Check Book

Concluded from page 11

money in the bank. A bank account of any kind contributes to self-respect. One of the major values of a checking account is that every check, after having been paid and canceled by the bank, is returned to the maker and serves as a receipt, a 'voucher' of payment, behind which no carping creditor can go."

What woman with a checking account was not surprised at the steps she took at the bank in opening it? And how many women not so equipped have a clear idea of just what those steps are? Let the manager explain them.

"Suppose Mrs. B. A. Wiseperson comes to us to open an account subject to check. She may come straight to the women's department or may make her wishes known to the first man she sees at desk or window. As a 'New Account'—we think of her in capitals—she will be referred to some officer of the bank. If she is a stranger to the bank, he will ask her to name some one known to it who will 'introduce' her—in a way, vouch for her. The introducer often accompanies the new customer, he may send a letter or the bank may call him up later to confirm his sponsorship.

"Mrs. Wiseperson proceeds to fill out a 'signature card,' a standard form, which will be kept in a file for ready reference as long as her account continues. On one side of this card she writes her 'authorized' signature—that is, the signature she will use in all checks against the account. A married woman usually uses her legal signature—her own given name, and sometimes a middle initial, before the surname, not the 'Mrs.' title with her husband's initials. But she may use the latter, if she prefers it. Mrs. Wiseperson writes her signature, 'Ima Wiseperson.' She writes it twice for good measure.

"On the other side of the card she writes her address and telephone number. The bank fills out, in addition, an 'information card,' which carries her name, business—'wife of B. A. Wiseperson'—address, telephone number, name of introducer, references and date of birth. I don't suppose that last is insisted upon, but there's a place for it on the card.

"The next step is to make a deposit. She must intrust money to the bank before she can draw out money. This means filling out one of the bank's printed deposit slips, in this case one lettered 'New Account.' At the top will go the date and her name; and then the amount to be deposited—$250, it so happens. The bank officer will put his initials on the slip. Mrs. Wiseperson hands the slip with the money to a teller in the women's department.

"Now the bank has her $250 and what has she to show for it? How may she get it out, or any part of it? The teller makes out an account book in her name, entering credit for the deposit. Future deposits will likewise be credited in this book. With it she receives a folder with a clasp, of leather or its imitation, containing a sheaf of blank checks bound together at the stub end—the 'check book' which enables the depositor to pay with credit instead of cash.

"Mrs. Wiseperson has a book in which the bank testifies that she has deposited $250 with it, subject to her withdrawal in whole or in part on her written order. She may write this order on any kind of paper—on the corner of a newspaper sheet, if she pleases—and the bank will honor it, if she dates it, addresses it to the bank and signs it; but for convenience all around she will use the check forms which the bank has given her.

"Having money in the bank and a means of drawing it out, it follows that Mrs. Wiseperson must prove herself a thorough banking woman by writing a check and finding out whether any one will accept it in lieu of money. Ah, her milliner! That darling of a hat!

"The hat costs $15. Probably with visible pride she opens that crisp new check book. It is an occasion of moment. She writes her first check—an order on her bank to pay the amount stated therein to the person named or his order. If she writes that check properly, she will take care to put the '1' of the '15' so close to the dollar mark that no space will be left for inserting another digit between them. She should form the habit. Many a check has been 'raised' in that way, the swindler at the same time altering the written number on the line below to correspond. For the same reason, she should begin her 'Fifteen' at the extreme left of the line.

"Before detaching the check, she should make out its stub which, left in the book, will be her record of the transaction. It will show her new balance in the bank against which she may write other checks. The stub will carry the number of the check, its date, the 'payee' in whose favor it is drawn, the purpose for which drawn, the total amount in the account at the time, the amount of the check and the balance to be brought forward to head the next stub.

"Her balance now reads '$235,' though on the bank's books she still is credited with $250. It may take half a day, a full day or even several days before the check she has issued reaches the bank for 'payment.' The store proprietor may deposit it in another bank, from which it may have to go through the 'clearing house' before it reaches home. If she were to make the check payable to, say, a firm in New York and mailed it out with an order for goods, it would take approximately a week for that check to get back to Minneapolis and to her bank. In any case, she should deduct the amount of the check at once; her bank deducts it when the check arrives. If she failed to enter the amount on the stub and deduct, and went on issuing other checks and failing to keep accurate stub records of them, it would not be long before she would be at outs with her bank, she claiming that she had more money on deposit than the bank's statement credited. And, goodness, how she would complain! This happens again and again, not with women depositors only, either.

"Often, however, when a depositor's stubs are accurately kept up, the balance as she makes it at a given time will be less than that of the bank. This is because she may have deducted the amount of one or more issued checks before the bank will have received them for payment. Hence it is that balances given in the bank's regular monthly statements to depositors, ready the first of each month for the month before, are frequently in excess of those depositors' stub records."

When you see a bank man, forsaking that suavity, poise and judicial mien that usually characterizes him, jump up and down and gnash his teeth with rage, it is likely that he has discovered an overdraft. An overdraft committed through innocence or ignorance may be condoned—once; but an overdraft, knowingly made, is an all but unpardonable sin in bank circles. Yes, women with check books sometimes cause the bank folk to gnash their teeth. Again the women's department manager:

"If a depositor with a balance of $125 in her account, issues checks totaling $140, she has 'overdrawn' the account by $15. One or more recipients of her checks will have them rejected by her bank with the reason stated on attached slip—'Not Sufficient Funds.' She herself will receive notice from the bank that her account is overdrawn.

"We have all smiled at the story of the woman who, having been informed by telephone from the bank that she was overdrawn, retorted with heat it could not be for she had a lot more blank checks in her book yet. And then there is that other story, equally good, of the woman who blithely assured the bank that she would write it a check to replenish an 'overdrawn' account. 'In the hole' already, she would make a check against that less than nothingness to square things up."

We promised to go back to joint checking accounts. Such accounts are kept in the names of two or more persons, jointly—usually two, as husband and wife, brother and sister, mother and daughter. Each of the two may make deposits to add to it and each may write checks against it signed by the one name only. A joint account may be a distinct convenience, but it requires co-operation to keep it straight as between the two participators. The manager has had experience with joint accounts, too, from the bank side.

"Many husbands and wives keep joint accounts," she explains, "each having, supposedly, a definitely understood share or allowance to draw upon in any given time from the joint total. This, at least, is the rule in theory, but it is much departed from in practice. If carefully kept, with accuracy and good faith, the joint plan will work well, but it is decidedly a case where the right hand must know what the left hand is doing, and vice versa.

"If either person draws upon that joint account in excess of the agreed share, without knowledge of the other, that other, in utter good faith, may overdraw the account and thus court trouble for both of them from the bank.

"Take a joint husband-and-wife account, for instance. If the husband travels, say, is away from home a good deal, trouble may result through lack of accord, of the two keeping each other informed as to what checks they are writing and what deposits making."

Are there certain mistakes fairly common among women check makers? There are. One of the most flagrant, it seems, is to sign the check with the name of the payee instead of the name of its maker. Another is to fail to sign at all. In either case, if the check reaches the bank in that form, the bank will try to identify its source through the writing. If successful, the depositor is notified and asked to come in and sign properly, or make a new check."

According to the women's department manager, depositors do unwisely if they write their names on their check book covers. If a book with such writing—the actual signature of the owner—is lost or stolen, forgery will be easy for the person into whose hands it may fall. Names should be lettered, hand-printed, in the books, not written in script. For like reason, checks should never be signed in blank—without entering name of payee and the amount—and carried around on the person. If such blank checks were to fall into the hands of the unscrupulous, they might be filled out and cashed.

For much the same reason, she counsels against making out checks payable to "Bearer" or to "Cash"—unless, in the latter case, the depositor is at the bank and is presenting the check herself. A check payable to "bearer" or "cash" is as good as money to any one who presents it for payment, if there is a balance to cover it; and the bank cannot refuse payment so long as it does not doubt the signature of the maker. Checks written in pencil are perfectly good, but they are so easily altered that it is good business practice to write checks only in ink. Canceled vouchers—checks returned by the bank after payment—as well as check books and blank checks, should not be left "lying around." The check swindler is abroad in the land, looking for just such opportunities; and he finds many of them.

The woman with a check book is said to be temperamental, to be influenced in her choice of a bank by factors other than "service" and "financial integrity."

The advertising director of a bank here insists that even the appearance of the check book issued to patrons, its size, shape, cover material, style of lettering, color of check blanks, influences women favorably or unfavorably. "A few years ago," he recalls, "one of the banks put out a pink check that made a big hit with the women. That check alone accounted for hundreds of new customers."

"A Five-cent Piece": A Dialogue Between Uncle Sam and a Banker

Concluded from page 2

of money, the workers would know as much about money and its functions as I do."

"That's just what I want," indignantly retorted Uncle Sam, "and what's more I want you and all of your kind to understand that I shall no longer continue this pseudo-partnership-business with any private individual or combination of them, under what is known as the Federal Reserve Banking Act.

"If I am rich enough, in land, coal, houses, flour, machinery, oil, copper, iron, gold, silver, healthy men and women, to make one dollar out of the quantity of nickel in twenty five-cent-pieces, why should I ever borrow from any banker or the whole of them consolidated? I own, as agent of this nation, everything in these United States, and I can take, for public purposes, anything in the United States now in the possession of any banker, worker, or any individual in the United States, natural or artificial, provided I pay these subordinate owners of property for what I take for public purposes.

"This is a simple task for me, because I am the man, and the only man, that fixes the price of the private individual's property when taken for public purposes, and I am the only man in these United States who can make the paper money or the nickel five-cent-pieces, with which to pay for the property taken. I have no reason to believe that people, in or out of the United States, do not have confidence in my ability to create valuable dollars, no matter how much some avaricious men shout at me 'rag money,' 'soft money,' 'fiat money,' 'fictitious money,' and so on. It's about time that every one should know that this nation is bigger than any of its parts and that the banking part shall no longer control my industrial blood (money), to their advantage, and to every one else's disadvantage. You, Mr. Banker, and your banking lobby shall be cleaned out of Congress, as Christ whipped the money-changers out of the temple, who were transforming it into a den of thieves. I should never be subordinate to you, or all the bankers combined; for the reason that you and all your banking institutions were created by me, and I was always taught that the creator is greater than the thing created; and I am still of that opinion."

"But, Uncle," said the banker patronizingly, "didn't I with my Federal Reserve System carry you through the World War without a panic?"

"No, you didn't. It was my $330,000 000,000 of valuable real and personal property, which I own, that was behind all the $24,000,000,000 of interest-bearing-bonds and Federal Reserve Bank Notes that you issued, or had my shortsighted public servants in Congress issue, by law. I am rich enough, in natural wealth, to issue $300,000,000 000 of non-interest bearing dollars and still have a safe margin of food, clothing, houses, machinery, and so on, amounting to $30,000,000,000 in dollars left.

"But I don't propose to make money so plentiful that it is constantly decreasing in value, and that people will find money-prices rising so rapidly, that they will, in a measure, cease producing, to go to speculating; and I don't propose to permit you to do it either; nor do I propose to permit you to reduce money-prices by reducing the supply of money. It is a bad thing for trade to have prices go up or down, as the result of a change in the supply of money, and you bankers are always tinkering with the supply of money."

"But you will ruin your credit," hotly retorted the banker.

"Credit," rejoined Uncle Sam, "is required only by the man who has not the cash to pay for his goods or who possesses no other goods to give in exchange for the goods he wants. I want no credit. Who in the United States owns more than I do? Who in this nation has the power to print his own money as I have? What is there in these United States that I cannot take by due process of law? Go and talk to some bankrupt man when you use the term credit. I don't want any credit and never did. It is only you conniving bankers that say I need credit. After you get some of the money I created by law, you have a bond-issuing scheme, under which you lend me a dollar and make me pay interest on it for generations and then you have the cheek to tell the gullible public you have given me credit, or saved my credit, by lending me one dollar and collecting four. I am the richest governmental agent in the world. I can give credit to any one, by letting him have something for a long or short time, and depending on that person to return the thing at the expiration of the time. But I have no occasion to borrow any food, clothing, shelter or money. I have now on hand more than I can consume of food, clothing or shelter and I can make all the money I need. What my people require at present is more law-made-purchasing-power and I am the man who can make any kind of a dollar my people need. I am going to create a good supply of dollars, so that producing, manufacturing and exchanging can be conducted on a cash basis and a large scale; but I shall not create enough dollars to start people into a frenzy of speculation. Go back to your marble counters and safe deposit vaults. I am tired of the stuff you pay short-sighted editors to print. I want in circulation throughout this country only a paper dollar of invariable value which will require the same average quantity of labor to get it, at all times. I don't want in my country a dishonest dollar which cheats, either the debtor or creditor, by giving either more or less purchasing-power than the agreement between the debtor and creditor originally called for."

Paving-at-cost Wins Favor of Colorado City

At Least Ten Per Cent of Million-dollar Job Saved Through Co-operation

By JACK F. LAWSON

IN ONE of the richest sections of Iowa there lives a banker who temporarily has turned paving contractor as a result of a visit to the Pikes Peak region in the summer of 1922, when he became imbued with the possibilities of the Colorado Springs plan for laying pavement at actual cost. Returning home, the Iowa banker volunteered to pave his own Main Street, the work to be done on the same basis as in Colorado Springs. It was such a success that now he is deluged with requests from near-by towns to perform the same service for them, and for information concerning the plan.

Incidentally, the originator of the paving plan, the Colorado Springs and Interurban Railway Company, the local street car utility, is besought from all quarters of the United States for data on the million-dollar paving project it recently completed for Colorado Springs at actual cost.

The eastern portion of Platte avenue, which is part of the Pikes Peak Ocean - to - Ocean Highway, is now thickly dotted with new residences where one year ago vacant lots were in the majority. Pikes Peak, with its mantle of snow, mav be seen in the background.

Looking south toward Cheyenne Mountain on Cascade avenue, Colorado Springs, one of the four principal thoroughfares included in the million-dollar paving project put down at actual cost.

Four principal thoroughfares of Colorado Springs were paved by the street car company with a two-inch asphaltic concrete surface laid on a five-inch concrete base. The city engineer estimated the cost at $1,100,000. The lowest bid for the work made by the contractors was $869,000. The street car company agreed to do the work at cost and guaranteed the cost should not exceed $864,000; and it further agreed to do such extra work as the city might require at the same guaranteed unit prices which constituted this bid. The company actually completed the work at a cost of approximately $300,000 less than its maximum guaranty. It also was provided in the contract that the cost of the paving plant and equipment to the company should be considered as part of the work, and hence the $300,000 saving was made to include the cost of the plant and equipment, which was approximately $90,000.

How the company came to bid for the contract is now interesting reading for residents of communities which are planning new paving projects and which are trying to find a way to cut down the tremendous cost attached to the usual public improvement of this nature.

The street car company is owned by the Myron Stratton Home, the holding concern for the millions left by the will of the late Winfield Scott Stratton, who amassed a fortune in the Cripple Creek gold district in the early nineties. Under the terms of the will, the Stratton estate became the property of the Myron Stratton Home, a charitable institution organized in pursuance thereof, for the support of the "worthy poor" of Colorado.

In January, 1921, the city council of Colorado Springs called for bids for approximately 295,000 square yards of paving, which is equivalent to about twenty-seven miles of standard eighteen-foot roadway. After two futile attempts to obtain reasonable bids from the contractors, the contract was let to the street car company upon the actual cost basis mentioned.

Two considerations influenced the trustees of the Myron Stratton Home in submitting a proposal to the city. It is the largest taxpayer in the city and owns two and one-half miles of double-track car line, which is included in the paving project. The trustees were naturally interested in having the work done as economically as possible, and, as public-spirited citizens, they wanted the community to derive the advantages of more paved streets. They saw a chance to save both the city and their own treasury by taking over the paving contract.

After due deliberation, the Stratton estate trustees submitted a proposal to the city council whereby the street car company offered to do the paving at actual cost, the city to acquire title to the entire paving plant and equipment after the work was finished. The city also had the right to take over the contract at any time it saw fit and complete the work itself. To comply with provisions of the city code, which call for a formal bid on all public improvements, the street car company submitted a written proposal offering to perform the work for $5,000 less than the lowest bid received from any contractor or for a sum not to exceed $864,000.

Representatives of the Stratton estate estimated there was at least $100,000 profit in the bids submitted by the contractors to the city in the early part of 1921. Even with prices remaining at the 1920-21 levels there was at least a saving of this size in sight and the prediction was made that by taking advantage of an expected drop in prices of materials, substantial savings could be effected. This was realized during the succeeding months. Through the erection of a large central mixing plant the company was enabled to economize still further. It also saved a neat little sum for the city on the enormous freight bills, being exempt as an agent for the city from war taxes.

To obtain aggregates for the concrete base and for the surfacing material, the company erected a large rock-crushing and screening plant at Victor, Colorado, in the Cripple Creek gold mining district. From the dump of the famous Vindicator gold mine. more than 70.000 tons of ore rock was ground up and used in the paving, so Colorado Springs is literally paved with gold!

The company borrowed from the local banks the money necessary to finance the project, and the interest charged was included as a part of the "actual costs" of the paving.

Under the terms of the contract the city paid to the company each month a sum equal to ninety per cent of the engineer's estimate of the work done during the preceding month on the basis of the bid price. Within less than one year of date of the contract, the company paid off all of its loans made for the purchase of equipment, materials and operating expenses from the moneys received from the city on these monthly estimates. During the last three months of the work, the company notified the city that it did not need any more money with which to do the work, and hence the city was not required to pay the ninety per cent monthly estimates for those months.

Although the contract allowed two years for completion of the paving, the company finished the job in fifteen months. It also has won the gratitude of thousands of Colorado Springs taxpayers, who, in addition to benefiting substantially by the saving of $200,000 in the cost of the paving just completed, are now the owners of a well-equipped paving plant.

To carry it out to success, the plan requires an honesty of purpose behind it. There must be no suggestion of a profit or there will be instant suspicion of the motives underlying the bid for the contract. There also must be an organization. This may be effected through the hiring of an experienced paving superintendent, as was done in Colorado Springs.

The Personality of Baltimore

Concluded from page 7

"You wish to know something about Baltimore, I understand?" said the secretary, looking over my shoulder to size up the next caller.

I nodded.

"Here you are," he said with that brisk affable smile of the successful business man.

He handed me a package of typewritten cards, and at the same time led me into an inner office where I could look at them undisturbed. It was efficiency. Here was all Baltimore on fifty cards, and only ten seconds had been wasted on me. I succumb to the temptation to reproduce the first three cards verbatim:

"Card No. 1. A TRUE BALTIMOREAN is one who believes in his city—one who talks for his city—one who spends money in his city—one whose faith in his city is so strong that he will invest his money in his city's securities.

"Card No. 2. THE ARDENT BALTIMOREAN should familiarize himself with the big salients about his city, and he will then work, talk, and fight for it. He will then spend his money here, and invest here.

"Card No. 3. WHY BALTIMORE'S SUPERIORITY. Because she possesses more of the miscellaneous elements needed for a great business center than almost any other one of her rivals. If human energy and enterprise use these to the limit, Baltimore will hum."

And so on, in like tone, throughout the fifty cards. I learned among other things that Baltimore possessed the largest spice factory in the world, and that the annual value of the manufacture of tinware was $25,000,000. I have no quarrel with the facts, nor any wish to disparage the efforts of those who interest themselves in the promotion of the city's wealth, but the idea of staid old Baltimore, with her blocks of dignified mansions and Sunday-closing laws, suddenly becoming envious of New York and Philadelphia and the booming cities of the West, appeared to me in a somewhat ludicrous light. This was the North at work—"a million or bust by 1930."

The municipal administration has accomplished two unusual things—it has built a stadium and it maintains a symphony orchestra. Although as yet incompleted, the stadium was opened last December by a football game between the Army and Navy Corps, and plans have been formulated for several important intercollegiate contests this autumn. The true significance of the project goes much further than that by creating the possibility of staging pageants on an adequate scale, of holding athletic carnivals under the civic auspices, and of furnishing a seating capacity of fifty thousand for open-air musical festivals. Plans for an elaborate entrance have been approved which will make the stadium a really magnificent affair, and plans for a large municipal auditorium to be built near by are being discussed.

The deficit incurred by the symphony orchestra each season is met by an appropriation from the city's funds, and even with this burden the per capita expenditure of the municipal administration in Baltimore is the lowest of any of the first ten cities of the country. Baltimore has taken a long step forward in thus publicly encouraging the study and appreciation of music. Symphony orchestras in other cities must either charge prohibitive prices for the concerts or be dependent upon the generosity of interested patrons.

In so general a discussion as this, it is impossible to enumerate the minor points of interest. Baltimore is the seat of Johns Hopkins University, with its unsurpassed hospital and medical college, and of Goucher College for women; the grave of Edgar Allen Poe languishes in obscurity in the midst of the city; it is quite properly known as the "City of Monuments," although in many cases the fame of the subject has not been as enduring as the image; and its good harbor is now being enlarged and improved.

What is more interesting and significant than these details is the conversion of this once Southern city into a bustling Northern city. Little by little the old sandstone mansions will give way to apartment-houses, and factories will bring their thousands of aliens. Baltimore will then have achieved success, perhaps even in capital letters, and the million mark will have been passed. The price will be the loss of the quiet dignity and the atmosphere of knowing-how-to-take-one's-ease which she inherits from her Southern antecedents. And still more important, she will have lost even the vacillating personality which she possesses at present. Baltimore will not then hover uncertainly as she does now, for she will have purchased herself a place among the stereotyped cities of the North.

Shell Mounds of Maine Scenes of Indian Feasts

Banks of Damariscotta Piled High With Oyster Shells Centuries Ago

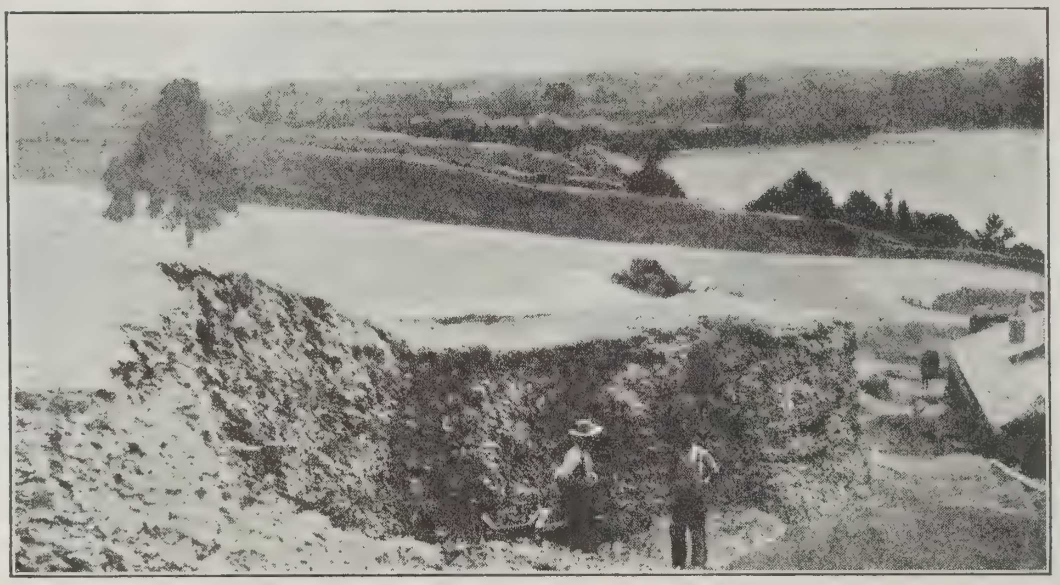
By JOHN D. ANDERSON

"Lamon, have you ever heard how the Patagonians eat oysters? They open them and throw the shells out of the window until the pile gets higher than the house, and then they move."—THE LAST STORY TOLD BY ABRAHAM LINCOLN.

POSSIBLY the great, mysteriously formed oyster shell mounds along the Damariscotta River, in Maine, originated in some such way as Carpenter declares Lincoln told Lamon the Patagonians disposed of the shells of these bivalves. Certain it is that there are giant piles of them here and some of these heaps are higher than houses. They were there long, long years, indeed centuries, before the British adventurers —Gosnold in 1602; Pring in 1603 and Waymouth in 1605—were exploring these shores. George Popham, who founded England's first New England colony at Phipsburg in 1607, was very likely the first white man to learn from the Indians of the existence of these mounds.

They lay close to the shores of the Damariscotta River. This is a short, broad tidal stream located almost midway between the Kennebec and the Penobscot. Inland fifteen miles or so from its mouth are the towns of Newcastle and Damariscotta.

It was near the mouth of this river in the pre-colonial days and as early as 1560 that fishing ships of England, Holland, France and Spain came in quest of "the Giant Cod of New England." Not a few of the masters of these vessels a little later on risked being frozen in for the long winters. From one of these ships in the early spring of 1622 the Pilgrims at Plymouth received succor. Learning of the presence there from those aboard the tender of the *Sparrow,* a vessel then anchored near Monhegan Island, that they might obtain food, a party went by order of Governor Bradford and headed by Winslow. They did obtain a supply of meal from the *Sparrow* and Winslow reported upon his return: "I found kind entertainment and good respect, with willingness to supply our wants so far as able—would not take any bills for same—did what they could freely."



The largest shell mound on the Damariscotta River.

About a mile beyond the town of Newcastle, Damariscotta, the river, takes a rather sharp bend to the westward, and a little upstream from this point a bay quite two miles long and half a mile wide is formed. The waters of a lake in the higher lands beyond here mingle with the ocean-sent waters of the river. It is along this section of the stream, both below and above the bend, that we find these oyster shell mounds—one much larger than any other in the world.

How did they get here? What is their history?

It is true, of course, that these are not the only known shell mounds, but as a group they comprise the largest number of beds and the largest group of any yet found. Denmark has a great number. There are others in British Columbia and in Japan, and likewise in Florida. Indeed there are many other shell beds in general in this part of Maine. Within ten miles of Bar Harbor there are at least fifty. An expedition of the archeology department of Phillips Academy in 1913 located large numbers near the sites of prehistoric Indian villages. By all means the largest shell heap in Maine outside of the Damariscotta region is on Boynton Point in the town of La Moine. It has been estimated that there are at least 7,000,000 clam shells in that pile. But let it be noted that the mounds along the Damariscotta are composed almost entirely of oyster shells.

Investigation has proved that none of these mounds are natural mounds. *Every shell was brought there and from a distance.* The largest mound forms a bluff along the river no less than four hundred feet in length and in places it is approximately thirty feet in height. An impression from a casual observing in sailing along the river would be that one had come upon a large riverbank sand dune.

That these mounds had their inception centuries upon centuries ago is not to be questioned. While here and there the surface shells retain even to this day their original form as they remain in the piles, a little air—the blowing of the breath upon a shell taken in hand—and lo! it becomes but white dust scattered to the four winds. Shells underneath are quite well preserved but brittle.

Many scientists have made examination of these mounds. All such are agreed that they are the remains of savage feasts and began perhaps a thousand or more years ago. In 1858 or 1859 Professor Chadbourne, of Bowdoin College, examined these shell heaps. He was the first to give them the serious attention and the thought which they well deserve. He located near by many other smaller mounds besides the giant one already mentioned. Among the shells he found the bones of birds and of beavers, and he likewise found, and seems to have been the first to make the discovery, that not all of the shells, although a vast majority, were of the oyster. Both clam and quahaug shells are to be found here, but not in any considerable numbers.

Despite the present great extent of these mounds, it is believed that they are much reduced, and that those close to the banks are very likely not more than one-half their original size. This has been due to the river's erosion.

The most logical theory as to the origin of these mounds is that they were the Indian feasting grounds. This idea is given color by the fact that arrowheads, pieces of Indian pottery, and the like, are found imbedded. No object of European manufacture has ever been discovered here.

Thus far the most thorough research given them was at the hands of the late Professor F. W. Putnam, of Peabody Museum, Cambridge. He had the assistance of Edward S. Morse and Jefferies Wyman, and their examinations were indeed exhaustive.

As one result it was found that there had been no fewer than three distinct periods consumed in their construction. This means, in other words, that there had likewise been long periods of abandonment.

Scattered through the mounds were found many evidences of their Indian origin. From a complete examination it was discovered that the bones of nearly every animal native to this Maine region had been placed here. The list included wild cat, bear, seal, mink, skunk, rabbit, deer, caribou, wolf, lynx, raccoon, otter and panther. Six more or less complete skeletons of human beings were likewise found. Some were buried with relics beside them, beads of copper and broken pottery. The skulls were broader than those of the ordinary Indian. There is some evidence, too, that those who formed these shell heaps here were cannibals.

Seventy-five Years of Joining Hearts and Hands

Concluded from page 3

Negroes had been hunted down all over the city, and when found, were shot, stoned or mercilessly beaten.

One evening several of them who had been pursued by a mob came running through Twenty-ninth street, and seeing the church door open, sought refuge there. The door had scarcely been closed when the mob reached it and began to pound upon it and demand admittance. With rare courage, Dr. Houghton threw open the door and, with his gold cross, which he always wore, held high above his head, demanded, in the name of God, that the mob disperse.

For an instant the men surged forward threatening to force an entrance. But the wiser spirit prevailed, perhaps because of admiration for the heroic figure in the doorway, and at last the mob dispersed and slunk away, leaving Dr. Houghton victor.

Dr. Houghton was always on the alert to be of service to those who needed help. In days of business depression and unemployment, he established a bread line at the church where any one needing it might receive a loaf of bread without charge. Soup kitchens were also maintained, and free clinics for those in need of medical attention but who were too poor to pay for it.

After the incident which gave the church its popular name, it became in fact an actors' church. Whenever a theatrical company came to play in New York, its members would go to the "Little Church Around the Corner." After a time, a Sunday school for the children of actors was established, in which Dr. Houghton delighted. Actors were married in the church, their children baptized there, and when the last curtain call came the burial service was read over them before the chancel.

The church soon became a popular place for the performance of the marriage ceremony. Not only were actors married there, but persons from all over the United States and from many foreign countries, chose the "Little Church Around the Corner" as the place where they should become united in wedlock. For many years more than one hundred couples a month have been married there by the rectors.

The late Dr. Houghton was the most sympathetic of men in his wish to start young couples on a life of happiness. After he had performed the ceremony he would invariably put his hand on the shoulder of the bridegroom and say to him, earnestly, "Be kind to her, my boy," and to the bride, "You must take good care of him."

Both of the rectors considered that marriage was a sacrament, a holy thing, not to be regarded lightly, and both were strictly observant of the rules of their church. They would marry no person who had not been baptized, nor a divorced person, nor a girl under age without the consent of her parents.

Many a time has a runaway couple been persuaded to return home and think it over, and counseled not to act hastily in such a momentous matter.

The "Little Church Around the Corner" is daily the mecca of many visitors, but only a small percentage of them can be classed as sightseers. The others are men and women, from every walk of life, and from every state in the Union and distant lands, who were married within the church walls, and who have returned on a loving pilgrimage to the scene of the plighting of their troth.

Some of them are childless; many with children in arms, and others by their sides; here and there a lone figure, perhaps, in mourning garb, whose life partner has been called away, but all delight to come once more to the spot which holds for them such sacred memories.

Perhaps the most dramatic incident that ever occurred at the "Little Church Around the Corner," was at the funeral of O. Henry, that writer of stories in which tears mingled intermittently with laughter, and who was himself one of the persons whose lives he sought to portray.

The funeral had been set for eleven o'clock, but through some mistake a wedding was scheduled to occur the same hour. The wedding party was to meet at the Holland House, and because of the gayety was late in arriving at the church, and the funeral cortége of O. Henry reached there first.

In consternation, those in charge of the wedding rushed to the hotel, and that there might be no shadow cast over the wedding day, told the bride-to-be that another girl had got ahead of her, and that she would have to wait until noon before the ceremony could be performed. The ruse worked, and at twelve o'clock the wedding party entered the church that had so lately been the scene of the great writer's funeral. It was not until the next day that the bride discovered that the service for O. Henry had taken precedence.

The new rector of the Church of the Transfiguration is the Rev. Dr. J. H. Randolph Ray, who comes there with a blessed heritage of memories of the performance of deeds well done, and a host of traditions which he undoubtedly will strive to uphold.

After seventy-five years, during which time many other churches in the metropolis have risen and passed away, the "Little Church Around the Corner" still stands, hemmed in by structures devoted to commerce and industry; flanked by theaters and motion picture houses where nightly thousands seek diversion and excitement after the cares of the day, and looked down upon by great hotels who daily house the population of a small city.

It stands for God, and home, and native land; for the perpetuation of a Christianity that is broader than any creed, wider than the limits of theology, and higher than the walls of doctrine; a place where crushed and bleeding humanity may find a refuge, and a hand extended to aid in time of need.

Thousands, who have been helped and comforted by the efforts of the two rectors now gone to their reward, today gladly join in the words of Joseph Jefferson, uttered that day so long ago:

"God bless the 'Little Church Around the Corner.'"

Black Walnut Offers Profitable Returns

Planted on Waste Overflow Acres, Would Yield Generous Crops

By H. R. MOSNAT

TO ADD a new commonwealth of fertile, profitable land, half the size of Illinois or Iowa, to the heart of the United States, would cause no end of interest and attention and would be worth two or three billion dollars.

Billions of dollars have been spent for irrigation in the West, and more billions for drainage in the United States, but no money has been spent to add fifteen or eighteen million acres of rich, fertile land to the Central West. This new state requires no irrigation work or dikes. It is the richest sort of land and near the masses of population. If it were all in one body it would have been discovered long ago.

But as yet it is an undiscovered country in the heart of our richest agricultural section, and so there are a score of million acres.

Black walnut trees, planted for commercial returns, would net the returns stated on the lands indicated.

Practical application of what is now being done and what can be done in horticulture is the answer to how to add so important and rich a domain; one that can easily produce crops to the value of $100 an acre and upward annually for 100 to 150 years to come.

What has been done is important, but this progress is only a hint of what can be done if a small amount of support and material encouragement is available, to do what can be accomplished with just a few thousand dollars.

Even throughout the rich Corn Belt, there are millions of acres of lands subject to floods and so of little value, because they cannot be cultivated. Illinois has about a million and a half acres of overflow land, Iowa about the same and Missouri and Indiana likewise. Ohio has more. Surrounding states will average about as much such land.

The great Corn Belt extends from Ohio to Eastern Kansas and Nebraska, and from Southern Minnesota to Central Missouri. This is almost the same as the primary commercial black walnut area. The latter does not extend as far north, especially in Iowa, but it more than makes this up by a southern lobe or extension clear across Missouri and another across Kentucky and into Central Tennessee. In this section there are about ten million acres of overflow lands.

Above—Roadside walnut trees.
Below—A train load of mixed walnut logs.

The secondary commercial black walnut area surrounds the primary on all sides. Walnut has been logged commercially in Southern Minnesota.

The black walnut has been called Liberty tree, because of its unique value. It grows wild, or once did, all over North Central United States, and has been planted in every other state in the Union. It should be our national tree.

Black walnut is the most valuable tree in the United States. Although it grows on higher lands, it flourishes on moist overflow areas, which are often very fertile silt, but cannot be cultivated because subject to floods.

The primary and secondary black walnut areas include probably about twenty-five million acres of such land. Much of this land is the natural home of the black walnut, which does not mind an occasional flood. So by planting to black walnuts, many millions of acres can be reclaimed and reforested.

Unless we intend to let our country become a desert, trees must now be planted to replace our vanished forests. If trees must be planted, why not plant the most valuable tree first? In North Central United States, at least, the most valuable tree is the black walnut.

If it must be planted, why not plant the best there is? There are named sorts of black walnuts now selected for size, quality, easy cracking, bearing qualities, and so on. These sorts are propagated the same as varieties of apples, cherries or any other fruit.

No one thinks of planting a seedling apple, pear or plum tree, unless trying to originate a new variety, because no one can tell what kind of fruit such a seedling fruit tree will produce or when.

This is just as true of nut trees, including hardy nut trees.

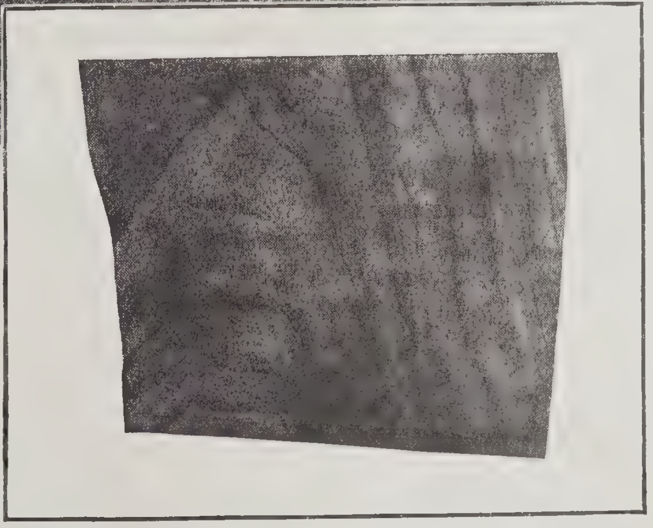
Growers of Thomas black walnuts, for instance, are now receiving $1.35 a pound for the meats. Wild black walnuts bring seven cents a pound in the shell. One bushel of nuts of named sorts of black walnuts will crack out about ten pounds of meats or kernels. That is at the rate of about $13.50 a bushel. A machine has been perfected which cracks black walnuts by power, producing seventy-five to ninety per cent half kernels.

Pecans and English walnuts are more and more being marketed in the form of meats. That is the way the large consumers such as confectioners and bakers want them. Cracking has been the greatest obstacle to the development of black walnuts.

With black walnuts there are valuable by-products. The husk is used for tanning material, stain, hair dye, and so forth. The shells make good fuel of which the ash is valuable. Or the shells can be made into the best charcoal for gas-masks.

But good as are the present named sorts of black walnuts now being propagated in a limited way, these are only selected wild nuts. They have been selected, but nature guards her varieties very carefully, and her idea of a good nut is not at all what man wants or considers a good nut for his use. Nature wants a thick, hard shell, difficult to break, to protect the seed of a new tree. Man wants a large kernel, shell easy to crack, color, quality, regular bearing.

New varieties much better than any now known can be produced by crossing species rather than varieties. The walnut family includes walnut, butternut, hickory and pignut.



Sheef of plain walnut veneer straight sliced or cut by rotary stay log process from the required side.

Grafted black walnut trees have borne seven nuts when planted only seventeen months. Propagated trees, including nut trees, bear much younger and grow much faster than seedling trees. Propagated trees often grow twice as fast as seedlings.

For bearing nuts, black walnuts are set forty feet apart, and probably fifty feet would be still better to give large, rounded tops. The trunks grow short and thick. At forty feet apart, planted diagonally, there are twenty trees to the acre. Propagated nut trees are expensive to produce, and cost more than fruit trees, but they live much longer, fewer are needed to the acre, and they require no spraying and very little pruning, and nuts do not spoil or rot like fruit. So really, nut trees are cheaper, by the acre.

A man living in East Central Iowa writes:

"Black walnut is becoming a hobby with me and I am advising young men to plant them on a commercial scale, plant them on their best land and go after the proposition on a business scale. There is no crop to which our best land can be devoted that will pay a better return for the investment."

If this is true of the best land, what about the overflow twenty-five million acres in the Central West now of small value, but where the walnut grows wild, or once did?

During the last five years the imports of edible nuts into the United States have averaged more than $47,000,000 a year. The English walnut crop of California is worth about $4,000,000 a year. Approximately $60,000,000 is invested in that industry there. The income is $100 to $300 an acre a year. The number of bearing trees has grown about ten times in the last dozen years, and it is one industry of that state that is in no danger of being overdone.

The pecan industry of the South has gone forward at least as rapidly, and named, propagated varieties were the means of that advance.

The main use, by far, for black walnuts, has always been its valuable wood, and still is. There are about 1,000 sawmills that cut black walnut, usually sawing other wood, too. The annual cut is now about sixty million board feet. In 1875 the cut was at the high tide of 125 million board feet. In 1918 approximately 100 million board feet was sawed.

On account of young trees being killed out by stock and hogs eating the nuts, black walnut is no longer reseeding. Practically no small trees are found. There are small trees a few inches in diameter, but very few smaller trees. Experts claim that the existing supply will last only twenty to thirty years, at the present rate of cut. At present about eighty-five per cent of walnut furniture is American black walnut, which is popular and expensive. A figured or "curly" grain black walnut tree is used for veneers for panels, furniture and cabinetwork. Logs of figured black walnut have realized as much as $1,200 each to the tree owner. One such tree sold wood to the amount of $3,500.

A method has been discovered by which this valuable figured black walnut can be propagated the same as a fruit tree. This is the first time that a tree has been propagated for the valuable wood instead of for the fruit or foliage. The variety has been named the Glory Figured Walnut.

When planted for timber, black walnut should be set close to make long, straight trunks. Probably a good distance is ten feet each way. In triangular planting this totals 502 trees an acre.

Authorities state that under favorable conditions black walnuts will grow as much as one inch in diameter of trunk a year. This is for seedling trees. Propagated trees will do better.

Black walnuts appreciate care, and should have attention for at least three years after planting, or until they are well established. After that they require very little attention, and at no time do they need the work that must be given to fruit trees if success with them is desired.

If an acre of hardy nut trees is worth $2,000 at the end of ten years, it will be worth eight times as much when twenty years old. It's a great deal better than a twenty-year endowment policy; the first "premium" is practically the last, and life insurance is one of the most valuable things in the world.

No one should delay planting black walnuts of the varieties now to be had. If much better sorts appear later on, trees planted now can be top-worked to the better kinds which the future will produce.

Some work along this line of producing hybridized hardy nuts has been done, but only in a very limited way because of lack of money with which to carry it on.

Thousands of dollars are being spent and have been spent for such things as to measure the heat of the sun, so that, in 1,000 years from now, a comparison can be made to show if the sun's heat is growing less. It is, of course, very scientific and interesting, but rather remote.

"Nitrogen, fats and starch can be produced to a greater amount an acre by nuts than in any other way. In these crops America has taken the lead. Lack of food is a cause for war that is readily removable by intensive agriculture," says Dr. Robert T. Morris, inventor of the modern appendicitis operation and whose avocation is experiments with hardy nut trees.

Vast sums of money are spent for many other things included in the old rhyme as

> "Not calculated to make one elated,
> Or to fill up the pocketbook—much."

A few thousand dollars for experiments in hybridizing hardy nut trees may bring forth some Mid-West Burbank whose work can immensely increase our food supply and that of our children and children's children of food of the most valuable kind. Many generations can eat nuts from the same trees, because they will bear for perhaps 150 years.

BRIEFLY TOLD

The world's fastest freight train will carry summer vacationists' automobiles between Albany and Chicago on a 42-hour schedule by the New York Central Railroad. It is expected a similar service will be inaugurated between Chicago and Denver soon.

Blowing red-hot rivets through a hose of metal is replacing the old "rivet tosser" and the boy with the "catching-can" as a means of transportation. The new apparatus is known as the "Penflex Rivet Gun" and consists of a galvanized metal tank with a connection welded to the side for the air-supply line. The discharge valve is opened by a movement of a steel rod attached to the treadle. A metal receiver with a buffer block is at the discharge end of the conveyor tube. This prevents the plastic rivet from being deformed when suddenly arrested upon reaching the end of its run.

The proprietor of a number of hotels in New York and other cities announces that he will have chapels for meditation and prayer constructed in all his hostelries. From time to time special services will be held in the chapels, but the principal purpose is to provide a place where the guests may go for quiet worship at any hour.

A Hamburg capitalist lent 10,000 marks to a baker on a mortgage several years ago. Recently the baker paid off the loan with a seven-cent cake.

Vegetable oils can be converted into gaseous and liquid hydrocarbons by subjecting the former to catalytic processes. This forms a good motor fuel with a very agreeable odor.

The master of the salt water steamship *Agga*, from Bergen, Norway, refused to accept the aid of tugs to pull his vessel off a sandbar in the harbor of Superior, Wisconsin, where she had grounded. He preferred to wait for the tide and was surprised when it did not come in.

Northwestern University has determined that class rushes in the future shall not be held among the student body.

In Brittany the family cow actually "commutes" across canals in flat-bottomed boats, morning and night, to and from the most favorable of grazing grounds.

The "zero milestone" stands just south of the White House, in Washington, on the ellipse of Potomac Park. From this milestone is measured the distance along the national highways of the United States. The stone is of white marble, and on top is a bronze sundial.

The Paris catacombs are again becoming one of the show-places of the city. The great labyrinth corridors cut from stone hold the skeletons of more than 3,000,000 persons who have died in Paris during several centuries.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Along Little Sulphur Creek, near Healdsburg, California, north of San Francisco, the ground is pock-marked for 10 miles with geyser holes. A company has dug two wells each 220 feet deep. Deeper than this their drills refused to go. An eight-inch casing was sunk in each hole to bring up the steam generated, and this was forced through 3/4-inch pipe into a steam turbine. The pressure of the steam on the 3/4-inch pipe aggregates 70 pounds to the square inch. With a five-inch vent, the pressure aggregates 30 pounds. The turbine through which the steam from the two wells is forced generates 1,500 kilowatts. An extensive power development project is being planned.

One divorce is granted in the United States every four minutes. In the last ten years the divorce rate for America has nearly doubled.

At Washington there is a "Little Cabinet" composed of the under-secretaries of the various departments of the Government. Officially it has no power and its function is to co-ordinate the departments so that they may work as a team instead of separately or antagonistically. It includes such men as Dwight W. Davis, Assistant Secretary of War; Theodore Roosevelt, Assistant Secretary of the Navy; James M. Beck, Solicitor General and A. T. Seymour, Acting Attorney-General.

High wages offered in industry is principally assigned for the steadily increasing percentage of desertions from the United States Navy. It is said that 40 members of the U. S. S. *Maryland* were missing when she left Brooklyn for her last Southern cruise. Twenty of the crew of the cruiser *Denver* failed to show up when she recently cleared from Boston for New Orleans.

A new committee, representing all classes of women, has been established in Holland to mobilize public opinion in favor of universal peace.

The Old Slave Tree in Cape Town, South Africa, is a most historic landmark, as it was there before the days of Jan van Riebeek. In the old days to this tree slaves were brought, and placed on tables for exhibition and sale. Slavery was abolished in 1838. The tree has been cut down and a brass plate giving an outline of the tree's history affixed to the stump.

A building stone for interior purposes is made from the pulp recovered from the extraction of oil from the castor bean.

Quesnay de Beaurepaire, the judge who presided over the famous Dreyfus case in France nearly a generation ago, is now an inmate of a poorhouse. He resigned from the judgeship in 1899 when a movement was started to reverse his Dreyfus decisions. By so doing he lost all claim to the government pension. Members of the Paris bar are raising a subscription fund to aid him. He is a commander of the Legion of Honor.

The largest hydroelectric power station in Finland is well under way. The total head will be utilized in four steps. When the plan is fully realized there will be available a yield of 392,000 turbine horsepower, with a possibility of increasing this to 680.000 horsepower through controlling the water level of the Salma lakes.

Eels found in rivers and creeks of the United States are hatched from eggs laid near Bermuda in the southern part of the North Atlantic Ocean.

Filling stations for fountain pens are in use on the campus of the University of Chicago. A penny in the slot operates the machine. The dropping of the coin and the turning of the handle releases ink from the reservoir, and the fluid runs into the right-hand well where it can be sucked directly into the pen or by means of the dropper provided.

In April, 1916, Congress granted a thirty-day vacation with pay to every employe, both shop and office, of the arsenals of the United States Government who had served twelve consecutive months, and this has become the standard vacation for all government employes.

CHRONICLER OF THE NEGLECTED TRUTH

Fur Ring, Linked With U.S., Threatens All Seals

International Exploiters' Record of Deals Discloses Much Politics

THE driving of the money changers from the temple was no more justifiable than is the present-day demand of loyal American citizens in and out of Congress that once and for all the ring of international Jews who are exercising an unseemly control of the government's Alaska fur-seal business and are finding ways and means of dominating a spineless Department of Commerce to a greater extent than did the former Jewish exploiters, the Liebes of San Francisco, be knocked into the proverbial cocked hat.

The payment of $81,723.85 fees to the St. Louis law firm of Spencer and Donnell, of which the partners are United States Senator Selden P. Spencer and Forrest C. Donnell, by the Fouke fur concerns of St. Louis, a part of the international fur syndicate of the associated Eitington-Schild Company and Moscow Fur Trading Company, of New York, and Chita and Vladivostok, Siberia (no house in European Russia being advertised); Mukden and Urga, Mongolia; London and Paris; Harbin and Tientsin, China; Meshed, Persia; Bombay and Constantinople and elsewhere during the eighteen months when the onslaughts of patriotic citizens were threatening the hold of this crowd on the Federal government, and Senator Spencer was doing yeoman work for his firm's client, suggests that these gentry believe in direct action in St. Louis as well as others do in Moscow.

The disgraceful results of the government permitting this group with Siberian, Chinese, Turkish and better or worse interests to retain the exclusive control of the Alaska fur-seal trade business of the government were disclosed at the recent hearings before the Senate Commerce Committee of which Senator Wesley L. Jones, of Washington, is the chairman.

The basis for this investigation was laid by Henry W. Elliott, of Cleveland, the world-famous authority upon the Alaska fur-seal, and the startling information wrung from the reluctant Department of Commerce by the combined efforts of Senators Hitchcock and Knute Nelson, the Old Viking, who bowled the protesting Spencer over. For the first time Congress and the public learned the text of these seven-year-old contracts with Fouke and the sad results.

A Failure and a Scandal

THE Alaska fur-seal business has been a government failure and scandal ever since the contracts were leased to the Liebes in 1890 for a twenty-year term. The Liebes were wise enough to let several influential persons in on the contract and thenceforth Elihu Root, the corporation lawyer, exerted himself on their behalf while he was a Senator and Secretary of State. Although the government ostensibly policed the operations, it is easy to see how a firm that possessed such friends in Washington would flout the government. Senator Nelson on a surprise visit to the islands caught the government agent winking at the killing of females. The herds, which had numbered 4,720,000, had dwindled to but 132,000 when Senators Dixon, Nelson and Hitchcock, the Campfire Club of America, Henry W. Elliott and others ended their contract despite Elihu Root's efforts on behalf of the concessionaire.

These fine citizens "had the devil's own time" getting rid of Liebes and obtaining the present seal protection treaty and the law of 1912, to quote the vigorous words of Senator Nelson.

The treaty with England, Japan and Russia established a patrol of the waters against pelagic sealing and poaching and put the entire control of sealing on the Pribiloff Islands in the hands of the United States. England and Canada insisted that the private contractor must be eliminated and the government do the work. The Jews and the department have made a scrap of paper of this intent of a solemn treaty.

The law of 1912 suspended commercial killing for five years to permit the herds to recuperate from the devastation of Liebes which included the killing of 128,470 pups. At the end of this term the Secretary of Commerce was to handle the killing and marketing. While a copyist left out a proviso that no seal under two years of age was to be killed, the department and everyone else knows of this intent, which has been studiously evaded.

The law also made it mandatory for five thousand of the finest and most perfect three-year-old male seals to be reserved each year after the end of the closed season for breeding purposes. The department has disloyally failed to do this—the contractor benefits.

The Alaska fur-seals are killed and skinned at the government stations in the Pribiloff Islands in the Bering Sea. Only male seals should be killed and the minimum age should be two years. After the male seal is five years old he grows a mane or "wig" which ruins the skin for commercial purposes. The islands' area is a closed Federal reservation. Only the native helpers, the fifteen government employes and a like number of men, whom the contractor has got on the island in violation of the spirit of the treaty, live there.

The Congressmen, the Campfire Club, Elliott and others who overcame Liebes and Root and Nagel and obtained the new arrangement, assumed the Department of Commerce would sell the sealskins it took in the raw salted condition and at auction in accordance with trade practices that had prevailed since 1826. The fact that the department did this during the interregnum of 1910 and 1911 when the Liebes were out and Congress was marking time gave these men a right to assume such.

But it seems as if you can't keep the Jews from controlling the government fur business. Philip B. Fouke succeeded in getting the fatuous Secretary Redfield, the Jonah of the Cabinet, and Assistant Secretary Sweet to make a contract, whose terms were kept secret for seven years, to dress and dye the government's skins and sell them at auction for the account of the government. He was to be paid by the piece for processing the skins and also a commission for selling them. This was unprecedented in the history of the fur business of the world.

Redfield and Sweet were persuaded that they were establishing a great industry in America. As a matter of fact, the arrangement has given Fouke and international syndicate a prestige worth millions of dollars in their efforts to dominate the fur business of the world, and the government has made a mess of things.

C. A. Freeman, nephew of Secretary Sweet and a clerk in the census office at Washington, was appointed auditor and statistician of the Fouke's concern.

In July, 1917, a supplemental contract, setting up the price of the work, was made.

The real joker in this new contract was a provision enabling the contractor to send his crews up to the islands to do the very things the government was supposed to do. The government gives these men free transportation to and from the islands and free board and lodging at the islands. This is just what the critics of the Liebes era planned to avoid by making the government do the job itself.

The percentage of cut and scarred skins increased from ten per cent and less to more than thirty-seven per cent after these men were sent up there. The government and not the contractors suffers the loss in value. Moreover the men on the islands are not going to oppose the foreman of the contractor whose political influence is known.

On June 20, 1919, the basis for the "wig" deal was made in providing, for skins forty-nine to fifty-five inches inclusive, a charge of $19 for dressing and dyeing and $20 for all more than fifty-five inches, when dressed and dyed, instead of the regular charge of $10 each. During the five-year closed season thousands of "wigs" or old bulls were developed, since any male seal that passes five years grows the mane which ruins the value of the skin.

The incompetency of the commissioner of fisheries is evidenced in the fact that he was induced to supplant the ninety-nine-year-old classification of raw salted skins in world-wide use by a new schedule based on the dressed size. Since a dressed skin can be stretched from two to twelve or more inches longer than the raw salted one, depending on the workman and the size of the raw skin, it will be seen that if the lengths of the standard salted hides are using for classifying these dressed skins, a good-sized regular skin can be classed as a wig and a $20 dressing fee obtained instead of the regular $10 charge, and the skins of yearling pups can be stretched long enough to qualify as three-year-olds. This is just what happened.

The taking of pups was bolstered up by the commissioner accepting as the raw size of three-year-old skins, the classification by a Fouke employe of a certain lot of runt survivors of some three-year-olds that had been branded on the top of the head with a red-hot iron when newly born. This test lot was branded by the agent who let the Liebes kill female seals. One of the government men who helped do this branding had certified some time before that it would kill pups and seriously if not fatally injure three-year-olds. Just imagine the result of branding any newly born animal on the top of the brain pan with a red-hot iron! Foukes foisted this runt report on the government as normal sizes and the Jewish organ of the fur trade proclaimed it a refutation of the truthful report of their friends the Liebes killing of 128,470 puppies.

Herodizing the Pups

DURING the first part of the contract few real wigs were taken; but the skins of the fine large regular seals were lengthened until the double dressing charge was paid and they were sold as wigs, obtaining the highest prices. Their size and quality were apparent TO BUYERS regardless of their NEW names.

The commissioner of fisheries solemnly announced the contractor had devised a way of converting skins that had been regarded for a hundred years as almost worthless into a condition that enabled them to top the market! Fouke modestly took credit for this achievement and the Jew fur press exuded praise.

Then the real wigs were marketed at fire-sale prices, failing in many cases to pay the $20 dressing cost and no more was heard of the wonderful wig processing. The last contract doesn't mention wigs since the job of getting $20 each for handling the accumulated wigs was concluded.

However, the last sale of May 28, 1923, shows they are Herodizing the pups through the agency of the new schedule and that test of skull-branded runt seals which makes them three-year-olds! Out of 18,118 skins sold at this auction, 10,222 would, under the standard and proper classification, have been termed "middling pups; small two-year-olds and well-grown yearlings." If these 10,222 had been permitted to live a year longer their skins would have been worth about $45 each instead of the sale price of $30. The government lost $153,000 thereby and the contractor lost nothing. The Liebes can proudly say that while their contract was buried their business souls go marching on.

The Rice Brothers Company, of London, the originators of the standard sealskin dye of the world, which Fouke in his contract undertook to use in his "American" plant, found Fouke had hired some of their experts and brought them over here (a violation of the contract labor laws) to use Rice's proprietary dyes and processes. Rice sued Fouke in the Federal Court and won his case. Thereupon experts were sent out from the United States Bureau of Standards to see about a substitute for the Rice process, which the contract demanded. They returned and made the announcement that a new formula as good as Rice's had been evolved. An independent fur man who went to the Bureau of Standards for the formula was referred to Senator Spencer.

The great value of the exclusive government contract to the Moscow Fur Trading Company—Eitington-Schild Company group is the outstanding prestige it gives them in the fur trade the world over. They advertise to trappers and other producers of furs and business men in general that the Fouke Fur Company is Uncle Sam's exclusive partner. It makes the double charges for wigs and puppy slaughtering seem like small change by comparison. Here is proof!

After obtaining the first contract Fouke consolidated his concern with the F. C. Taylor Fur Company under the new name of the National Fur Exchange, which went well with his exclusive government contract. When he failed in February, 1921, in a falling market, he had fifty million dollars' worth of skins on his hands.

Although Fouke failed upon the eve of the administration going out, he and Forrest C. Donnell, of counsel, who is also secretary of his concern, went down to Washington and got the then Secretary of Commerce, Joshua W. Alexander, who is also a Missouri lawyer, to transfer the contract to Fouke's new company for a ten-year term. No bond for the performance of the contract was required.

The new contract carried an increased rate for dressing the regular sealskins. Fouke denied before Senator Jones' committee that the new contract enabled him to make up for his alleged losses in the past. He made a statement in St. Louis to the effect that Secretary Alexander believed it no more than fair that a price should be granted that would permit the company to recoup its losses or at least make it reasonably profitable to do business with the government. No opportunity was given any one else to bid for the contract.

To impress the government and the public with his strength subsequent to his liquidation, Fouke came out and admitted his alliance with the crowd that is said to be bent on controlling the fur business of the world.

Returns Are Scanty

THE financial returns to the government of the contract have been pitiful, regardless of the bombastic and misleading utterances of the Department of Commerce. The sale by the government at auction of 12,920 raw salted skins under legitimate arrangements in 1911, a normal year, netted the government more than $280,000 after making comparative allowances. It required the sale of 35,313 skins at the October, 1922, and May, 1923 auctions, both normal periods, to net the government $260,000 under the present contract, this being the amount left for the government after the contractor's charges and kindred items had been deducted from the gross sales of $1,106,000, according to Mr. Elliott's tabulation of the government's reports of the sales.

When Senator Hitchcock introduced his resolution April 20, 1922, demanding the facts about the terms of the contract and the results of it, the resolution was referred to the Judiciary Committee, of which Senator Knute Nelson was chairman. Senator Nelson knew all the details of the Liebes era and was a leader in the effort to get rid of them, and he naturally wanted to know all about the Fouke contract.

Senator Spencer went to Senator Nelson and asked him to delay his committee's report on the resolution until he could get the former Secretary of Commerce, Mr. Nagel, who had always sided with Liebes, Root and Fouke, to explain why a report giving the text of the contracts and results of their operation should not be made public. The Old Viking paid no attention to Spencer, and reported the resolution immediately and favorably.

After examining the amazing contents of the report on his resolution containing the contracts and their results, Senator Hitchcock made a stirring denunciation of the affair on the floor of the Senate since seal protection was a personal concern of his although it meant neither votes nor retainers. It is said that Hitchcock's speech spread consternation in the Jewish fur trade interested in the Fouke bankruptcy being profitably liquidated.

Senator and Attorney Spencer attempted to debate the subject with Senator Hitchcock, and Senator Jones arose and said he was going to mobilize his committee to investigate the affair.

When the Committee on Commerce held its first hearing, Senator Spencer brought "Colonel" Fouke up to the committee room and introduced him to every one. However, Spencer was not present at the hearings when things became warm. Spencer was in constant touch with the Department of Commerce and its Bureau of Fisheries as the functionaries knew quite well. He spread assurances with a balmy air. Mr. Elliott says Spencer slurred him by referring to him as a trouble maker, an object of pity, and like terms, in spite of Elliott having the respect and confidence of the scientific world and some of the biggest men in Congress.

An enlightening example of Senator Spencer's relations with Colonel Fouke is contained in the following effusive utterance of the *Fur Trade Review*, of October, 1921:

"The best news that the fur industry has had for some time past was the announcement from Washington that on October 12 the Senate Finance Committee had

(Concluded on page 15)

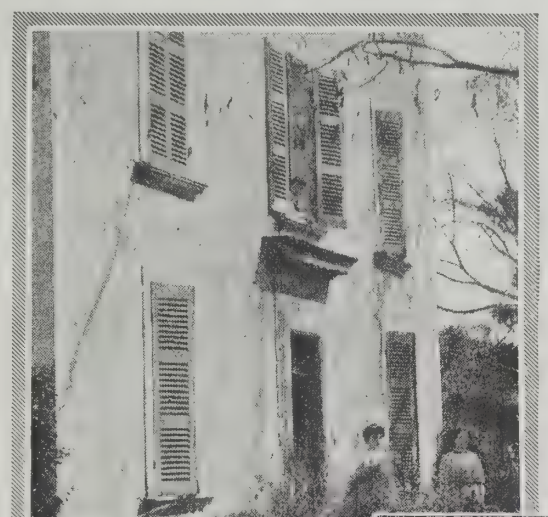
A Day's Visit to the Home of Henri Fabre

Name of Great French Scholar in Obscurity 'till Twilight of Life

By ANDREE PRATOUCY

"BAD day to go a-traveling, Mademoiselle! The mistral is rather 'on its teeth' I fear. Won't be surprised if we wake up amid vineyards or on the pebbles of the Aygues River, the two of us—and the bus on top!"

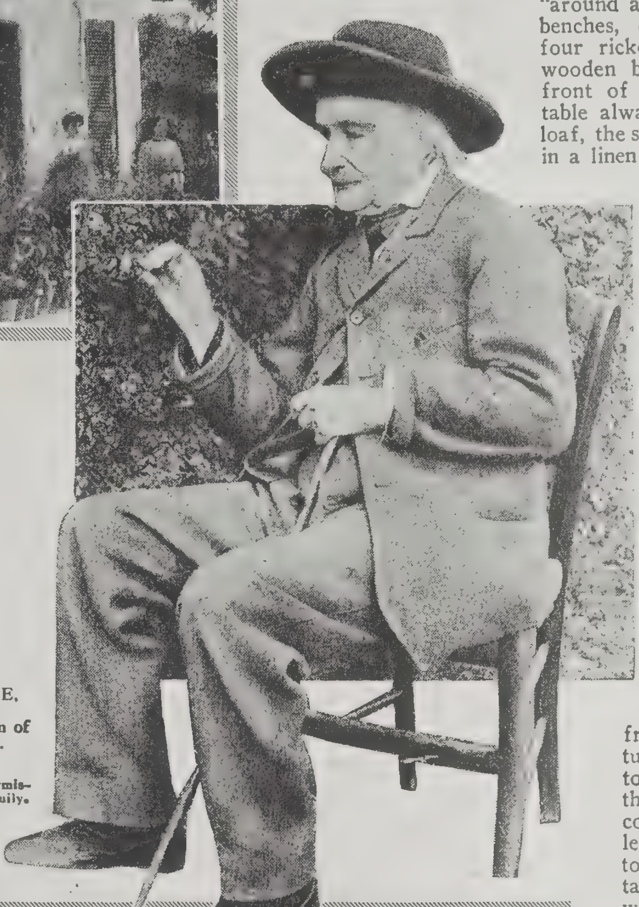
With this encouragement we started—the driver, the bus and I—from Orange, Vaucluse, to Sérignan, the far-off, carefully hidden hermitage where Jean Henri Fabre, "one of the most profound and inventive scholars, one of the purest writers, one of the finest poets of the century," the Insect's Homer, had lived, toiled and died, poor, ignored and disregarded, with the sole help of his family, the sole company of the infinitely small creatures he had made it his goal to explain, understand and love.



The home of Jean Henri Fabre.

We passed the mighty ruins of the Roman Amphitheater, of the Augustus Imperator Arch of Triumph and left Orange by a highway Caesar's soldiers had built at the time the sunny Provence was but a suburb of Rome. A bright Sunday morning perfumed with lavender and thyme, a concert of church bells, a dazzling white road swept clean by tremendous gusts of "mistral," a forest of miniature olive trees spreading their dusty green mass as far as the first mountain slope—the setting and the scenery of my pilgrimage.

Sérignan. The village is amazingly small and deserted and gray, with a flock of parched stone houses crowding their flat roofs and Roman loggias around the old church campanile, along hallow paths. A single street worthy of mention, with two rows of sycamores powdering passers-by with crumbles of their cottonous fruits. The only sign of life, a peddler's quaint carriage in front of the Café de France, peasant women in Sunday clothes bargaining for feather-brooms and frying pans, puppies barking at the tiny placid donkey half asleep in its harness.



M. FABRE,
in the garden of
his home.

Photos by permission Fabre family.

From a wee-footed little wrinkled old woman sauntering down to the fountain I got the information that "notre Fabre" (our Fabre) had spurned the village; even that was too restless for his studious meditation. His home was to be found beyond the big calvary stone cross marking the entrance of the hamlet, amid fir trees and cypresses, behind high mossy walls encircling the Harmas—the former "abandoned, barren, sun-scorched bit of land favored by thistles and by wasps and bees" which had been Fabre's forty-year dream before he could make it, for thirty years, nature's laboratory.

The village of Serignan.

For it is only toward the very twilight of his life that Fabre's name began to peep out of the obscurity which seventy years of hard work, steady observation and precious discoveries had been unable to dispel. Although ten volumes of *Souvenirs Entomologiques* had set in a unique song the revelation of a new world—the Insect's World—the public was slow to understand that the humble Harmas was sheltering a genius whose chief originality was to be self-made, facing the hardest passes of poverty with the stoic tenacity and strength of an unappalled perseverence.

It is original indeed, this life which, from the cradle to the grave, is attracted by the same aim, unfolding the same theme, devoting its energy to the study of insects or rather to the study of all nature itself through insect life. For Fabre is thoroughly convinced that the smallest pygmies hold the key to the bigger universe, that a spider can teach us more than can a star, that a dung beetle shows a deeper philosophy than Diogenes.

Mlle. Aglae Fabre.

How does he know? He himself admits that his profound love and understanding for insects does not come from heredity. Born in 1823 at Saint Léon, a Lilliputian commune in the High Rouergue, his genealogical tree has roots and branches of peasant lineage. His paternal grandparents were people of the soil, "whose quarrel with the alphabet was so great that they had never opened a book in their lives. How dumfounded grandfather would have been to learn that, in the remote future, one of his relatives would become enamored of those insignificant animals to which he had never vouchsafed a glance in his life! Had he guessed that that lunatic was myself, the scapegrace seated at the table by his side, what a smack I would have caught in the neck, what a wrathful look!

"'The idea of wasting one's time with that nonsense!' he would have thundered."

Fabre's own parents, also peasants, were so poor that Jean Henri had been placed in his grandmother's care from his early childhood. In some of the best pages of *Souvenirs Entomologiques* he vividly and humorously describes his life when, as a little urchin clad in a "soiled frieze frock flapping against his bare heels," he used to watch the flock of geese amid the dirt of the back yard. But ants and spiders and butterflies and bees were already distracting him from his official duties. To see a cricket nearer, examine its wings, try to make it sing, Jean Henri would have forgotten his plundering geese, and even the frugal supper waiting for him in the unique room of the house where he had to sit with the others "around a long table on a couple of benches, deal planks supported by four rickety legs. Each found his wooden bowl and his tin spoon in front of him. At one end of the table always stood an enormous rye loaf, the size of a cart wheel, wrapped in a linen cloth with a pleasant smell of washing, and remained there until nothing was left of it. With a vigorous stroke grandfather would cut off enough for the need of the moment, then he would divide the piece among us with the knife he alone was entitled to wield; it was now each one's business to break up his bit with his fingers and to fill his bowl as he pleased. Next came grandmother's turn. A big pot bubbled lustily and sang upon the flames on the hearthstone, exhaling an appetizing savor of bacon and turnips. Armed with a long metal ladle, grandmother would take from it, for each of us in turn, first the broth, wherein to soak the bread, and next the ration of turnips and bacon, partly fat and partly lean, filling the bowl to the top. At the other end of the table was the pitcher from which the thirsty were free to drink at will." (*Souvenirs Entomologiques*)

Then, when seven years old, Jean Henri is sent to school, if that name can be applied to such a place: dining room, sleeping room, classroom and pig stable all in one. Chickens mingle their cackles with the song of the alphabet. The schoolmaster, being a ploughman, barber, bell-ringer, choir-singer, watchmaker, is a teacher during his spare time. With him Fabre learns that Ane (ass) begins with A, Boeuf (ox) with B, Canard (duck) with C, although he does not see quite well how H can represent an Hippopotamus, K a Kamichi, Z a Zebu.

Never mind, he is soon going to see for himself those unheard-of animals in the Rodez's "Zoo." As many "ruralites" of that time, Fabre's father is tempted by the city. There, in Rodez, Jean Henri enters college where he is more a chapel choir boy than a regular student for, being just as poor as ever, he has to work to pay the tuition fees.

Rodez does not bring happiness nor money to the Fabres; nor does Toulouse. The family moves once more to Montpellier, just to suffer a more complete failure. Farewell to studies; Jean Henri has to earn his daily bread. On the road he goes, selling lemons at the Beaucaire's fair, working as a day laborer on the construction of the railroad line. But his flame for learning has not flickered with adverse fate. Making friends with grasshoppers encountered on bushes, observing the romantic dragon fly and the gaudily dressed cockchafer captured on fir tree, he rapidly wakes up to the vocation which will absorb his life.

The President

THE surprise with which some of us responded to midnight messages that the President was suddenly dead, has scarce worn off. Nothing could have been more wholly unforeseen than the sad conclusion of the Alaskan journey. Mr. Harding was not a man whom many associated with physical weakness nor any precariousness of health and it was understood by all concerned that he was recovering from the untraced cause of his last illness. But it is known now that he was a weakened man, too early weakened, and able to withstand neither the tremendous demands of the Presidency nor the attack made on his physical resistance.

No opponent of Warren G. Harding ever doubted his absolute personal honesty and sincerity. He was a straight man. Perhaps one source of his burdens was that he was too good-hearted, too easy-going. He said once, "Oh, it's easy enough to say 'no' in the big things, but it is the thousand little things that make it hard," and everyone who came to see him wanted something. He was unlike some other Presidents in that respect: other executives knew how to make use of seekers after favors, but Mr. Harding only let himself be used. It was unselfish, but it was also weak, and it added to his burden.

Part of Mr. Harding's honesty was his accurate evaluation of himself. He never posed nor pretended. He had as little "official front" as a man of natural personal dignity could well have. He had no extreme notions concerning his own ability. He said once, "Of course, I shall never be known as a great President, but I hope to be known as a sincere President." At that, he was a greater President than he thought himself to be. The pity is that he was sometimes taken advantage of by those who posed as his friends. It is significant that at the end not one of those pretended friends was with his traveling party.

Mr. Harding was greatly dispirited by the results of his journey through the West. His well-meant generalities failed to strike fire. The farther he traveled and the more he spoke the more profound became his feeling that an era was coming into existence in which he could have no part. The results in Minnesota noticeably depressed him. The feeling which he had that he should not enter the next campaign, increased within him. Perhaps his depression contributed more than will ever be known to his physical condition.

At that, no sorrow need be felt for the man, Warren G. Harding. He had reached the summit of successful experience. He had exemplified in his career the marvelous opportunities inherent in our American life. Without great gifts, he had moved steadily to the highest honor in the gift of the nation. What remained for him more, except possible humiliation and disappointment? In his death he continued that good fortune which followed him all his life. History will bracket him beside McKinley.

The sympathy and admiration of the entire American people have been given without stint to Mrs. Harding whom, with Mr. Harding, we had all come to think of as belonging to all of us.

Goes Ahead Slowly

ONE of man's friends is eternally inarticulate. But the silent eloquence of the tree will live through generations when the bombast of politicians is no more.

Poet and peasant may revel in the maple's shade. The music of the wind sighing through the branches of the majestic elm is something no manager may price. The architecture of the great oak is sublime.

You will meet no man, worthy to be called the name, who will not agree with the wisdom of preserving trees for posterity. The beauty of the streets of the cities where shade trees still line the walks is beyond description. Scientist and farmer agree that untold riches for all generations will be stored up if the nation possesses but the wisdom to reforest the country upon wise and proper lines. Everyone agrees that the preservation of the trees we still possess and the establishment of new forests are matters of prime importance.

But, despite the recognition of this fact, little is done. Agitation for reforestation has accomplished almost nothing, when one considers the vast acres which were denuded of their rich forests by the hand of the lumberman or the disaster of fire.

This lack of action on the part of the nation can be viewed as nothing less than a calamity. For men of this generation to decline to take measures to create new wealth for the next generation and to preserve such permanent riches as should belong to all generations is inexcusable.

Perhaps, it is the very lack of controversy over the necessity of reforestation which prevents the country from doing its duty. Politicians control the machinery of Government. And politicians, notably, react more quickly to controversial subjects than to great problems over which the public mind is settled.

The country always has plenty and to spare of tariff legislation. It hears orators discuss currency reform, so-called, at regular intervals. When currency debates wax warm, the imminence of currency legislation, wise or foolish, grows. In recent years, the air was filled with controversy over the needs of the farmer. And the politician replied by passing much legislation.

But forestation, unaminously approved, goes ahead slowly. Man wastes his oratory on glittering economic theories, and he remains practically unmoved to the material wisdom of perfecting the machinery of reforestation, even though he may agree that the achievement of this policy would do more for the permanent wealth of the country than a ton of economic laws of the type legislative bodies grind out at each session.

Make the Theory Fit the Facts

GOV. LEE M. RUSSELL, of Mississippi, recently pardoned a prisoner who was serving a life term, giving as the reason of his action the fact that the defendant had not been represented by a good lawyer in his trial.

The governor's action directs attention to a source of frequent injustice in American criminal courts. The theory of the law is that the prosecuting attorney, representing the state or persons in a trial, will see that fairness and justice are accorded to the defendant.

It is almost impossible that this theory be made a fact. Some district attorneys are eager to obtain a good record of convictions. Others, probably inspired by motives of fairness, find that their study of the prosecuting officer's side of the case accentuates the points of evidence which would tend toward conviction, while their view of the facts which favor the accused is always a suspicious one.

It is the practice in American courts to appoint an attorney to defend any person accused of crime, whose means does not permit him to retain a lawyer.

In nearly all courts this practice results detrimentally to the accused. It is obvious that court fees in such cases will seldom compare in size with the fees which an able trial lawyer may procure in private practice. The monopoly of this sort of business therefore gravitates to the poorer class of lawyers. Many men, just out of law school and just licensed to practice, find the defense of accused men a method whereby they may tide themselves over the clientless days of early practice, and procure practical experience in their profession. Their experience is sometimes obtained at the cost of a client's liberty.

In some states, the office of public defender has been created with the object of granting to the accused in a criminal trial, just as able and experienced counsel as represents the prosecuting side of the case. The workings of the public defender experiment will be watched with close attention by the entire country. Until its success is thoroughly established, trial courts should exercise the closest of scrutiny of criminal trials, in which the defendant is unable to hire a good lawyer. Efforts should be made to induce the best lawyers in each community to take their turns in appearing as counsel for indigent defendants. The theory of the law is that prosecuting officer and lawyer for the defense should stand equal before the bar of justice. Bench and bar of the country should make it their business to see that this fine theory is made a fact.

A Law Worth While

GOOD business nowadays, as always, requires good faith. Billions of dollars' worth of business each year depends simply on the trust of someone in someone else. Only in recent years, has the name on the dotted line become a necessary adjunct to the word of mouth.

But there are a few persons, though their number increases, whose word does not sell at par in the world. For those who are untrustworthy in great or small things, commercial laws have come into being.

There is a law in England which might well engage the attention of the states of this country. It is a law made necessary by the growing tendency of certain persons to capitalize another's good name. The law, known as *The Business Names' Act of England,* reads as follows:

> "Every trade catalog, every trade circular, show card or business letter, in which the business name appears, and which is sent to any person in His Majesty's Dominions must show—
>
> "1. The surname and Christian name (or initials thereof) of the proprietor or each partner;
>
> "2. Any former surname or Christian (or initials thereof) borne by such persons.
>
> "3. The nationality of the proprietors or partners.
>
> "4. The original nationality of the proprietors or any partners if the present nationality is not the original nationality."

The act concludes with a penalty clause.

There are many persons who deal with a concern, for the first time, solely on its name. The capitalization of a good name by those who had no share in making it good should be permitted, only after safeguarding to the public its right to know just with whom it does business.

The New President

JOHN CALVIN COOLIDGE is made by fate the thirtieth President of the United States. His term has less than two years to run. Upon assuming office he declared his intention of following the Harding policies. It is no easy succession to which Mr. Coolidge has come, the Presidency being at best a most difficult post, but the character of Mr. Harding's service was such as a man of Mr. Coolidge's temperament can follow. The country will expect no great deeds from him, and his history would seem to make it certain that he will commit no serious mistakes. And that, in these times, is a certainty worth having.

Where Credit Is Due

HIDDEN away in various departmental buildings at Washington are hundreds of obscure men whose expert knowledge and experience make them invaluable to the people of the United States. Some are clerks who know just the way to carry on Government business. Some are brilliant scientists, whose services private corporations would pay high to get. They are men who know their jobs.

And most of them, nearly all in fact, are ill-paid. Occasionally when a cabinet officer or an assistant secretary resigns, the country shakes its head sorrowfully and regrets momentarily the fact that the Government does not pay salaries high enough to command the services of able men for whom rich corporations are constantly bidding. Generally when this regret is expressed, the fact is that the country has lost only a figurehead so far as departmental business is concerned.

Cabinet officers are good things to have when counsel is desired by a President who will take advice. But so far as the running of their departments is concerned, the country does not miss them when they feel called upon to visit Europe, Alaska or go fishing. Departmental business goes on just the same.

Obscure men do the work. The Secretary signs the papers others have prepared.

And when those obscure men are forced out of Government service because they can no longer live on meager salaries, the country seldom hears of their departure, although departmental business may be disrupted for days and weeks by some $2,000 clerk's resignation.

The continued service of loyal and capable men who are the really important cogs in the machine of government is vital to the country's welfare. Politicians are too busy rewarding their faithful followers with sinecures, to remember that it is important that the men who run the government be kept well fed. Sometime a business administration will realize that obscure employes of the United States should and must be well paid.

Mr. Ford's Page

THESE are days when occurrences of almost every kind come suddenly and unexpectedly. The rate at which changes occur has been speeded up. Accumulated backgrounds and experience make it possible to achieve in five years the same results which required the last century for their appearance. The most useless of all mental labor is to forecast the future as if it were to be a mere continued resemblance of the present. It will be still more different from the present than the present is from the past. Ideas ripen faster and come in greater variety; new ways become existent today in less time than it formerly required the mind to become accustomed to the mere idea of new ways.

One month a President goes out on a tour of inspection of the United States and the next month he comes back in a funeral train. As a result many situations change. The problems that were problems a month ago are no longer problems. The whole outlook for the future changes in certain important aspects. Personalities which obtruded themselves on any forecast which could be made, suddenly cease to be factors. In an incredibly brief period and with startling unexpectedness life tips to a new angle and by virtue of the public shock certain phases of our national existence become clearer.

THE great service of Mr. Harding was to give the nation a quiet period for thought. He was not a noisy President. He did not regard himself as a national entertainer. He did not divert the public mind from its own thoughts to his thoughts. He refused to break the spell of public thoughtfulness by calling a special session of Congress. He had a horror of what he called "undeveloped idealism," by which he meant fine words that were never realized in fine actions. He did not feel called to do great acts but to prevent small wrong acts being accomplished. In this he showed one of the qualities of a great executive—When there was nothing to do, he did nothing. When the value of that kind of wisdom is recognized, Warren G. Harding will have the credit which is his due.

The passing of Mr. Harding indicates the passing of a stage of preparation for a new attitude toward public problems. The praise that has been bestowed upon his name and career is not the polite perfunctory conventionalities required for an exalted personage. Even the strongest of his critics recognize today that Mr. Harding performed a timely duty for the nation, and that to have done differently than he did would have been to meddle with things that were not yet ready for handling.

It is clear to all observers that the mind of the nation is clearer now about many things than it has been at any time since Abraham Lincoln. Doubtless the people thought they were clear about matters when they were listening to the rugged denunciations of Theodore Roosevelt or to the refined idealism of Woodrow Wilson. But they were only clear about what these men were saying. It was Roosevelt or Wilson thinking, it was not the people thinking.

Mr. Harding may have been a good party man—even too much of a party man—but there was one thing he saw clearly; he saw that there had been too much of what he called "undeveloped idealism," and that it was not his business to add to the quantity. It was a remarkably able observation for him to make, because he was somewhat inclined toward verbal idealism himself. He could have been a preacher, because he appreciated generalities of a moral kind. In his last series of speeches he gave way to his native tendency in an extraordinary degree.

Nevertheless, he saw truly in this respect. He sensed a desire in the public mind to get down to specific cases and genuine schedules for work. Oratory, however lovely and exalted, was not getting us anywhere. What has become of Mr. Roosevelt's trust-busting word flinging? It ended in his going back to the trust makers. What has become of Mr. Wilson's high idealism, an idealism so beautiful that the nations of the earth worshiped him as a new messiah? Versailles and the new world tangle came out of that. All this Warren G. Harding saw, and though he did not publicly announce it, he was not slow to do so privately.

This, it would seem, entitles Mr. Harding to the credit of having possessed a great fund of common sense. Just to see that the country was "fed up" on that sort of thing and just to resolve that he would not further impose upon the people, indicates a nature both wise and humble. Mr. Harding was a humble man, not a self-deprecating man and not devoid of natural dignity, but his estimate of himself was very conservative.

Yet with all his true vision of the impracticality of this "undeveloped idealism," as he called it, he did not regard himself as the opposite extreme, a very practical man called to do a great number of things in practical fashion. He was not, in the sense of being a master of detail, a practical man. How much positive executive ability he had, in the larger affairs, will never be known, although it must be said that he was a successful manager of his personal affairs. But as to negative executive ability, he clearly possessed that. That is to say, he showed his executive ability in this: when there was nothing to do, he did nothing.

Had Mr. Harding felt called upon to begin an active countermovement to the idealistic movement which preceded his Administration, there is no telling what condition the country would be in today. But here again his native wisdom showed itself. He clearly saw that his work was not to be one or the other; he saw that he was to be a bridge between them, a middle period, in which the country could pass without jolt or violence into another phase. And he rendered that middle service not only of necessity and because his limitations fitted it, but also of choice. He knew that he was not capable of doing certain things, and he came deliberately to the conclusion that if those things had been required for the Nation's good, the Providence which guides the Republic would have chosen a man who could do them: his conclusion was that his best service to the country, his destined service, was to insure a period when none of those things should be done, when the people should have a breathing spell, a time to do their own thinking and make up their own minds.

It is worth while considering the fact that because of this freedom from irritating activity at Washington, the people have had time to think. There is a sense in which Washington gets into the people's light. There is a sense in which a continuous legislative performance, with its political trickery and false arguments, prevents the normal exercise of the people's mind. There are statesmen who are no more than national entertainers, their sole hope of success being in capturing the people's imagination and focusing the public mind on spectacular antics. It is worth someone's time to study how far politics, as played by governments, has interfered with the normal development and activity of the public mind.

Mr. Harding had none of these tricks at his fingers' ends; he was not a star performer. It had been latterly urged upon him that as a matter of policy he could not afford to let Congress stay at home for nine long months. It was urged upon him that as a matter of policy it was desirable that Congress be called in special session that the people might have before them a spectacle of activity; a sufficient number would be deceived by the session into believing that the Government was really doing something. Mr. Harding resisted these calls, not respecting the motives behind them. Here was another example of his negative executive ability: when there was nothing to do, he did nothing.

Out of his fairness has come two results which should be of value to the country: Congress has been allowed to remain at home and hear the people think; and the people have been freed from the distractions of a special session. There never was a Congress with ability enough to do nothing when there was nothing to do. There never was a Congress that knew enough to undo the unnecessary things which previous Congresses had done in order to keep busy.

Some day, when the screech is taken out of history, the service of Warren G. Harding will have due recognition. He will be known as the peaceful President who created a national quietude in which the American people could make up their minds.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

It's Been a Great Summer for the Junketeers

Poor Old Mr. Taxpayer, What a Terrific Bumping Politicians Give His Purse

By ROBERT KENTON

EAST, West, North and South, toward all points of the compass the junketeers have been going, and wholly or largely at public expense! To the tropics when the weather was cold—to the arctic when the weather was hot—to the mountains and to the seashore—down the Mississippi and just casual wandering anywhere—

And everything provided free or at nominal cost by this good government of ours.

Most of these junkets were got up by or for members of Congress, who during their first long and inclusive vacation in about ten years are making up for lost time with respect to "pleasure-tripping."

A half-dozen Congressional committees are out on "wandering assignments" duly given by the last Congress. All of the expenses of the members of these are paid. Authorizations usually are very general—they can go where they please, do what they please, and draw on the contingent funds of Congress for expenses.

But Congressional committee junketing is only a moity of all that has been going. The pleasantest kind traces to no act or resolution of Congress. It is provided by the departments on their own initiative and responsibility and in small degree by private interests.

Only fifty to a hundred members of Congress are on committees that are authorized to travel around more or less as they please and at public expense until December 1 next.

But for departmental junketing every member of Congress is eligible, as well as outsiders, such as correspondents, and in one case anybody whom the chairman of a board wanted to invite. Hundreds have and many still are enjoying these junkets, which in the main have been delightful ocean cruises in romantic waters and along picturesque routes. Those members of Congress who haven't been on one or more simply didn't want to go or had important matters to look after at home. All told, from one-third to one-half of all members of Congress have taken these trips and in many cases entire families also were included.

The cost of this junketing epidemic? It is impossible to state it. Moreover, it never will be known.

It would be very difficult to specify that for those excursions duly authorized by law, for in most instances the wandering committees merely are told to draw on the Treasury for such expenses as are incurred. Some time in the far future these might be traced and calculated, but at present any estimate of them would be pure guess only. However, they are not large as governmental expenses go in these days of billion-dollar appropriation bills. Probably $100,000, certainly a few hundred thousand dollars, would cover the aggregate vacation expenses of Congressional committees that now are active.

Never Mind the Figures

THE public cost of departmental junketing is utterly beyond computing, either now or in the far future; for by a sort of mathematical alchemy, it is held that there is none, excepting, of course, crude cases like the *Leviathan* affair.

Departmental junketing takes place on government vessels, such as army or navy transports. This is the way junketing via the government vessel is initiated:

"Such-and-Such a vessel is going to Such-and-Such a place anyhow," says the departmental chief to members of Congress, to the otherwise politically eligible and to the journalistically elect. "There will be a lot of extra sleeping and lounging and eating space aboard. Come along, all of you who want a good trip. You can pay for the bare cost of the food you eat and for laundry service."

Thus the government apparently is out nothing, though its "guests" on these occasions get at a cost of from $50 to $100 trips that on vessels of commercial lines would cost from $500 to $1,000.

Since March 5 last it has been a case only of grab your suit case and catch the boat, and on its return, if you wished, you could catch another and keep going indefinitely. It has been possible for members of Congress to live on government vessels almost continuously since Congress adjourned and it is not improbable that some have done so. Moreover, as a rule wives and children can be taken along on the usual terms. It seems likely that these excursions will continue until next winter. And yet some persons say that the government has done nothing to cut the high cost of living!

Some estimate the probable cost of this year's junketing by national officialdom at several million dollars, but that perhaps is a little large.

The indirect cost perhaps is much larger than that measured by money. For example, following the adjournment of the last Congress, Representative Benjamin F. Focht, of Pennsylvania, in stating why some important matters had not been acted upon was quoted by the Washington, D. C., *Daily News* as saying:

"I was led to believe by the leaders of our party (Republican) that we would be able to get action. Then there began a spasm of old-fashioned logrolling. A lot of members wanted junket trips about the country at the government's expense. These junkets were thrown in to buy votes for other legislation."

A Washington dispatch published in the New York *Herald* of June 20 said:

"Officials of the government say that there never has been so much junketing and so many committees functioning with unlimited expense accounts."

An insidious aspect of this state of affairs was outlined in the same dispatch:

"There has been little adverse criticism among legislators of the great expense being incurred by junketeers and the special committees, because leading members of the minority party are among the participants. For instance, the Democratic National Committee at one time was disposed to denounce the junketeers and the investigating committees, but on investigation it was found that Senator Robinson, of Arkansas, minority leader of the Senate, was on the cruise to Alaska conducted by the War Department and had accepted all the perquisites and gratuities. It was found that Senator Harrison, of Mississippi, whose chief pastime in the Senate has been attacking Republicans for extravagance, was a member of the reforestation committee which has been trotting all over the country at the expense of the government since Congress adjourned"

Since Congress adjourned on March 4 last there have been three Government-conducted excursions to Panama, for the benefit (or pleasure) of members of Congress. Any member of Congress, and on two of them members of his family, too, could go on these trips, which lasted from six weeks to two months. "Guests" pay only for food consumed and for laundry service.

There was a similar excursion to Hawaii and another to Alaska, in addition to the trip of inquiry made by the President and his party on the naval transport Henderson.

Then there was Chairman Lasker's Leviathan party, participated in by nearly 1,000 persons, official and unofficial.

In addition, fifty to one hundred members of Congress, during the present Congressional vacation, are, as members of various active committees, authorized to go where they please, spend practically what they please and send the bills to Uncle Sam.

The cost? No expert accountant could find out, so thoroughly is it covered up or intermixed with other things. Some estimate it at several million dollars.

But any member of Congress who hasn't spent a pleasant summer wholly or in great part at the Government's expense had something else to do—or doesn't like luxurious traveling!

Too Warm in Washington

AN INTERESTING slant on how these undertakings, even when they embody considerable merit, are approached also is given in the same dispatch:

"The way the taxpayers' money is being squandered by members of Congress during the recess was emphasized today when the special joint committee of the Banking and Currency Committees, authorized to find out why more state banks do not join the Federal Reserve System, tried to arrange to hold meetings in Vermont.

"Some members argued that it was unfair for the government to expect them to sit here (in Washington) and work in the sweltering heat. They felt they were entitled to all the comfort of the mountain breezes. Then after trying the mountain breezes, it was planned to go to the seashore and hold meetings, the expenses incurred at leading hotels to be charged to expense accounts.

"One Senator, a member of the committee, put his foot down hard on the proposal. He said it was a most outrageous betrayal of a public trust and an uncalled-for and unauthorized expenditure of the people's money.

"Despite the protest of the Senator, it is understood the majority of the committee members intend to hold meetings at various places throughout the country on the ground that in that way they can get at the real objects why state banks are loath to join the Federal Reserve System."

What has become of the committee no one in Washington at this writing seems to know.

In fact, most of the wandering committee undertakings seem to have dropped largely from public view.

That having to do with reforestation has attracted some notice in its meanderings. This committee is looking into an admittedly important subject. But how it is doing so is indicated by the fact that it gave just one week's time to the three Great Lakes timber states, Minnesota, Wisconsin and Michigan, including a survey of the government's big wood products laboratory at Madison.

Another whose business it was to investigate the operations of the Veterans Bureau set going one great blaze in Washington immediately after Congress' adjournment and then apparently disappeared from public view.

Others seem to be conducting operations, if at all, wholly without publicity. These include:

A committee, headed by Senator Medill McCormick, of Illinois, which is authorized to look into the proposal of establishing a nine-foot channel waterway, via the Mississippi, between the Great Lakes and the Gulf of Mexico.

A committee which supposedly is looking into the production of gold and silver in the West.

A committee that is making a study of Federal penal institutions.

Another is to look into the Teapot Dome oil concession in Wyoming after a group of outside experts first survey the subject.

Valid and valuable results can come from these duly authorized investigations if properly made.

Those yielded by only semi-official junketing, which is far more quantitative, comprise merely possible additions to the general knowledge of the participants, which, in the case of many members of Congress, is admittedly not an unmeritorious consideration.

Charged for the Food

THIS form of junketing since the adjournment of Congress to date has included three journeys to the West Indies and Panama, one of them extending up the Pacific Coast to San Francisco. There it—Secretary of War Weeks' outing—divided into two parts, one going on to Alaska and the other to Hawaii. Forty members of the House and Senate sailed with Secretary Weeks on the army transport *Grant* from New York. This expedition followed almost immediately upon that of Secretary Denby, of the Navy, whereby the elect were provided with transportation to Panama for the naval maneuvers and then for a winding-about journey in the Antilles. This outing covered a period of six weeks and was shared by thirty-three Representatives or ex-Representatives and about a dozen Senators. Except the famous *Leviathan* excursion, this is the only one of importance that was a purely "stag" affair. On others wives and children of "guests" were permitted to go along. The total cost per passenger ranged from $1.25 to $1.65 a day—for food and laundry. As this is written, a third Congressional party is on the way to Panama via a navy transport.

Chairman Lasker's de luxe outing on the *Leviathan* was singular for that kind of governmental junket in that the guest lists were not limited technically to officialdom and the press; also in that everything was free. Nearly a thousand persons enjoyed that act of hospitality at public expense, the amount and necessity of which still are in dispute.

Our far-flung army and naval activities, together with the existence of numerous highly comfortable transports which make more or less regular trips "anyhow," make it possible for the military departments to promote junketing on any scale that suits their fancy.

It is not clear who is paying the bills for an informal Congressional committee that is now on the way to Russia to investigate Soviet affairs. One of its members has been quoted as saying that they were paying their own expenses. However, it has been widely heralded that a certain chain of newspapers will give exclusive publication of the "truth" which they are expected to discover and bring back. The owner of this chain of publications has been a conspicuous promoter of private Congressional junkets during the last year or two. He sent one to Canada to observe the workings of the sales tax and another to Savannah, Georgia, to welcome the last United States troops to return from abroad. His junkets, however, are none too popular with the run of members of Congress.

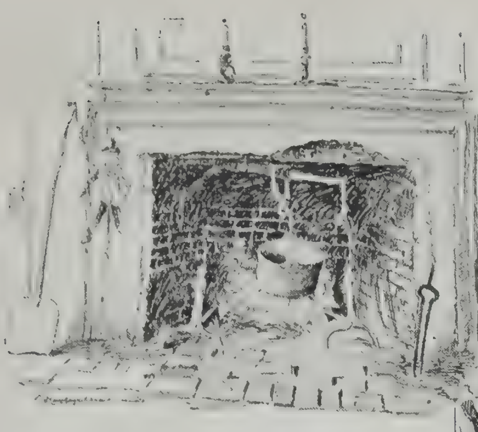
But a private junket promoted from another direction proved recently quite popular among the legislators who were invited. These included members of committees having to do with irrigation and appropriations. A big party of them left Washington recently for the Southwest as guests of the Imperial Valley Irrigation District.

Then there are many individual junkets at government expense. These are confined to persons in the executive branches of the government.

About a year ago a high official in one of the departments, accompanied by a newspaperman who acted as his secretary, undertook a journey around the world to collect information for the public. He was away for more than six months, and visited a dozen or more countries. A week or two after his return it was announced that he had resigned from the government service to accept a position with private interests at a salary many times that paid by Uncle Sam.

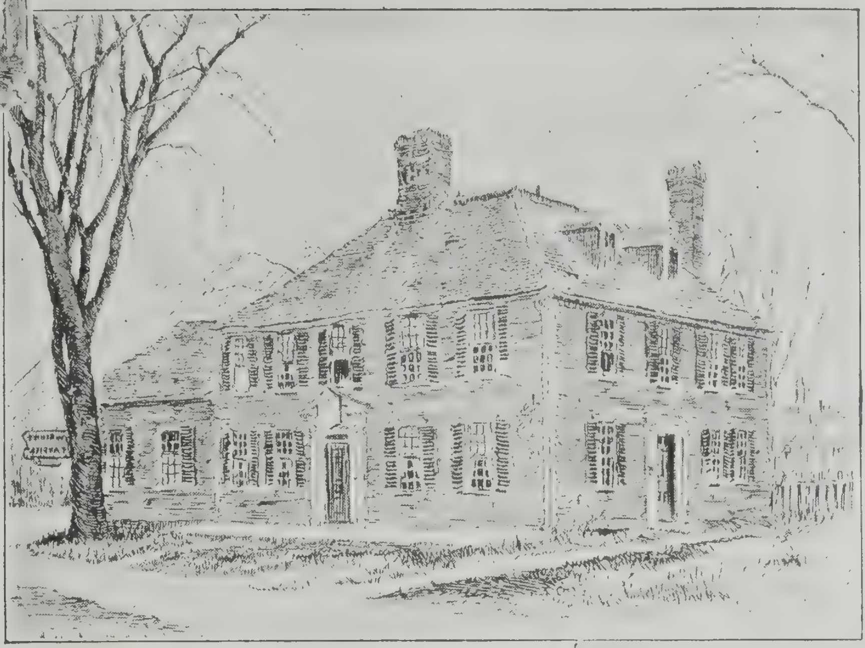
Those who participated in Mr. Lasker's historic *Leviathan* party and others who have been on trips, via army or navy transports, say that when it comes to hospitable entertaining your Uncle Sam is no slouch!

Beautiful Concord, America's Most Interesting Village



Fireplace in the Wright Tavern.

Home of Emerson, Hawthorne, the Alcotts, Hancock and Samuel and John Adams



The old Wright Tavern.

Main Street Lies on Sandy Ridge Where Americans Made First Stand in 1775

By MAY B. WHITING

CONCORD is rightly called "the most interesting village in America." The seat of the first Provincial Congress, the scene of the first forcible resistance to the British, the home of the American school of authors, the possessor of one of the finest pieces of outdoor sculpture in the country, the giver of a grape, the favorite of many lands—surely there can be no rival for first place in the hall of famous villages.

In 1635 the Reverend Peter Bulkeley and about a dozen families, searching for a place to settle, came out upon a scene so different from the wilderness they had traversed that they paused in delight, bought the land, and called their village Concord. The very landscape bespoke the name, soft and gently rolling, with the placid stream Musketaquid, or Grassy Brook of the Indians, flowing between wide meadows. Fate had a fine eye for contrasts when she picked out the scene for the opening battle of the Revolution.

The streets of Concord are wide and beautiful, with rows of elms and sycamores, beneath which many of the great and good have passed. Hawthorne, the Alcotts, Emerson, Thoreau, John Hancock, Samuel and John Adams, all have been familiar figures. And one April morning in '75, a thousand British soldiers, bravely clad in scarlet, passed through those highways which at dawn had seen the hurrying figures in homespun from the farms of Middlesex.

Many of the landmarks which they noted still remain to us. You may dine today with excellent cheer at the old Wright Tavern which Major Pitcairn made his headquarters. In the tap room stands the polished bar over which he ordered his morning toddy, and, as he stirred it with his finger, he remarked, "Even so will I stir the Yankee blood before nightfall." True indeed was his prophecy, although he did not then foresee his army in flight, himself wounded, his horse and pistols brought back to that same tavern by a Concord boy.

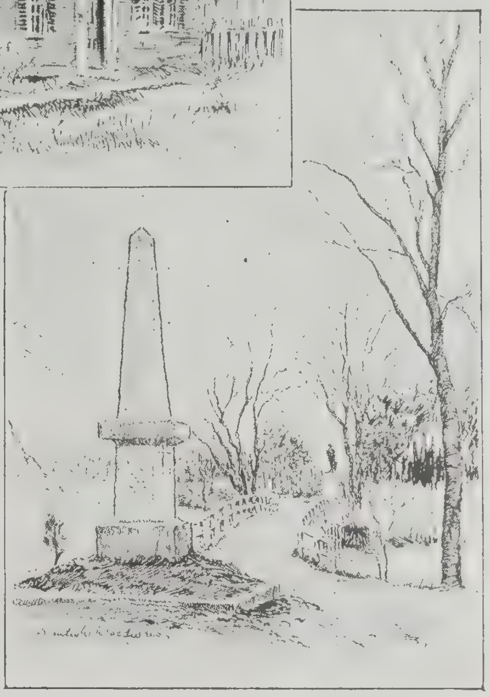
Early that morning, just after midnight, Dr. Samuel Prescott met Revere and Dow spurring toward Concord, and the three rode on together. But before they reached the village Revere and Dow were captured, while Prescott escaped, and, with bridle cut, arrived in the town in time to give the alarm.

The first to appear, musket in hand, was the Reverend William Emerson, grandfather of Ralph Waldo Emerson, and great-great-great grandson of Peter Bulkeley. It was in his church that the Provincial Congress had been in session not thirty-six hours before, and he himself had preached a stirring sermon from the text, "And behold God Himself is with us for our captain, and His Priests with sounding trumpets to cry alarm against you." Before long men were hurrying in from all the neighboring villages, Lincoln, Sudbury, Acton and Bellerica, until nearly 500 men had gathered.

The Main Street of Concord lies along a sandy ridge which rises somewhat abruptly to a hill in the center of the town. Here the American forces made their first stand. It was a beautiful morning. Winter had been mild and the spring work was well advanced. Grain had already grown high enough to wave in the morning breeze. Just before seven the Americans spied the British coming down the Lexington road, bayonets glittering in the sunlight. No doubt it was a fearsome sight to many a Yankee farmer, but there were bold spirits, like Emerson, who urged that they go to meet them. But the more sober counsels of their leaders, Brooks and Barrett, prevailed, and, seeing a detachment headed for the North Bridge, the Americans crossed over before them and went to Battle Lawn, an elevation about a mile beyond.

In the village the British set to work to destroy the military stores, for Concord had become a warehouse for the Continental army. They rolled a hundred barrels of flour into the mill pond, but, after their departure, the water was drawn off, and the flour was only slightly injured. They set fire to the Town House, the upper part of which was stored with powder, but Martha Moulton, a woman over eighty, besought them not to be guilty of so great an injury as an explosion would cause, and they put out the flames. They accidentally set fire, also, to the house of one Reuben Brown, a saddler, but they soon extinguished the blaze, for they had strict orders to do no harm to private property.

A special detachment was sent to search the Barrett homestead. James Barrett enlisted the Minute Men and had general oversight of the military stores. That morning the men of the household had plowed up a field, laid muskets in the furrows, and cast the earth lightly over. Nor had the women been idle. Miss Millicent, while visiting relatives in Cambridge, had met several British officers at cotillions, and one of them, more susceptible than prudent, had told her how they made their cartridges. Capable hands were soon at work on similar ones for the Minute Men.



The old North Bridge, Battle Monument in foreground.

At the approach of the British the young people hid in bushes near the house and the old grandmother, well past seventy, received them. They were hungry after the long march from Charlestown, with the ominous ringing of bells in their ears, and demanded food. She set before them brown bread and pans of milk, saying that the Bible commands us to feed our enemies. One of the soldiers offered her pay, and, when she refused, he threw the money in her lap.

An old man of the family made bold to express his opinion of British rule and a soldier raised his musket and threatened to shoot him. "Don't bother to kill me," was the calm reply, "I'm old and the Lord will soon save you the trouble."

The soldier put down his musket, a bit shamefaced. "Well, go in peace, daddy," he said.

In the meantime the soldiers in the village had collected some of the more bulky stores, as cannon carriages and a few barrels of wooden spoons and trenchers, and set fire to them. They also cut down the liberty pole and added it to the blaze. The smoke rose over the village, plainly visible from Battle Lawn, and it seemed to the men waiting there as if their homes must be on fire. With their young fifers, Luther Blanchard and John Buttrick, playing "The White Cockade," an old Jacobite air, the Americans advanced under orders not to fire first, the more strict because they did not then know that at Lexington the British had fired on the handful of men assembled on the Green and killed six on the spot.

Nathan Barrett, then a young man of twenty-three, has left an account of that day in a letter, which for simple, unimpassioned realism can not be excelled. He thus tells of the affair of the bridge as he saw it:

"After a while they (the British) begun to tair the plank of the Bridge. Major Buttrick said if we wair all of his mind we wood drive them away from the Bridge that they should not tair it up. We all said we wood go. We then wasn't Loded. We wair all ordered to Load—and had Stricked orders not to fire till they fired first and then to fire as fast as we could . . . .

"Capt. Davis had got, I believe, within 15 rods of the B (British) when they fired three guns one after the other. I see the balls strike in the River at the right of me. As soon as they fired them they fired on us. Their balls whistled well. We was all ordered to fire that could fire and not Kill our own men. It's Stringe that there wasn't no more killed. But they fired too high. Capt. Davis was killed and Mr. Osmore (Hosmer) and a number wounded. We Soon Drove them from the Bridge. When I got over, their was 2 lay dead and another almost Dead. We did not follow them. Their was 8 or 10 that was wounded and a Running and Hobbling a Bout, Lucking back to see if we was after them. . . . .After a while we found them a marching back to Boston. We was soon after them. When they got about a mild half (Mile and a half) to a road that comes from Bedford and Bildrica (Bellerica) they was a way Laid and a grait many Killed."

In the Elisha Jones house, just a few steps this side of the bridge, a little girl four years old stood by the window watching the approach of the British. In their bright uniforms they seemed to her like princes from Fairyland. When they came back, in wild disorder, many wounded and bleeding, the shock was so great that the sight remained with her, a sort of obsession, through her life of more than ninety years.

Her father had remained in the house, guarding his stores of salt pork and beef. But when the British passed in retreat he stepped to the door to watch them and a soldier paused long enough to fire at him. It was a good shot and the bullet hole may still be seen in the casement at about the height of a man's head. The next day Elisha Jones thrust a willow stick into the ground to commemorate the victory. It grew to a tree of enormous proportions until a summer gale blew it over; then a scion sprang up which still flourishes lustily.

For many years a bush marked the spot where Davis and Hosmer fell, "the burning bush," as Emerson called it, "where God spoke to his people." Today there is a splendid statue of a Minute Man leaving his plow, by Daniel Chester French, a Concord boy. On the face of its pedestal is carved the first stanza of the Concord Hymn:

"By the rude bridge that arched the flood,
Their flag to April's breeze unfurled,
Here once the embattled farmers stood
And fired the shot heard round the world."

On the opposite side of the bridge is Battle Monument, erected about a hundred years ago on the spot where the invading army stood and the first of the enemy fell. A stone set in the wall that skirts the road marks the grave of the British soldiers who, as their inscription reads,

". . . . came three thousand miles and died
To keep the past upon its throne."

Their muskets, together with the clumsy broadsword of James Barrett, hang in the house of Reuben Brown, the saddler, which for many years the Antiquarian Society has made its home. The Concord heroes lie buried in the old Hill Burial Ground, not far from where stood the liberty pole that April morning.

What a hill that is! Along its southern slope Peter Bulkeley and his friends burrowed rude dugouts in which to pass the first winter. On that hill was first unfurled the flag of liberty, the pine tree flag of Massachusetts. Hawthorne daily climbed its summit, pondering his romances. It was the Delectable Mountain of the Alcott girls in their play, and in its lee Bronson Alcott built his School of Philosophy. Along its side Ephraim Wales Bull found growing a wild grape of excellent flavor from which he developed the Concord. It is only a low, sandy ridge overlooking a placid stream, but the Seven Hills of Rome that rise above the yellow Tiber cannot surpass its glory.

Pinchot Politics in Pennsylvania Prison

And in the Meantime Long-Term Convicts Celebrate Bastile Day

By WILLIAM A. M'GARRY

THIS is a story of dates historically significant in politics and crime. It is a rather unusual story in that the mere chronological record of happenings furnishes an object lesson to good citizens everywhere on the wisdom—or lack of it—of trying to correct the misdeeds of practical politicians by electing reform politicians to office. Little or no additional elucidation is necessary.

By way of introduction it should be stated that Gifford Pinchot has long been famous in the annals of the Republican party as a leader of the so-called "Progressive element." In January, 1923, he became Governor of Pennsylvania. The story of how he got rid of Dr. Thomas J. Finegan, State Superintendent of Public Education, by suggesting a violation of the State Constitution which was scorned by Finegan, has been told in a previous article.

In February of 1923, while Governor Pinchot was very busy with legislative matters, trouble began to develop at the Eastern State Penitentiary. This is one of the oldest of American prisons. It is located in Philadelphia and has been overcrowded for years. It has 800 cells and 1,800 convicts, so that some large cells contained as many as six prisoners. At various times the jail had been investigated, but until February last Warden Robert J. McKenty always came through with flying colors.

The warden, however, is—or was—subject to the orders of a Board of Prison Inspectors, containing seven members. In February, as a result of many outbreaks within the prison, this board decided to give a hearing to a committee of convicts. Seven men were brought in, and they submitted a plan for self-government among the prisoners.

What Grand Jury Found

IT HAPPENED that factions had developed among the officials in charge, and when Warden McKenty found himself not represented, so to speak, on the committee, he picked or had picked a new committee of four. These men were recognized by the Board of Prison Inspectors, and, according to an official report of a Grand Jury which investigated conditions a short time later, they took almost complete charge of the prison. On March 16 or 17 the power of the four convicts was so great that other inmates gave them the title of "The Four Horsemen."

"The latter," says the Grand Jury Report, "lost no time in taking control. They ordered two of the keepers from their offices and established this office at a point where, as one of the ringleaders stated, they could be 'down near the center where they could see the officials.' This witness did not add whether this was for the purpose of protection or aggression.

"The committee promptly placed locks upon this office from the inside. One explanation for this proceeding was that they were given possession of many articles of value, such as beaded bags, the ownership of which was in controversy among the inmates . . . . In this office, after the committee had ceased to function and was transported to the Western Penitentiary, was found, among other things, a bar of iron with sharp-pointed prongs, the existence or use of which was not explained to the Jury."

The Four Horsemen issued cards of authority to twenty-seven delegates, fifty peacemakers and four committees. These entitled such prisoners to have free access to all cell blocks and yards at any hour of the day or night. The drug traffic in the prison was organized —by the Four Horsemen. So was the business of assault and battery. There were several riots. Two guards were disabled by convicts.

Ask for State Police

FRIGHTENED out of their wits, the Board of Prison Inspectors hurried up to Harrisburg and asked Governor Pinchot to send State Police to quell the uprising and prevent a general jail delivery. The Governor gave the situation due thought—and sent Dr. Ellen Potter, a venerable and respected physician who is head of the State Welfare Department, to investigate. Dr. Potter interviewed the Four Horsemen. She also sent questionnaires to the convicts.

In spite of that, matters became worse. Local police heard of what was happening and a special detail of bluecoats armed with sawed-off shotguns was stationed at the nearest police district headquarters. The police authorities offered to put these guards in the prison, but the warden and the prison inspectors would not hear of it.

By this time the newspapers were running daily accounts of the doings of the Four Horsemen, and at last the local courts ordered the Grand Jury Investigation. That ended—on April 17—the career of the convict rulers. Three of them were sent to the other state penitentiary—but one, for some reason, was allowed to remain.

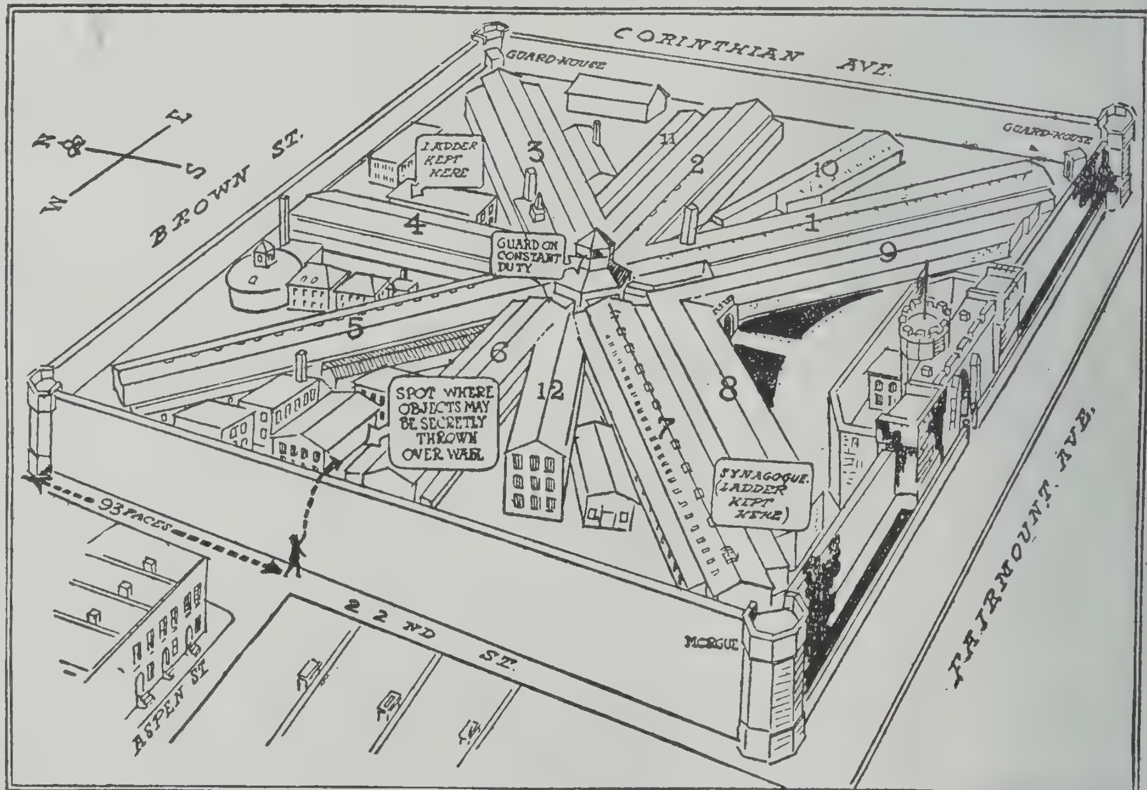
The warden about this time went away on a vacation, and it became evident that the Board had asked for his resignation. The members of the Board were criticized for inaction, but the fact was that the legislature at this time was considering the Governor's pet bill—the new administrative code, which would throw the prison board out of office, and provide for a new board to be named by the Governor.

On June 14 that happened. The bill was passed, and Dr. Potter, representing the Governor, notified the members of the old board that their terms had expired. With sighs of relief they quit. That left the prison with a deputy warden, a lot of badly terrorized and unarmed guards, and a sullen and dangerous collection of convicts to handle. In a short time, after giving the matter due thought, Governor Pinchot named Colonel John C. Groome as warden. Colonel Groome was noted as the organizer of the Pennsylvania State Constabulary. He announced that he intended to keep on living in his own fine suburban home, and not in the warden's residence at the prison.

In the meantime the most important date of all was drawing near. It was July 14—Bastile Day. That is the day celebrated by Frenchmen throughout the world, and remembered by all lovers of liberty as the anniversary of the fall of the Bastile in the French Revolution. Governor Pinchot, incidentally, is of French descent.

Since the old prison board was out of office, there was no legal authority to whom state appropriations for salary warrants and other expenses might be paid, and from June 14 to July 14 the guards had not been paid. They have not been paid at this writing, and will not be paid until the Governor finds time to name a new prison board. It is of interest that guards are paid $1,200 and $1,300 a year, and most of them have families to support.

At any rate, Governor Pinchot celebrated Bastile Day by acting on a number of legislative enactments. One provided a fund of more than $100,000 to build a stockade at the Philadelphia House of Correction, which has 1,700 cells and about half of them unoccupied. The Governor vetoed it. Another furnished an appropriation to continue building on a huge new state penitentiary project in Center County. The Governor vetoed it. Another contained the regular appropriation for the prison, large enough to increase the salaries of the underpaid guards. The Governor signed it—but not until he had lopped off so much of the appropriation that increases in pay are now impossible.



Philadelphia *Public Ledger*

The above drawing shows the method by which, according to former convicts, revolvers and other objects have been smuggled into Eastern Penitentiary. The man outside the prison first paces off ninety-three steps from the Brown and Twenty-second streets corner, as shown. Then, to avoid being watched by the guards constantly on duty at the towers, he steps back into Aspen street. From there he throws the parcel over the wall and into an alleyway. The diagram also shows the spots at which ladders, whose chains are said to have been tampered with, are kept.

Of course, the convicts at the Eastern Penitentiary could not have known on the morning of Bastile Day that Governor Pinchot intended to keep them jammed two to six in a cell at "Cherry Hill." It is a mere coincidence that they should decide to celebrate Bastile Day by taking French leave.

Along about 8:30 o'clock in the morning six of them did that very thing. All six were in for long terms, for such crimes as highway robbery and murder. Warden Groome was out in the suburbs. Governor Pinchot was busily vetoing, or getting ready to veto, at Harrisburg. And somehow the six men made their way from one corner of the great jail to another—from the northwest to the southeast. In so doing they had to pass through two cell blocks. They carried with them a cabinet in which was a fitted ladder. In the southeast corner they caught, bound and gagged a guard and locked him in his own sentry box, after cutting the telephone wires. They then climbed the ladder to the top of the wall, fixed an iron hook in the masonry, dropped a rope made of stocking yarn wound with tire tape, and twisted bed sheets, and slid forty feet to freedom.

A truck driver, held up at the point of three revolvers suddenly produced by the convicts, carried them a few blocks. Then they stopped a five-passenger sedan and forced the driver, according to his story, to drive them to Elkton, Maryland. There they tied him hand and foot and left him —with the car intact. The next day he came all the way back to Philadelphia to notify the police, instead of using the telegraph or telephone.

A day later it was learned that four of the convicts had seized a launch at Pocomoke City, Maryland, and had put out on Chesapeake Bay, bound perhaps for impenetrable cypress swamps. The two others had disappeared, and no word has been had of any of them since.

And what was the great state of Pennsylvania and the reform Governor doing in the meantime? Raising a hue and cry, and searching all roads, and sending state police after the prisoners? Not exactly.

Governor Pinchot was awaiting a report from Colonel Groome.

Colonel Groome was making an investigation.

The Philadelphia police were sending out thousands of photographs and finger prints of the six men, and urging sheriffs and police chiefs everywhere to capture them.

After a week of this somebody had the temerity to suggest that the state ought to send at least one detective, or state trooper, or policeman, or prison warden, after the convicts.

"The capture of these men," said Colonel Groome, "is up to the police."

City Has No Power

THE Eastern Penitentiary, however, is a state institution. The city of Philadelphia has absolutely no power over it. City police, therefore, who planned to send a lone detective to the fastnesses of the Chesapeake, thought better of it before he could buy a railroad ticket. So far as anyone has been able to learn, the State Police did nothing. They could not act without orders from higher up—and the Governor of Pennsylvania was awaiting a report.

Pennsylvania is now operating under a reduced budget forced through by Governor Pinchot, who has announced that everybody must economize during the next four years. At the time it was put through the taxpayers fully expected to keep on feeding six killers, to protect themselves and the taxpayers of other states. Now they will be saved that expense—in Pennsylvania. If residents of other states are held up, robbed, beaten and perhaps killed—"it is up to the police." One farmer in Delaware was robbed of five suits of clothing, many pairs of shoes, a shotgun and other weapons while the men were on their motor ride southward.

It has been pointed out above that the guards were not paid up to Bastile Day. Prison experts have been puzzled to understand how the men could escape, how they could build a ladder without detection, how they could get three revolvers, and the plentiful supply of money they are known to have with them.

The report of the April Grand Jury explained in detail the graft system in effect at the penitentiary. Overseers and guards were charged—and in many cases it was proved—with maintaining a regular schedule of prices for the delivery of narcotic drugs, whisky, gin, moonshine, and illegal visits. The report proves without doubt that there was a price on anything a convict wanted, if he had or could get the funds to pay.

When Governor Pinchot vetoed the bill that would have relieved crowding and made it possible to hire

(Concluded on page 15)

Present Money System an Elaborate Trick: A Great Speech by Professor Frederick Soddy

Expanders of Debt Falsely Pose as Creators of Wealth: They Simply Absorb Wealth That Labor Has Created: Can We All Live in Idleness on Interest?

By JOHN BASIL BARNHILL

WHEN John Ruskin dared to tell the political economists of his day that orthodox political economy was not a true science but that it stood to the real economy in the relation of alchemy to chemistry; a mere pseudo-science, needing reformation and reconstruction; when he went further and said it was not a *political* economy at all, but only a commercial economy, since it dealt one-sidedly with the aspects and advantages of the trading classes only, not with those of the community at large; and with the trading class in one age only, in one society and form of civilization only, regardless of what might be learned of the spirit in which other commercial nations, such as the Venetians, had conducted their enterprises—when Ruskin wrote and lectured in this vein, the culture of his day voted him a madman.

But in the long run "truth is never offended but always defended," and now comes Prof. Frederick Soddy, Fellow of the Royal Society of England and undoubtedly Oxford's most brilliant physicist, who indorses Ruskin's position most unequivocally, tells our political economists that they are "solemn portentous recorders of conjuring tricks with bits of metal and paper," and denounces our present money system as "an elaborate confidence trick."

In this speech, delivered at Oxford, England, Prof. Soddy pointed out that the weakest point in present-day popular thought was its inattention to the money question, and urged the taking up of money reform as the most essential of all reforms. Prof. Soddy spoke in part as follows:

My own conclusion is that the failure of civilization is definitely due hitherto to an almost entirely unsuspected fallacy in our material or physical ideas about the nature of wealth, rather than to any special moral delinquency on the part of those responsible for the form and growth of our institutions. Without a clear understanding of this fallacy, not even angels could bring power and prosperity to the world troubled by wealth . . . .

Confounding the People

A MAN who has been the victim of a confidence trick is so much more anxious to get at the trickster than to understand the trick. Yet this money trick, which has converted an era of what ought to have been the greatest material prosperity the world has ever known into one remarkable for its squalor and sordid destitution, is well worth a dispassionate inquiry. Like all conjuring tricks its success depends more upon the trust of the dupe than upon the magical cleverness of the conjurer.

The first condition of its success is to make people confound money with wealth. This is easy. For the individual the two are interchangeable. Money in all its forms is a claim upon the existing wealth. To the individual it is a credit or acknowledgment on the part of the king, acting as the head of the state, and due authority to express the fact that I, Georgius Rex, authorize the holder of this token, this bit of metal or paper, to obtain in exchange for it a certain amount of wealth. So long as the owner does *not* exchange it but keeps it, all the more wealth for those that do, because real wealth, in contradiction to the token of it, is perishable and the seller cannot indefinitely hold it up—it rots.

Now look at it from the point of view of the state instead of the individual. The token is no longer a token of wealth, a credit, but a token of debt or debit, redeemable upon demand and not bearing interest, in theory at least, as a coin or note, that is to say. Hence *when you can induce a nation to think of its money as the same thing as its wealth, instead of the exact opposite, namely, a debt, or claim upon its wealth,* as it is from every point of view except from that of the individual owner, its notions of economics are identical with those of the old lady who overdrew her account and sent the bankers a check for the amount.

The Papier Mache Coins

IN EARLIER days the illusion was much assisted by the practice of making money of gold and silver. I do not know whether the kings and rulers ever really shared the delusions of the vulgar that gold and silver are really wealth. Kubla Khan, the great Mongol Emperor of the twelfth century, certainly did not, as some of his coins are still extant and they are made of papier maché! Old Aristotle certainly did not, and he lived twenty-five centuries ago. His economics dealt with the wealth of nations, not their debts, and he named the study of the latter "chrematistics," a word you will still find in the dictionary, though this term would not be understood if you did not explain it. Today there is not a political economist left; they are all become chrematists, solemn portentous recorders of conjuring tricks with bits of metal and paper, which they claim has become a science, as indeed it has, the science of token wealth; but it is not economics.

Let us get back to earlier and more correct notions of money. The first is that it should be genuine and not counterfeit, and that it should not be privately minted or coined either by the small counterfeiter of bad half-crowns or by the big money-lender or usurer.

What are the facts? *Not one-tenth of our money today is of this character.* The Royal Mint, it is true, still issues the *small change* of the realm. The big money, over nine-tenths of the whole upon which our industries are carried on, is, I understand, issued privately in the form of bankers' loans. All is quite legal, of course—such is the law! It dates back to 1844 before the new ways of life which science has made possible were within the imagination even of madmen. It resembles an antique piece of machinery such as one may still see in the South Kensington Museum coupled to a modern prime-mover. Legal or illegal, its effect upon the community is precisely the same.

Loans—Two Kinds

LET us be perfectly clear on this one point. A money loan may be either genuine or fictitious. It is genuine if the lender gives up his purchasing power to the borrower. It is fictitious if both the lender and the borrower possess the purchasing power formerly exercised by the lender so that a doubling of the purchasing power results. In olden times purchasing power was acquired by withdrawing money from the banks, distributing it among the purveyors of commodities who, when they had collected enough, took it back to the bank again. Today this is used only for small transactions. The regular plan is payment by check, which confers purchasing power on one set of the banks' clients precisely at the same moment it is withdrawn from another set, so that, although the clients are using their powers to purchase, their aggregate deposits in the bank remain substantially unaffected. On the strength of these the banks issue purely fictitious loans to third parties. They demand securities, it is true, but they only sell these, so withdrawing the equivalent of purchasing power from a fourth party who buys the securities, if the borrower defaults. Normally this does not occur. Before the loan was issued the community owed the banks' clients so much wealth, and after the loan it owes them precisely the same amount, but in addition it now owes a third party an amount equal to that of the loan. I am not discussing the morals or ethics or even the commercial convenience of the transaction, but its *effects, which are indistinguishable from those that would be produced by a private issue of new money.* If you carry the matter to its logical conclusion with all the banks united into one combine and all the citizens depositing their money with them, then the deposits will represent the national purchasing power. For the privilege of keeping the accounts of our mutual indebtedness the banks will exercise a new purchasing power the equivalent of that possessed by the whole nation. Our system is reducing the institution of money to the level of an elaborate confidence trick. . . .

Must Coin Own Money

I LEAVE it to you to judge whether I have exposed the real instrument by which the creator of wealth is cheated out of the produce of his labor by the creator of debt and the true explanation of the great paradox, *"In poor countries the people are comfortable, in rich countries the people are poor."* Our currency system is derived unchanged from a past era, almost stagnant relatively to the present, in regard to the revenue of wealth. Science and labor have increased that revenue tenfold if not a hundredfold. They are remunerated, if it all, *at the expense of another.*

If I make a discovery of value and increase thereby the world's wealth I am remunerated out of the money which otherwise the public would share among its members without me. The public is the worse off, not the better, for the increment of wealth I have created. The usurer in a palatial establishment, furnished with every ostentation that can give the illusion of bottomless wealth, on the strength of the workers having increased the wealth of the world, issues a wholly fictitious loan to his clients and calmly pockets the increment. Who but a fool would trouble to create wealth while money can be privately coined? What is the use of creating wealth if you do not control the only instrument by means of which it can be acquired?

The only way by which in rich countries the people can escape poverty is by coining their own money and not allowing it to be coined privately under any pretext whatever. In stagnant countries, such as those of our pre-scientific ancestors, the problem never arises. It is in communities where the revenue of wealth is being expanded by discovery and inventions, and by the people working harder and more efficiently, that the increment of wealth must be met *by a corresponding fresh issue of currency and this issue must be issued by and to the people, to the consumers and producers, not by and to the money lenders.*

Let us pursue the present system to its bitter end. What *is* the goal? Nobody knows. *Ruskin asked sixty years ago and has never yet been answered. . . . .*

Never before, and as I read the situation, never to the same extent again, will the world have the opportunity it had at the beginning of the century, to build a civilization worthy of our intellectual and material pre-eminence. Whereas what has happened you know as well as I, or better.

Let us try, in conclusion, to depict the present situation. Our revenue of wealth is colossal, *but only a relatively small and unimportant fraction of it is consumed in living.* This revenue could be further increased by science and labor to almost any extent likely to be required were there any point in that. It has been estimated that, with trifling exceptions, America alone could supply the world for 100 years without overworking, the rest of the world being idle.

Civilization in a Ditch

WHERE does it all go? By far the greater part goes in the pursuit of the perpetual motion fallacy, to "save" so much that enough at last will be accumulated to go round and the world can live on the interest. *Not one-fourth goes on consumption proper.* Three-fourths goes to capital consumption, that is, is "saved" as far as the individual in concerned, which means lent at interest, which means spent by somebody not the owner. . . . . What for? The answer you will find in Ruskin, "For the nourishment of rats and worms." If we must "save" seventy-five per cent of our revenue, we must be told definitely what it is for.

Schemes of social amelioration are, in themselves, most admirable, but before we think much about where we are going, when we start, it is necessary to repair the car which has broken down or we shall not be able to start at all. Civilization is in a ditch. It is crowded with people anxious to get somewhere and that the magnificent opportunity which may never recur shall be used to get us as far on the road to happiness and prosperity as possible. It needs a mechanic to repair its mechanism. The production of wealth is no longer an unknown problem to be done by rule of thumb and old traditional wrinkles. It is a science in which little remains to be found out.

Distribution Unsolved

THE distribution of wealth is, on the other hand, an unsolved problem and the machinery by which wealth is distributed is money and finance generally. This has completely broken down. My advice, if I may offer it, is to attend to this, not as one of the reforms needed but as the essential reform before anything else even is possible.

John Stafford, another English writer, agrees with Prof. Soddy that interest-taking involves a fatal contradiction. He says:

"Not perhaps until the nineteenth century were people found so credulous, so blind, so ignorant, as to believe that if everyone had ten thousand pounds everyone could live upon the interest of it without doing any work. For that is what we practically believe. We laugh at the old joke which represents the inhabitants of the Scilly Isles as 'earning a precarious living by taking in each other's washing,' but we act on the belief that we could all live by lending one another money, if we only had it. . . . Not until it became evident that more gains were to be made by a low rate called interest than by a high rate called usury did the hiring out of money become a highly respectable calling. Not until under the tutelage of William Pattison our governments found it so much more convenient to borrow money than to tax the public and the wealthy found in a national debt an easy method of becoming pensioners of the nation, did interest or usury become an institution of the country, to be regarded as as natural a process as that of the growth of many potatoes from one."

Wild Life of the Northwest Rapidly Fade

Their Value to Society: What Their Loss Would Mean: Their Safety and How We Can Protect Them

By F. J. CLIFFORD

ABOVE the snowy peak, a golden eagle wheels about, his eight-foot spread of wings bearing him on and on. With telescopic eye, he watches for his prey below. A majestic bird, besides our national totem sign. There is not much danger of his extinction.

Near the snow line, mottled coated ptarmigan, a partridge-like bird, scuttle to safety as the shadow of the big eagle drifts over them. If it were winter, they would sit still in the snow, as then they are white—their protective color. Their value is largely sentimental, though where numerous their flesh is a welcome addition to the adventurers' fare. They are generally holding their own against exterminative modern influences.

On the rocky side of the mountain one sees a white spot resembling a pearl in a dark setting. It seems to move. Closer inspection reveals it a mountain goat. His habitat is so high, he looks below for trespassers. His feet are fitted with rubber-like pads with which he can scramble to places that the human foot cannot follow. His flesh as a food resembles mutton and is enjoyed by many. As a game animal, he is a worthy opponent, for it takes a steady hand and stout heart to get him. When cornered, he will fight most viciously, using his sharp-curved horns with deadly effect. A friend of mine out of pure deviltry matched his climbing ability against that of an old billy, following him far out on a knife-edge, hog-back of the mountain. The wind whistled across his perch, the up-ended slabs of rock underneath him seemed to quiver. The goat suddenly turned on him. He could not retreat quickly enough to keep away from those menacing black horns. He must escape them. With a quick gasp and a frightened glance below he flung himself on the smooth rock to the side. Along it he shot and catapulted over the edge. A bank of softened snow caught him in its wet folds. He put in the rest of the day getting out of his precarious position and back to camp—his appetite for goat-study quite satisfied. The goat is a picturesque fellow, and demonstrates how animals can survive under the most brutal surroundings. He is protected the year through in many places and so is increasing slightly.

Among the Broken Rock

THERE is a steel-gray animal that resembles a woodchuck though considerably larger. His home is at a high elevation like the goat. Whistler is the name he goes by. You will find him among the broken rock. One time, when I first hit the country, I was toiling along up the steep side of a mountain. Stopping a moment to mop my perspiring face, I was startled to hear someone give a sharp whistle of attention, though I did not suppose there was anyone within miles of me. But I whistled back, then asked who it was. No reply. Presently the blast was repeated. It appeared to come from no particular direction. After much wondering and watching I descried the form of its author, sitting bolt upright among some boulders. People who know, use the whistler's skin for rubbing horses and themselves to keep away the mosquitoes and fierce deer-flies. Pack animals soon come in of their own accord every day or two for a rub of the whistler skin. There is not much danger of the whistler's extinction.

Lower down among the grotesque-shaped trees we find the bighorn sheep. Hiding the wide curving horns and short legs, one might mistake him for a deer, as the hair is much the same. The mountain sheep do not have wool like their domestic brethren. Near by some funny lambs butt each other around, ever watchful for the eagle, who prefers to catch them in an exposed position where he can swoop down and knock a lamb off on the rocks below. There, safe from the vicious onslaughts of the mother, he can grasp it in his long talons and sail off to his fledgings on some lonely crag.

Many hunters argue pro and con as to nature's reason for putting heavy horns on the animal. One old hunter told me quite solemnly that the sheep uses them to land on in making some of his jumps. He got his theory in finding small rock buried in the horn. The "bighorn's" weapon of defense is his head, so nature put a lot of weight there, as we put weight in the hammer head instead of the handle.

More than one mountain lion has had his ribs cracked and been hurled down the rocks by the quick smash of the vicious head. Lacking any opponent of his own kind, he will hurl himself at a rock, to practice on. His flesh makes the finest of meat. As a trophy of the chase he nearly tops the list. He is about the most difficult to get of all game animals. There are only a few bands left in the United States, outside of Alaska. Before the advent of the white man, the bighorn sheep sought the lower hills in which to winter. Now they are compelled to stay in the high mountains which is unnatural for them. They are gradually diminishing in numbers. Their loss will be keenly felt by all lovers of wild life.

Off to the right on a lonely wind-swept ridge we find an animal shambling clumsy-like along. His low-swung head and high shoulders proclaim him a grizzly—king of all beasts. His silvery sides glistening in the sun might put him in the silver-tip class. He is one of the most cunning and shrewd of all wild animals. I am also sorry to say, he is an outlaw. He never hesitates to kill range cattle, sheep or anything he can get his terrible claws on. I tell this as I found it in the forests. I do not see how he can survive as a game animal outside our national parks. Even there they are compelled to kill him when he starts on a rampage.

He is the last of the bear family to hibernate, sometimes plowing through two or three feet of snow to his den in some cliff, ofttimes where no human foot can follow. His flesh is not relished as a food. His hide, however, is much sought after, and is valuable. It takes a stout-hearted hunter to bag one. They are becoming extinct. Most of us will hate to see the grand old fighter disappear from his mountains.

It may seem strange, but there are more deer east of the Mississippi than west of it. Also there are more killed. The mule and black-tail deer have a fatal habit, when disturbed, of stopping to see who their enemy is. This makes them fairly easy prey. But they seem to be working out of the habit somewhat.

During the running season the bucks will cover as much as 20 miles in a day or two of their wanderings. This is nature's way of keeping them from inbreeding. The buck never protects the does or fawns from an enemy. When danger threatens, he is the first one to light out.

The hair is worthless, but when removed, leaves a hide that tans beautifully. The head and neck makes one of the prettiest mounts obtainable. Their economic value is high. Sentimentally it is limitless. The varieties spoken of are gradually decreasing in numbers. A few years ago they came down to the ranches for protection. They were slaughtered by the carload both in season and out. Now they have retreated to the highlands where their natural enemies may bring them to a sudden extinction similar to the passenger pigeon and buffalo.

The big brother of the deer we will find out on the semi-open ridges and valleys. It is the elk. He is a majestic animal with his long wide-spreading antlers. The greatest trouble with him is his easy domestication. He quickly learns to feed at the ranchers' haystacks. This causes no end of trouble and robs the elk of their ability to rustle during the winter months. It seems hard for them to survive changing conditions. Some way may be worked out to save them from extinction. Elk hide is valuable for diversified uses. The flesh is of the best. The loss of the elk would be a bad thing in many ways. The Yellowstone Park officials are making heroic efforts to save them.

His close brother, splashing about among the lily pads of the lake, is the big moose. A mighty animal and cunning as he is big, his numbers are steadily increasing, especially where the game laws are enforced. He will not domesticate, is very timid and will seldom show fight. His hide is valuable in many ways and the flesh is good. When mounted as a trophy, the head forms an object of which any possessor might be proud. There is not much danger of the moose's extinction. At least not till the country becomes more thickly populated.

Could we move our mountain about, we might include, a few, very few, pronghorn antelope on the foothills about its base. They were once a plains animal and distributed all over the West. Now there is a small band of them in Texas, a few in the foothills of Nebraska, some in the Yellowstone Park and quite a large band in the Wainwright herd of Alberta, Canada. A persistent curiosity spelled their doom. To illustrate, I will relate an incident that happened in Texas. We were traveling in a car. And it was some car for those days—it had all of two cylinders and would make 25 or 30 miles an hour. We spied a band of some 20 antelope, who as usual started to circle to our right. We took the inside and circled with them. Now that smooth prairie stretched for 50 miles away on each side of us. But would those pronghorns take any other direction? No, sir, they just had to circle round us. We had made about half of it when we were running with them neck and neck, not over 40 feet apart. It was a beautiful sight to see them racing along. Their bodies did not seem to be in action, just their slender legs twinkled back and forth. The old two-lunger coughed her loudest but the fleet-footed animals swept on out of sight. Their numbers are decreasing.

Just a Few in Parks

THE numberless buffaloes have shrunk to a few cared for in parks. There is just one band of some 50 that is living the same as in the old days. They inhabit the wildest and most inaccessible parts of Yellowstone Park. They seem to be holding their own. Their value is the highest, as the hide makes beautiful robes and their flesh is considered superior to beef. There is not much danger of their complete disappearance.

On a flat rock overlooking a game trail we see a tawny creature stretched out. He may have been there a few hours or a day or two. It is a cougar (mountain lion), waiting for some unwary deer to come along. He will spring on them and quickly unjoint their neck with his powerful paws. The belly is then carefully slit open and the liver rolled out, this he eats first. A kill is seldom returned to unless the lion is forced to through hunger. He will kill some 60 deer each year. Occasionally, however, he fails to kill his victim. One time I was trailing a lion and came to a place where the big cat had jumped on a buck, he rode him for 50 yards, his long tail striking the snow here and there as he balanced himself. At a little rise in the ground the deer made a sudden turn and piled the lion off along with a lot of his hair. I figured that the buck's thrashing antlers kept the cat from getting the fatal neck-hold.

The cougar is a supreme coward around mankind. He has one other trait that equals his cowardice—it is his curiosity. He will follow a person for miles but never make an attack. He is a tremendous traveler but is seldom seen. Their loss would be little deplored. Fortunately their numbers are being reduced somewhat.

Down in the creek bottom a bunch of sarvis bushes are being violently agitated. A hairy form sits bolt upright in front of them. One forearm encircles the bushes and pulls them down, the other paw is used as a comb. With it the animal strips off berries, leaves and twigs and flips them into an ever hungry mouth. He is the vagabond of the woods, the brown bear. Sometimes he is black, other times light brown, some are almost white, much the color of a Poland China hog. Their color varies as nature happens to dab her brush. The brown bear does but little killing. They are trained to eat meat through the dying sheep along the trail. Coyotes kill a lamb, the mother dies of milk fever or "black bag" as it is sometimes called, along comes our bear and feeds on the carcass. He is blamed for the killing of it. Sometimes sheep are drowned, and he finding the carcass is quickly blamed for their death. There is no doubt but what he kills some sheep, but not nearly so often as he is charged. Wherever the sheep hit one of his huckleberry patches it is not long till it is ruined or destroyed. Thousands of acres of the bears' feeding ground is hurt in this way. They are very timid and will attack no one. There is nothing among all wild life quite as comical and amusing as a pair of the cubs. They are forever playing or quarreling, when not being given a course of training by their mother. One late spring while out on a hike I had stopped to look around a bit, when my attention was attracted to a slight hubbub just over a small ridge from me. The breeze was in my favor so I crawled cautiously in that direction. Peeking over the top of the knoll an amusing sight met my eyes. A mother bear was giving her rather unwilling cubs some strenuous training at teaching them how to climb a tree. She would walk off 20 or 30 feet from the tree and suddenly turning would rush to it and up several feet. Then with many a cuff she would make the squalling cubs attempt the same. One little yellow woolly fellow did not "savvy" at all. He put his small paws up against the tree like a cat sharpening her claws and his mother impatiently cuffed him aside. The brown one got his stubby arms around the tree and hunched up a foot or two. Suddenly the mother sat bolt upright, her sensitive nose searching the wind from every angle. With a wo-o-of, wo-o-of she ga-walloped, ga-walloped off, her small progeny scrambling desperately at her heels.

Bears Are Protected

A MOTHER bear keeps her cubs with her for two years, at the end of which she again mates with the same male if she can find him. Her young are no larger than a chipmunk when born. She nurses them for a couple of months before she obtains any water or food for herself. When bears hibernate they carry several "chewing sticks" in their den with them. On these they chew occasionally during the winter, partly for amusement but mostly I think to keep their teeth solid. It is claimed that the Ozark mountaineers crawl into their dens and putting a rope around the bear's neck, haul him out and knock him in the head. The story might be true as it takes a few moments to rouse a hibernating animal.

The loss of this wayward vagabond of the woods would be keenly felt. I believe he is holding his own as most states are protecting him.

Farther down the creek we find the beaver, a prehistoric cousin of the bear. Such an engineer as he is! Many times I have tried to destroy his dams where it was flooding meadow land. I generally made a poor job of it. The stream and small logs are so interlaced, it is well-nigh impossible to dislodge them. The water rises along the mud-covered sloping face of the dam. It spills over onto and down through the crisscross sticks. This so breaks the fall that it washes nothing away. It fills the same office as the splash apron of the huge dams erected by human engineers. The beaver place cut pieces of willow and aspen on the bottom of the pond for winter food. When disturbed they generally float to the surface and no matter how much a person tries they cannot make them stay on the bottom again. The night before it permanently freezes for the winter, not before nor after, they plaster their house with mud. This freezing along with the surface of the pond gives them ample protection against the wolf, lynx and cougar. The beaver is a powerful swimmer and an efficient woodcutter. His flesh is not used by the white man; his pelt, however, ranks close at the top in value. The beaver was nearly extinct at one time. Now most states permanently protect them. Where they are doing damage they are trapped alive and transported to the high mountain territory where they can thrive and do no harm. Sometimes they persist in coming back to the old grounds. Their extinction would be a distinct blow to the fur industry besides robbing society of one of nature's finest handiworks.

Otter are sometimes seen along the rivers but are nearly gone. The prairie dog, once so numerous, is decreasing steadily.

MARY HUNTER AUSTIN

Mary Austin—A Prophetess of Desert Places

Famous Woman Writer Holds Southwest Will Be Seat of "Next Most Powerful Culture in the World"

By FRED L. HOLMES

"THE Southwest is to be the seat of the next most powerful culture in the world—equaling the culture of Ancient Egypt and Greece in its power to affect the world's history and human development."

This is what Mary Hunter Austin, the famous writer of stories of the Eastern California slope, told me at Santa Fe, New Mexico, where she was gathering full information on this theme. She had just returned from a 2,500-mile motor trip during which she had visited all of the delightful places around which she will weave the warp and woof of her story.

And into such a quaint old city she had gone to conduct her studies. Santa Fe is suffused with the brooding glory and history of the past; with tales of old mission houses and renegade Indians; with stories of pocket hunters for gold and the roughness of mining camp. There is probably no settlement within the domain of the United States over the history of which so much mystery has hovered as the capital of New Mexico. Some historians have claimed for it an antiquity exceeding that of St. Augustine, Florida. More truthfully, others have given it a second place in point of age, notwithstanding the strong but groundless belief, still somewhat prevalent, that Santa Fe had a teeming, prosperous, aboriginal population, when the Spaniards under the Coronado first made their appearance in New Mexico in 1540.

Mary Austin writes the stories of the Southwest because she is steeped in its antiquity, its legends, its ethnography and its history. She was a pioneer on the fringe of "Death Valley" in Southeastern California, when the trail route was whitened in summer by the bones of its lost and thirst-choked travelers; when it took a stagecoach ride of 130 miles to get her to the nearest railroad station; and when the yelp of the coyote and the glow of the sagebrush were a consolation for loneliness.

It was at Carlinville, Illinois, that Mary Austin was born, September 9, 1868. On her mother's side she descended from the family of the celebrated French chemist, Daguerre. Carlinville is a small town.

"Just the sort that our younger generation of novelists are proving to be so desperately uncultivated and impossible as a background for the intellectual and artistic life," Mrs. Austin declared in a spirited defense of her birthplace. "I didn't find it so, for though I have described it as I found it in 'A Woman of Genius' —years before Main Street became a term of contempt—I still love it.

"I am more amused by American life than contemptuous of it, and I have the most intense intellectual interest in what is developing here; think it vastly more important than anything now going on in Europe."

This little, world-traveled woman, with an abundance of hair, seemed to think herself fortunate that she was born before the flood of so-called children's books. Early she became familiar with the English classics and the studies of these with "an intimate acquaintance with nature" occupied her years until the end of her university work.

As ill health drove the Kansas-born Enos Mills to the mountains of Colorado, there to transform a country lad into a great nature writer, so it compelled the Hunter family to take Mary, at nineteen years of age, to live on the untamed, sun-blistered lands between the Sierra Nevada and the Mohave Desert. Trained as a teacher, she followed for a time her profession in the unconventional life of mining towns and in the wickiups of the Indians, finding it an exceptional opportunity to push her investigations into child study.

"I knew as soon as I knew anything," continued Mrs. Austin, "that I would both write and teach. I never did give up teaching, though I no longer hold salaried positions. I lecture at teachers' institutes, last summer at the summer school of the University of California, the summer before at the Fabian summer school in England. To me the whole process of life is education, and my books are merely to tell what I have learned at the school of life."

Already she had got away from the chronological thread of her life story. She would tell her theory of writing and the reason for a great variety in her books.

"I always write about the thing that at the moment I know and care the most about—about outdoors, about 'The Man Jesus,' about 'Love and the Soul-Maker,' about 'The American Rhythm,'" she went on. "I write it in any form best suited to the subject, essay or play, story or poem.

Like most desert-dwellers, the spell of its mystery soon enthralled her. She gave up teaching in the Los Angeles Normal School and returned to life in the hills. There she married Stafford W. Austin, a register of the United States Land Office and a botanist. He took her deeper into the desert, first to Lone Pine, then to Pine Creek, where a home was built on a little rill, looking toward Kearsarge. Sagebrush grew up to the door and Piute Indians were her principal companions.

There was much to do. She did housework and gardened. And she wrote. No one had before written about this desert with its hummocks of wind-driven sand, its thirsty soil, its stubby shrubs and the still calms on the tilted mesas "where the dust devils dance whirling into a wide, pale sky." So she told the story of the desert.

"When I was too sick to do anything else I could lie out under the sagebrush and look," she went on, "and when I was able to get about I went to look at other things, and by and by I got to know when and where looking was most worth while. Then I got so full of looking that I had to write to get rid of some of it to make room for some more. I wrote the book, 'The Land of Little Rain,' because I could not help it. I wished very much to tell somebody about it, and I felt sure there must be people who would feel about it as I did. I did not personally know any such people, nor did I know how people of the sort I imagined as being interested in it, would talk. I just wrote as I felt and nobody was more astonished than I to discover from the reviews that the book had 'style.'

"I wrote the book in two sessions of about three weeks each, but I was twelve years getting ready to write it.

"When I lived in that country I rode horseback everywhere. I gave up riding when I went to New York; it was too stupid just trotting around a park. Here in New Mexico I have to resort to the motor, because the distances are too great for horseback riding."

It was twenty years ago when she wrote the volume "A Land of Little Rain," and it is still selling. The tired and eyesore traveler has it offered him on the trains and the community leaders of the Southwest know it as their geography. Into it has gone the parch of the desert, the drear of monotonous weather, the heat of the dry summer day and its drifting sands, the moping form and horrid croak of the buzzard; the coyote coming out of his lair for killing in a country of carrion crows, first looking up to see where they may be gathering; Indian women gathering willows or weaving baskets around the campoodie; the byways and river canyons of the mountains that lead upward toward the citadel.

In at least a half-dozen other books she has repainted the story of this strange land. She loves it as does the land-locked sailor the sniff of salt breezes.

"If one is inclined to wonder at first how so many dwellers came to be in the loneliest land that ever came out of God's hands, what they do there and why stay, one does not wonder so much after having lived there," she once wrote. "None other than this long brown land lays such a hold on the affections. The rainbow hills, the tender bluish mists, the luminous radiance of the spring, have the lotus charm. For one thing there is the divinist, cleanest air to be breathed anywhere in God's world. Some day the world will understand that, and the little oases on the windy tops of hills will harbor for healing its ailing, house-weary broods."

Every year Mrs. Austin spends a part of her time at one or another of the Carnegie Botanical Laboratories, so that all she writes of out-of-door life is subjected to rigid scrutiny. She declares that her love of nature was born with her and that her earliest recollections are impressions of its beauty and mysteries, always inseparable from religious emotion.

The Southwest country has been portrayed in her book, "The Land of Little Rain," the shepherds in "The Flock"; the Indians in her childlike stories of "The Basket Woman" and life in the old missions in "Isidro."

The late President Roosevelt was so interested in "The Flock" that he sent a man to Lone Pine to interview her on the problems of sheep and forest conservation. From this literary acquaintance grew their mutual respect for each other, because of their love of the land.

Other themes upon which she has written are "The Man Jesus," "The Man Who Didn't Believe in Christmas," "Christ in Italy," "Woman of Genius" and "The Young Woman Citizen."

"When I am not writing, which is from two to three months every year, I live as hard as I can," she continued. "Frequently I take another name and go somewhere and live a life as utterly different as it is possible, down on the East Side of New York, in an Indian village, on a Middle Western farm."

And with a smile that broke the accustomed Indian stoicism of her demeanor she added: "Once I cooked for a Long Island millionaire—made all the desserts and salads."

"I am incurably domestic in my tastes, am an excellent cook and adore having company and making a garden," she went on. "This is a great misfortune if you find yourself elected to a literary career. I have wasted more time over cooking and housekeeping and trying to live in one place than any other thing. I have to fight this domestic tendency to this day. If I had a daughter who seemed to be intended for an intellectual or artistic career, I should take good care to see that she didn't acquire a taste for housekeeping and needlework. When the temptation gets too strong for me now, I borrow a kitchen and put in a week or two making jam and jelly. I go on a regular jag of cooking and get it out of my system.

As the head of the department of aboriginal literature in the school of American research at Santa Fe, Mrs. Austin has made a thorough study of the Indian.

Wind Storms of the Desert

By MARY AUSTIN

ALL storms of desert hills, except windstorms, are impotent. East and west of the Sierras they rise in nearly parallel ranges, desertward, and no rain breaks over them, except from some far-strayed cloud or roving wind from the California Gulf, and these only in winter. In summer the sky travails with thunderings and the flare of sheet lightnings to win a few blistering big drops, and once in a lifetime the chance of a torrent. But you have not known what force resides in the mindless things until you have known a desert wind. One expects it at the turn of the two seasons, wet and dry, with electrified, tense nerves. Along the edge of the mesa, where it drops off to the valley, dust devils begin to rise white and steady, fanning out at the top like the genii out of the fisherman's bottle. One supposes the Indians might have learned the use of smoke signals from these dust pillars as they learn most things direct from the tutelage of the earth. The air begins to move fluently, blowing hot and cold between the ranges. Far south rises a murk of sand against the sky; it grows, the wind shakes itself, and has a smell of earth. The cloud of small dust takes on the color of gold and shuts out the neighborhood, the push of the wind is unsparing. Only man, of all folk, is foolish enough to stir abroad in it.

—From "A Land of Little Rain."

Bulls and Bears of Early American History

Visions That Became Real and Prophecies That Went Astray

By JOHN T. FARIS

IT IS natural that, in the midst of the many wonderful developments of recent years, Americans should wonder what people who lived fifty, one hundred, two hundred years ago would think if they could see the country as it is today.

In a measure this natural curiosity can be satisfied, for, even if it is impossible to bring the Americans of yesterday into the surroundings of 1923, it is easy to find the records of what some of the people thought as they projected themselves forward into the future. Many of them were true prophets. Some were extravagant in their prophecies. But those who were too optimistic had for companions, as happens always, others who were gloomy pessimists.

One of the early optimists, who projected himself into the future with pleasing hopefulness, was named Philip Fithian. An old document tells of his visit to the Tuscarora Valley in the mountains of Pennsylvania in 1775, and of his meditations as he sat one day on the banks of the Juniata:

"Fair genius of the water, wilt not thou, in some future time, be a vast, pleasant and very populous country? Are not many large towns to be raised on these shady banks? I seem to be transferred forward only one century. Great God! America will surprise the world."

Another glimpse of refreshing optimism is provided for those who look at the early days of St. Louis. In 1765, when Pierre Laclède Ligueste selected a site for a trading post for Maxent, Laclède and Company, he said that on the site would rise a settlement "which might become hereafter one of the finest cities in America." The growth of the new post was so rapid that in 1811 H. M. Brackenridge declared it would become "the Memphis of the American States." And the people of this Memphis have always had magnificent faith in themselves and their destiny. In 1870, by order of the county court, a book was published entitled, "St. Louis the Future Great City of the World." In this, James Parton was quoted as saying that St. Louis would be the future capital of the United States, and of the civilization of the Western Continent. Horace Greeley, so the volume declared, spoke of the city's predestined station as "the first inland city on earth."

Twenty-three years after the founding of St. Louis, an optimist encountered two pessimists, his own partners. John Filson was the optimist, and Matthias Denman and Robert Patterson were the pessimists. In 1788 the three men laid out a town which they called Losantiville—"the town opposite the mouth of the Licking," as the name meant. Filson's faith in the future of the infant settlement has been put into verse by an Ohio rhymster:

> "Said Filson, 'Comrades, hear my words:
>   Ere threescore years have flown,
> Our town will be a city vast,'
>   Loud laughed Bob Patterson.
>
> "Still John exclaimed, with prophet tongue,
>   'A city fair and proud,
> The Queen of Cities of the West.'
>   Matt Denman laughed aloud."

The birthday of Indianapolis was not until 1821, but the infant community was favored with a man of vision who insisted on laying out a plot for a city a mile square. Soon an enemy of all optimism came along, who spoke of this as "a ridiculously large plot." Yet he had grace enough to add his prophecy that the town "would eventually fill the entire space!"

This view of the Klamath project was taken from the slope of Mount Stukel, looking across the valley.

In the sand-hill region of Nebraska, the United States Forestry Service is reclaiming the vast area by field planting. The illustration shows seven-year-old jack pine.

Photo by U. S. Forest Service
A blow-out one-half mile southeast of Bessey Nursery, Nebraska, in 1919 planting.

Pike's Peak auto highway, Pike National Forest, Colorado.

The very year that saw the beginnings of Indianapolis witnessed a historic real estate transaction near the shores of Lake Michigan. Three thousand Indians, gathered by the Chicago River, sold to the government ten millions of acres of land in Michigan and Illinois, including the site of Chicago, for five thousand dollars. The first house in the future city was built in 1833, and the same year a hopeful citizen, after watching the erection of a government pier, said: "If the pier now building should be a permanent one, and the harbor become a safe one, Chicago would undoubtedly grow as rapidly as any of the western villages."

The older of the Twin Cities on the Upper Mississippi dates from 1841, when St. Paul's Landing was named. In 1849 a regular line of steamers plied between the Landing and points down the Mississippi River. One of the spring boats brought word of the birth of Minnesota Territory, which then had 4,780 population. Five years later a traveler spoke of St. Paul as perhaps the best specimen to be found in the state of "a town still in its infancy with a great destiny before it." Later a boastful citizen said that St. Paul was the natural capital of the territory "from Lac qui Parle to the Missouri, from the Mississippi to the Red River of the North, from the Red River to Lake Superior, and from Lake Superior to the Mississippi." Modest, wasn't he?

St. Paul was six years old when St. Anthony Falls was born. In 1854 a visitor said it was "a picturesquely situated town—a cheerful, pretty place, clean and well-built, containing about twenty-five hundred inhabitants." At about the same time the citizen of St. Paul who had spoken so enthusiastically of the prospects of his own town, said of the people of St. Anthony: "In our opinion, the ultimate hope of the town for a large population rests upon that class of retired people of substance, as well as invalids and people of fashion, desiring library privileges in a retired, beautiful town."

This individual paid his respects to All Saints, the town that was just beginning to make a place for itself on the west side of the river, opposite St. Anthony Falls: "All Saints, or Hennepin, or Minnehaha (what a pity they cannot find a name for the place!) is in all respects as pleasantly situated as St. Anthony, for mill purposes, and will soon be a flourishing village."

The two "villages" thus described by a man who tried to be loyal to his own town were visited in 1872. The new town might have been called Albion, or Brooklyn, or Lowell, but the suggestion that the name be Minneapolis—the city of Minnehaha — was adopted, one letter being dropped for the sake of euphony.

In early days prophecies were plentiful all along the Mississippi River. One was made by Timothy Flint, an English traveler, who marvelled at Tower Rock in the river some distance below the site of old Kaskaskia, first capital of Illinois Territory. He described the rock as "a noble and massive pyramid, rising precipitately out of the bend of the river, and stated to be one hundred and fifty feet high."

In 1839 Colonel William Bowie Cowan grandiloquently told of his belief that Grand Tower—which is now a village on the river close to the rock—was destined to become a great city, because "on the whole length of the river, from the Falls of St. Anthony to the Balize, it is the only point that presents an impregnable barrier to the raging flood." Believing that Tower Rock, not far from the center of the stream, "offers itself as one pillar of the bridge that is to connect the Egypt and the Ophir of the great valley," he received a charter for such a structure, and was eloquent in his declaration that it would be built, since that was "perhaps the most rich spot of country known in the world."

But the bridge was never built, and the greatness of Grand Tower failed to materialize.

Such optimism is a good foil to the pessimism of Gouverneur Morris who, soon after the Revolution, advocated giving up the mouth of the Mississippi to Spain. "What good will it do us?" he asked. "Everybody knows that the rapidity of the current will forever prevent ships from sailing up, however easily they may float down. Now, unless some dragon shall be found whose teeth, sown on the banks of the Ohio, will produce seamen, I know not where else they will be obtained to navigate ships abroad, which can never return home."

As emigrants passed to the West they found that Gouverneur Morris was wrong. But even they were wrong in their prophecies concerning some of the lands they passed by with a shrug.

For instance, they thought unworthy of notice the territory that is now included in Michigan. They had been told that for many miles north of the Ohio there was nothing but a tamarack swamp; that not one acre in a hundred was worth anything. Still more surprising is the fact that, in 1835, when Michigan sought admission as a state and was offered the Upper Peninsula in exchange for her claim to a strip of Northern Ohio, containing less than five hundred square miles, there were so many who believed the Upper Peninsula valueless that they were ready to fight for the paltry bit of Ohio. In 1834 Delegate Lyon voiced on the floor of the House of Representatives the contemptuous belief of his territory when he declared that no one wanted the Upper Peninsula, because "for a great part of the year nature had separated the two peninsulas by impassable barriers." So it came to pass that the authorized Constitutional Convention, held at Ann Arbor

(Concluded on page 13)

A Few Facts You May Not Know of Scotland

"Caledonia Stern and Wild" Not So Stern or Wild in This Day

By VICTOR MITCHELL

"CALEDONIA stern and wild" has not lost its fascination for the visitor or tourist or pot-hunting sportsman: but, generally speaking, it is neither stern nor wild. True, there are lots of brown heaths and shaggy woods, but the mountains are mere molehills compared to the Rockies, for example, and as for floods, there is nothing in Scotland that can compare with the upheavals which occur on this continent when the warm spring sunshine has melted the winter snows and torrents come tumbling down the valleys carrying all before them. But tradition has woven a web of romance about this land of Bruce and Wallace and Scott and Burns, which even Lauderian lilts and fantastic jingles cannot banish, because the typical Scot is a very different individual from the funny little man with the crooked stick and the scanty kilt who is always singing about "bonnie purple heather" and "bonnie lassies."

Stephen Leacock, that prince of humorists, in one of his burlesque narratives, depicts a barefooted "Heilan" lassie as paddling in a burn or mountain stream catching lobsters which she disposes of to Sassenach tourists, for a consideration. This is a farcical picture, but not more so than some of the conceptions the outside world has formed of the average Scot and the conditions under which he lives.

The popular notion that every Scotsman wears a kilt as a sort of a religious duty is even harder to kill than the idea that every Chinaman's soul is damned if he parts with his pigtail.

Once upon a time, not so very long ago, every Englishman, every Southerner, every foreigner of whatever nationality who came to Scotland deer-stalking or grouse-shooting, considered it the correct thing to wear a kilt, and just a year or two before the war the inhabitants of the "douce" town of Nairn—famous for its dry climate and golf course—were surprised and startled to see a Chinaman swaggering about with an air both bland and benignant arrayed in the full panoply of the tartan philabeg. A Chinaman in a kilt was to them as fantastic an object as would be a redheaded Highlander appearing in the streets of Canton wearing a pigtail.

Of course, Scotsmen are proud of their national dress—"the garb of old Gaul"—and all that it stands for, but they have strong notions as to the fitness of things, and the kilt can no more displace the trews as a utilitarian garment than the bagpipes can take the place of the piano as a drawing-room instrument.

Besides his "dourness" and his fondness for the kilt, there is another attribute which is popularly supposed to be characteristic of the Scot, namely, his "grippiness," his "nearness," his tendency to shed regretful tears when he parts with a coin even of the lowest denomination. The story of the Scotsman who had not been in London "five meenits" when "bang went saxpence" is almost as familiar as the legend that the only Jew who ever came to Aberdeen starved to death. But I have lived in the Granite City and am in a position to refute this slander. Supposing it to be true that this wandering Hebrew met with such a cruel fate, the consequences must have been much the same as when a too venturesome fly gives up the ghost on a sheet of tanglefoot; scores of others must have come to the funeral and stayed afterward.

For the past twenty years or so the Jewish community in Aberdeen has flourished like the green bay tree. They have their rabbi and their synagogue complete, and the principal street of the city is lined with their palatial emporiums in which, among other merchandise, there are offered for sale cheap jewelry, dry goods, furniture, tobacco, and what not, and it takes all the hard-headedness of the native citizen to keep himself from being pushed into the back streets, as far as business is concerned. It would be a very barren soil indeed where the Jew could not flourish, and Aberdeen does not provide that kind of soil.

Not only in Aberdeen but in all the larger cities in Scotland the Jew is obtaining a firm hold of things. Very frequently it is as a "financier" that he builds up his fortunes, and money-lending advertisements have become quite a feature of the Scottish newspapers. But when engaged in this business of "big interests" the Jew is as a rule too wary to trade under his own name, and disguises his racial identity under a cognomen calculated to sound pleasantly on the native ear.

Quite recently a Hebrew gentleman appeared before a Glasgow magistrate in connection with a business deal the integrity of which had been challenged, and gave a foreign-sounding name somewhat like a cough and a sneeze combined. "What," exclaimed the astonished bailie, "I thought that all the Jews in Scotland were named either Gordon or Campbell!"

It is hard to say what steps the gay Gordons or the ancient and powerful clan of which the MacCallum Mohr is the chief ought to take in a case of this kind, but it is a fact nevertheless that the camouflaging of Semitic ancestry under good old Scottish names is quite common, and at present there appears to be no legal means to stop it.

There arise occasions, however, when the Celtic blood is stirred to indignation by real or fancied breaches of the canons of tradition. Lord Leverhulme, of Sunlight soap fame, who has become proprietor of a large part of the Hebrides, including the Island of Lewis and the town of Stornoway, has recently assumed the title of "Lord of the Isles." This assumption of a name so famous in history has proved too much for various Highland organizations and societies, who have vigorously denounced it as an act of presumption and an outrage on Celtic tradition.

Leaving for America

A FEW weeks ago it was my lot to witness the embarkation on one of the huge Atlantic liners of several hundreds of those men from the "lone shieling of the misty island." A public holiday had been proclaimed in Stornoway and the little town was teeming with excitement. Across the broad bay on which the big ship rode at anchor the Highlanders were transported in a local steamer in the wake of which there followed a flotilla of motor launches crowded with the friends of the braw lads about to seek their fortunes abroad.

On the green braes which surrounded the harbor and on the encircling hills beyond, other groups were gathered to cheer the departing emigrants or to wave them a last farewell. To do honor to the occasion the pipe band of the town turned out to a man and played inspiring airs as the tender lay alongside the ocean leviathan. Old Jacobite tunes were these, including the stirring strains of "Ower the watter tae Charlie," and when at last all were safely on board and the anchor raised, cheer after cheer came from the brave hearts left behind—fathers, mothers and bonnie lasses trying to smile through their tears. At last the vessel got under way, the notes of the pibroch died in the distance, the sun became a glowing beacon in the west, and hopeful faces turned toward the broad Atlantic.

Another aspect of Scottish character is associated in the popular mind with the inordinate consumption of "barley bree." There is, of course—with the exception of one or two infinitesimal specks on the landscape where the provisions of local option have been taken advantage of—no prohibition in Scotland, and never will be. The Scot loves his freedom too well to part with it in this fashion. He has no desire to indulge in the wine of the country at all times, but he wants to be in a position to do so when the spirit moves him.

Once upon a time a certain satirical Sassenach in describing what he alleged to be a typical Scottish landscape wrote as follows:

> "The whisky stills, the Heilan' stirks,
> And a' the bonnie Wee Free Kirks."

Thus embracing three of the country's principal products—good liquor, good beef and sound religion.

But in spite of the whisky stills, temperance (not prohibition) is undoubtedly gaining ground. Lessons learned from the control of the liquor traffic during the war have been turned to advantage, and shorter hours for the opening of licensed premises, and dearer and weaker whisky, have had their effect in keeping the people sober. The traffic in bootlegging products which is baffling the authorities in this country is almost unknown.

There is a well-worn jibe which declares that a Scotsman keeps the Sabbath day—and everything else that he can lay his hands on. He does keep the Sabbath day, but not in the fashion of his forefathers. It is certainly a day of rest and of religious refreshment, but it is also a day of bodily recreation. The advent of the motor car and the motorcycle has made long excursions into the glens and woodlands a delightful possibility; and the seashore with its wonderful rocks and caves and its pleasant stretches of sandy beach is always within reach.

So firmly has the precept that the Sabbath was made for man and not man for the Sabbath taken hold in Scotland that the sour, dour type of Sabbatarian has been driven into the wilderness. Sunday cars, Sunday golf, Sunday football, and the opening of museums, art galleries and public parks on Sundays—all of which would have been anathema to a former generation—have greatly changed the aspect of things. It is even the case that in the time of harvest when abundant crops await the gathering in and weather conditions are unsettled, rather than run the risk of losing good food supplied through the bounty of the Almighty, a fine Sunday sometimes means the Sunday harvesting of the corn or barley, ministers themselves looking on with approving eyes.

Ian MacLaren's "Bonnie Briar Bush" supplies a very faithful picture of conditions as they existed in Scotland in a former generation, but they are not true of Scotland today. The other week a certain laird in that part of the country in which the "kailyard" scenes are drawn, announced that he was prepared to present a public park to the people on condition that football was allowed to be played in it on Sunday afternoons, and although a sharp difference of opinion has arisen over this matter, the laird is likely to carry his point.

But there is not the slightest danger that the Scottish Sabbath will become commercialized, despite all this slackening off in the rigidity of a former age. There is a difference between humanizing and commercializing the Sabbath. It merely means that after those periods of upheaval and susceptibility to extraneous influences which afflict the most cultured and intelligent of nations from time to time, the Scot is arriving at that Elysium known as "the happy medium," for moderation in all things is another of the fundamental characteristics of the Scottish nature. The blending of the Celtic and Scandinavian bloods, with a judicious touch of the Saxon, has saved him from being an extremist, but, nevertheless, where cherished principles are involved he will fight with all the stern resolution of his forefathers.

What better thing could Douglas Haig have said when matters looked black for the British army in France—an army of which the Scots formed no inconsiderable proportion—than this:

"My men, your backs are at the wall." It was this which aroused the indomitable spirit within them which ultimately carried all before it. It is in this same spirit that the Scottish people have fought for the sanctity of the Sabbath when alien influences have tried to turn them from it, and having gained their point they can afford to expand a little and admit in due proportion those humanizing factors which are making the Scottish Sunday a real day of rest and recreation both for mind and body.

On this day the fishing fleet lies snugly in the harbor, the farm horses rest in the green fields, and the smoke pall which hangs over the hives of industry throughout the working week gives place to the serene and unclouded glory of God's sunshine.

Bulls and Bears of Early American History

Concluded from page 12

in 1836, rejected the proposal on which statehood depended. When the governor refused to call a second convention, five citizens acted in his place, and succeeded in having the proposed boundaries ratified. Congress recognized the unauthorized convention, and Michigan became a state, with 22,600 miles of the Upper Peninsula hung, as many thought, like a millstone around its neck.

Yet less than eight years later came the first discovery of iron that opened the eyes of doubters to the value of the Upper Peninsula. Since then the development of the Iron Ranges has been so wonderful that only the opening of the copper region that extends from Keweenaw Point down to Wisconsin can be compared to it.

In time prophets began to pay their respects to the Great Plains that swept westward and upward toward the Rocky Mountains. These, they declared, were as valueless as Gouverneur Morris thought the Lower Mississippi. In 1859 Edward Everett Hale said of one bit of the Plains region, the twenty thousand square miles included in the Sand Hill district of Nebraska: "It is wholly useless for agricultural purposes, and must remain so forever." And his pessimism seemed justified, for all was a jumble of hills that would not stay put. The country was ever on the move; like the waves of a choppy sea the hills rose and fell. Sometimes bits of vegetation, clinging to the slope, succeeded in giving a semblance of permanence to the sandy foundation. But let a burrowing gopher disturb the vegetation, and the wind would scoop out the sand from the top of the hillock and form a curious blowout.

But those who were dubious as to the future of the sand hills were wrong. In 1905 a man of vision in the United States Forest Service had an inspiration; he felt sure the sand hills were capable of growing sufficient timber for the needs of that western region. So jack pine seedlings, brought from eastern states, were thrust into the ground. They grew. The area was made a national forest, with headquarters at Halsey, on the Middle Loup River. Plantations were started. Experiments were continued for years. And now, in the midst of the otherwise barren landscape of a cattle country, there is a real forest.

The day came when wanderers across the Plains made their way to the present site of Denver, where they dared not only to dream of a city, but even to make a beginning for their dream. The first issue of the *Rocky Mountain News,* one day in April, 1859, thus made its grandiloquent bow to the young settlement, Denver:

"Where a few months ago the wild beasts and wilder Indians held undisputed possession; where now surges the advancing wave of Anglo-Saxon enterprise and civilization; where soon, we fondly hope, will be erected a great and powerful state, another empire in the sisterhood of empires."

Less than a century ago men would have laughed at the idea of applying to the Valley of the Columbia River the term, "Inland Empire." There were few who had a good word for the vast area that has since given to the country some of its most fruitful land. In 1837 Thomas J. Farnham wrote:

"Above the Columbia there is little worth-while land. The forests are so heavy and so matted as to require the arm of a Hercules to clear a farm of one hundred acres in an ordinary lifetime; and the mass of timber is so great that an attempt to subdue it by girdling would result in the formation of another forest before the ground could be disencumbered of what were killed."

Six years later, when Congress was asked to take steps to secure the Oregon Country for the United States, Senator McDuffie declared that he would not give a pinch of snuff for the whole Oregon country. Another Senator was reported as saying:

"We are nearer to the remote nations of Europe than to Oregon."

In 1825 Senator Benton made a declaration that was quoted in Congress as late as 1844:

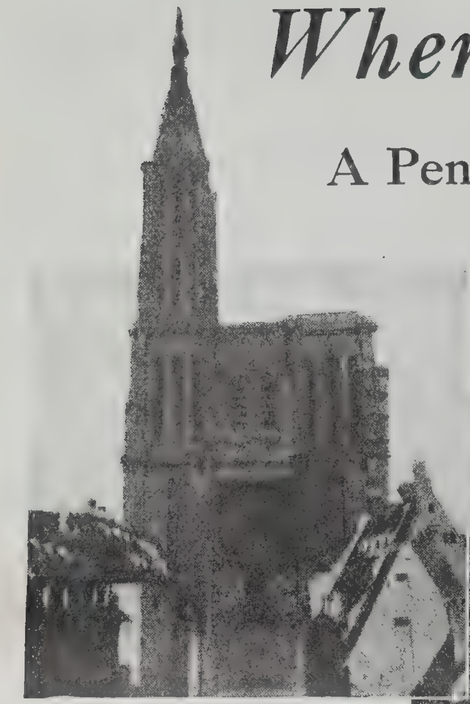
"The ridge of the Rockies should be forever a national boundary."

Probably the citizens of 2023 will be smiling at the predictions we make, even as we of today smile at the words of seers in the early days in America.

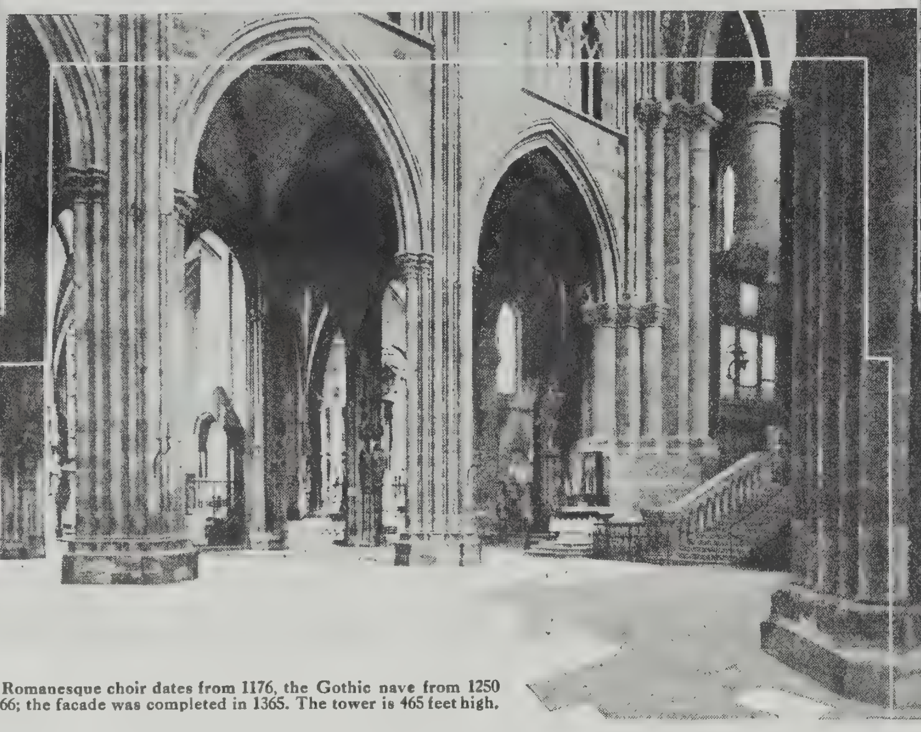
Where France Is Supreme

A Pen Picture of Strassburg, Again Wrested by Gauls from Germans

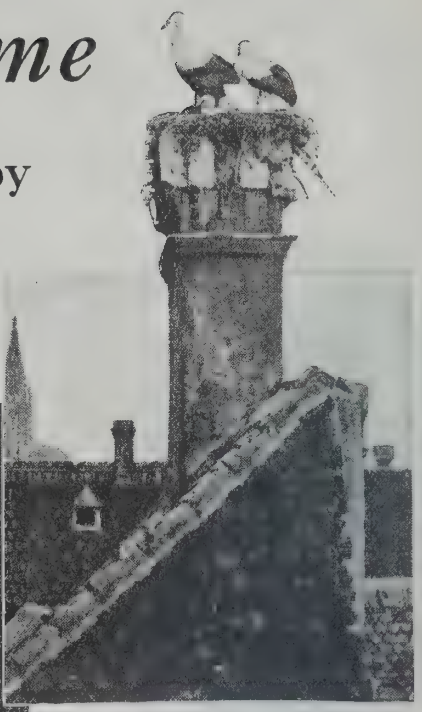
By WILLIAM ATHERTON DU PUY



The Strassburg Cathedral, said to have been founded about 1000.



The Romanesque choir dates from 1176, the Gothic nave from 1250 to 1266; the facade was completed in 1365. The tower is 465 feet high.



Strassburg is famous for its storks.

THERE they stood, the three of them, huge, heroic figures in stone, proudly astrut with their backs to the wall of that modern and imposing structure, the post office building of Strassburg. There was assurance in the planting of their sturdy feet, dominance in every line of their pompous figures, for did they not represent three generations of rulers who insisted that their right was divine—the Kaiser, his father and grandfather—the mighty of the line of Hohenzollern. Sturdy of torso they were, but alas! the three of them had not one head among them. Each had been neatly decapitated. And there they stand in this town which is again French, mute reminders of the unwelcome dominance that was and the feeling of the populace toward it.

One comes down to Strassburg from Basel, in the corner of Switzerland, between the valley of the Rhine and the Vosges range yonder to the left, with ruined castles atop the spurs that jut into the plains. Those castles were occupied by proud barons when the Romans marched this way 2,000 years ago and captured the Celtish town that is now the happy capital of Alsace-Lorraine. It is still an odd seeming country to the American, for you ride on endlessly through carefully cultivated acres, yet on none of these farms is there evidence of human habitation. Not one of them has a house, a habitation of man, upon it.

You rub your eyes curiously and scrutinize the plain that rises toward the mountains. Ah! Yonder are the houses. They are in dense clusters. You can see three clusters from where you are, some two miles apart, gray, solemn, medieval. They are closely built towns abruptly terminated and then the homeless country.

This method of life is a survival of the system which existed when vassals lived within the walls and went forth guardedly for their tillage. Farmers still live in villages and go out to their fields. It is a very old system. Strangely, the community center theory of modern model colonies goes back to it.

Strassburg is a busy city of nearly 200,000 persons, with a core that is made up of crooked streets and Frankish houses with sagging tile roofs that are a thousand years old, and a spacious modern section that has been built largely during the German occupation since 1871. You ride out two miles to the bridgehead and look across the Rhine into Germany. There are huge fortresses all the way and French soldiery where Germans used to be. It looks very quiet on the other side. There is no travel across the bridge. You tread quietly, speak softly, fearful that any spark may set unseen fuses to sputtering.

The Strassburg Cathedral

SO MANY things have happened in these old towns. Consider this Strassburg Cathedral, one of the masterpieces of the world. I believe this is the tallest of all the cathedral towers, 465 feet, I am told. They began its building in 1015. This screen of double tracery in the front of it, these doorways, draw connoisseurs from all over the world. It is an architects' shrine. The humble dilettante feels a great emotion within him as he gazes, the dumb emotion of a member of a race which has lost the capacity to build as once it did, but not the capacity for appreciation.

The town of Nancy is in a bit of a back eddy there in the east of France. Not many Americans penetrate that far. Not even the concierge at the hotel can speak English. Here you discover an odd thing, that this town of Nancy gave the toothsome macaroon to the world. Two hundred years ago the Macaron sisters ran a little baking shop up a side street and they made a delicacy so palatable that it has carried their name to all parts of the earth. Thus potent is even a small task well performed.

It is a bit of an adventure to drop into one of these back towns, knowing nothing of it, late of a Sunday afternoon, for instance. It was thus that I came to Nancy. It was a walk into the unknown when I strolled up the main street, a street teeming wildly with a bubbling throb of life. Sunday at eventide, it would seem, is the liveliest hour of the week in Nancy.

It is interesting to note the things that are being done that are taboo in the United States. There are innumerable cafés which are no more than establishments for vending drinks, as food hardly appears. Men, women and girls go inside and sit around the bars in a manner that was never dreamed of in our wettest days. Then the proprietor pushes his tables out onto the sidewalk and almost blocks it. It is an addition to his table space. There is no municipal objection. It is the most important space he has. The tables on the sidewalk are filled first. There are fifty tables so filled in front of this one café. The throngs pulse back and forth. It is almost a carnival scene. Two boys of ten bustle up and buy handfuls of cheap cigarets. There are men in uniform everywhere. One is surprised wherever he goes in France at the abundance of uniforms. France is determined to maintain an army until she gets guaranties from attack such as Britain and the United States agreed to when she relinquished all claim to the east bank of the Rhine, but later refused to ratify. These quiet back towns are quite full of men in uniform.

The Coils of Rusty Wire

YOU pass through the throng to a quieter section and come upon a solemn cathedral which looks familiar and which you afterward find to be a reproduction of Saint Andrea della Valle, in Rome. And then an ancient, medieval gate like the end of a tunnel running under what was once the town wall, a gate the like of which there are seven at different approaches.

I turned up a side street by chance and walked into a fairyland. This is Place Stanislaus which was built after the style of Versailles, of Louis XVI, by Stanislaus, former king of Poland, and last of a long line of dukes who ruled here. This square abounds in monuments and fountains, is fringed by stately public buildings and the palaces of the dukes, and its gateways are guarded by archways of grilled iron gratings. The triple gateway of a stupenduous triumphal arch leads out to the north into the Place de la Carriere where lanced knights of old were wont to hold their tournaments, and beyond stately government buildings, more ducal palaces, quite exquisitely done, tall Gothic churches, and the old town that dates back to Caesar.

And as I stood there in the glooming twilight beneath this classic arch the most preposterous thing happened to me. My mind suffered the most vicious wrench to which a mind was ever subjected. Absorbed as it was with a contemplation of the exploits of Charles the Bold who twice captured Nancy and then met death beneath her walls, it was brought back to modern actualities by the rasping voice of a stout, middle-aged, American woman tourist who made in a most commonplace way the most harrowing and sensational statement I have ever heard uttered.

"And so," said the stout woman, "she put a razor blade in his hairbrush."

A razor blade in his hairbrush! There was an idea with which the imagination might vigorously exercise itself—upon which it might hang various sequences. A strange place, surely, in which to pick up so incongruous a thought!

One does not see much of war devastation when he comes down from Strassburg to Nancy. There is the point where coils of rusty wire trail away through the grass and give a reddish tinge to the landscape. They are the entanglements of the old battle line but the fighting was not great here. It is far different from the point through St. Quentin, as you come down from Brussels to Paris and ride for 50 miles in ruined country that has gone back to the wilds.

But as one journeys from Nancy to Verdun he touches St. Mihiel where the Americans cut off the German salient and there sees plenty of wreckage and gains his first look at rehabilitation—those formal and stereotyped houses that the government is erecting to take the place of those that are gone. Yet if one would get, in a single picture, the idea as it is best written today of what happened when war was at its maddest, he need visit only Verdun.

There is a new station down where the train stops, a squat spreading station like the new towns have out west. The street to the town leads over temporary lumber bridges, contrasting grotesquely with the remaining fragments of the St. Paul gate of the time of heraldry. And one finds himself in the strangest of towns.

Lining the streets are temporary wooden shacks occupied by shyster merchants selling shoddy goods just as they are found in the boom mining towns in the days of a gold rush. There are frame hotels that have gone up in a week untouched by the mollifying influence of fire regulations. Sidewalks have disappeared and stones and bricks litter the streets. The bark of the vender and the fakir compete with the rattle of hammers. There is much hurrying to and fro in grimy apparel that suggests the constructive calling of the wearers. There is intense activity, for this is a boom town with 14,000 houses to be built to take the place of those that are gone.

It is a mile across, this ruin, a round hill with an ancient cathedral at its top. When the time of stress came the town was not so different from what it had been back in 843 when the treaty was signed here that parceled out the empire of Charlemagne, so old and substantial are these stone-built towns of France. When the fighting was over there was little left save the subterranean caverns of the citadel in which stood Marshal Petain when he said *"they shall not pass."*

On the Battle Field

ONE rides out, of course, to the battle field, this four square miles that has drunk more human blood than any other area ten times its size since the world began. One had not just got the idea that the forts were some five miles out, that the fighting was not under the walls of the town. There are rolling hills around Vaux and Douaumont, much like those of Virginia across the river from Washington. They used to be covered with trees before the fighting but not one living thing, twig or insect, save man, remained to the end. Captured and recaptured were these forts, Douaumont sixteen times.

One stands there on the crest of a ridge. Here four hundred thousand Frenchmen went forth to die and in doing so took with them six hundred thousand Germans. A million men perished in four square miles. In that area still rests the fragments of what once went to make them what they were. The bodies of but few were ever recovered. That shower of shells rent and tore them limb from limb.

Back yonder in this corner of France where the Cote-d'Or, that golden shore, runs down to kiss Dijon, the peasants sing as they gather their grapes which alone will yield the sparkle that is peculiar to the wines of Burgundy. Unless they sing, the legend says, the vintage will go flat, for the joy of the wine gets into the bottles only by flowing over from the wells of it that fill the hearts of the sons and daughters of France. Knowing which I solemnly pledge, and ask you to join me in it, that, now and hereafter, if wine of the Cote-d'Or, as bitter as gall, is served me in a dirty cup and with a curdling scowl anywhere under the sun, I will remember Verdun and the peasant's sorrow and gulp it down without complaining.

Fur Ring, Linked With U. S., Threatens All Seals

Concluded from page 2

reconsidered its recommendation that the ten per cent excise tax on manufactured furs be retained in the new tax bill, and that it is now in favor of having the tax eliminated entirely.

"THE ENTRANCE OF SENATOR SPENCER, OF MISSOURI, INTO THE FIGHT SEEMED TO BE THE TURNING POINT IN THE VICTORY FOR THE FURRIERS.

"It was through Colonel Philip B. Fouke, of St. Louis, that Senator Spencer was induced to go before the Senate in behalf of the fur industry."

October, 1921, is also the month in which a group of St. Louis men visited Washington and with Senator Spencer as spokesman presented Mrs. Harding with a sealskin coat made of the Fouke skins. While it was a gracious thing, the incident resulted in national publicity or distribution of a picture showing Senator Spencer and officials of the Department of Commerce, but not a single St. Louis donor.

This was evidently a good month for the St. Louis law firm of Spencer and Donnell, attorneys for Fouke interests, from whom they received $3,800.63. But why muzzle the ox that treadeth out the corn?

Ward T. Bowers, field assistant of the Bureau of Fisheries, testifying before the Senate Commerce Committee, very defiantly said they were not reserving the five thousand breeding seals, according to the law. He made it plain they had no intention of obeying the law, saying they were making a "theoretical reserve."

Dr. David Starr Jordan, who investigated the seal business more than twenty-five years ago, was before the committee for a few minutes. He said: "I think the dealings with this St. Louis firm ought to be put on a higher plane."

He also said he thought the work now being done on the islands by Fouke's men should be done by the government. Of course it should. The present arrangement was never contemplated when the new law was passed.

Senate Bill No. 3731, which embodied Mr. Elliott's views, would prohibit the taking of any sealskin which should measure less than thirty-seven and a half inches long in the salted raw state. This would stop puppy slaughter on the basis described in this article. The bill also makes it mandatory for the Secretary of Commerce to sell the skins in the salted raw state, which would prevent the government continuing with the dressing, dyeing and sales contract with the international group's concern.

Why not take the Alaska fur-seals out of the control of a department that has blundered and been misled, and its bureau, which has no standing with respectable authorities upon the subject with which it acts the scientific clown? Why not put it in the hands of a commission composed of representatives of the Campfire Club, who led the good fight; the American Museum of Natural History; a representative of Canada, whose confidence in us has been misplaced, and of the Department of Commerce and also Henry W. Elliott, but for whose cries the Liebes and their associates might have rendered the seals extinct by this time?

Pinchot Politics in Pennsylvania Prison

Concluded from page 8

new overseers at a living wage, he had in his hands the report of the April Grand Jury, the report of Doctor Potter, and the result of two visits of inspection which he himself made at the prison. The Governor is deeply read in sociology and economics. He knows that in Philadelphia a man cannot keep a family on $1,300 a year. He knew—since it was his duty to appoint the Board of Prison Inspectors—that the guards had not been paid for a month, on the day he celebrated the Fall of the Bastile by vetoing some bills and reducing living wage appropriations in others. Of course, since the Governor is a very wealthy man by inheritance, it is only fair to state that he probably didn't think of the needs of poor men.

The Governor knew that under the régime of the Four Horsemen a plan had been made for a general jail delivery, and that only the intervention of the Grand Jury and the formation of the special squad of heavily armed police prevented it. He knew, or could have known, that several other plots to escape were in the making at the jail. The night before the six convicts escaped Philadelphia police were warned that the break was to be made. Several motor cars filled with detectives were sent to keep order in the prison that they are not allowed to enter, and the convicts, apparently hearing of their arrival, postponed the break until daylight, when they had to contend only with guards and officials subject to the dictates of Governor Pinchot.

Some citizens, confident of their ability to take care of themselves and to protect their own homes from bandits and murderers, have been laughing openly at the spectacle of the great state of Pennsylvania under her reform Governor, placidly standing by and doing nothing while six killers are turned loose on the country. One of them went to the length of writing a letter to one of the newspapers saying that he didn't blame the convicts at all, and expressing wonder at the meekness of the prisoners who remain in jail.

In the Finegan episode many of the newspapers printed letters from former educational officials who quit when Finegan refused to violate the Constitution, and some wrote mild editorials telling the Governor that he may have made a mistake. But so far none of the newspapers has taken up the jail delivery that could have been prevented, that followed three months and more of smashed discipline and violence in the prison. They have been too much occupied printing the Governor's record of economy.

A Day's Visit to the Home of Henri Fabre

Concluded from page 3

Although hampered by his hard daily struggle, Fabre prepares alone the normal school entrance examination and wins the first place from the start. From that time he works with obstinacy to escape not only the miserable fate toward which his position as a primary school-teacher would drive him, but also the school of Carpentras where he has to teach.

Meanwhile Fabre had married a Carpentras girl, and with a salary of 700 francs a year he has to support the household and buy the necessary apparatus indispensable for teaching the elements of physics and chemistry to his pupils and to himself. For he clearly sees that sciences only will permit him to "make his niche" in schools of higher degree. To buy a book on natural science he spent the earnings of a whole month, but while perusing the volume, his hunger was hushed by an intuitive voice vaguely muttering: "And thou, too—thou wilt be the historian of Insects!"

Imbittered by successive disillusions, Fabre tended desperately toward one goal, freedom. To be free to work, to be free to consecrate himself to the new lode he had struck, that came to be his constant idea, his haunting ideal. A series of original schoolbooks he wrote on chemistry, astronomy, and natural science proved to be the means to this end—Sérignan, the Harmas, "a laboratory of living entomology which shall not cost the ratepayers a cent."

At the end of the narrow side-path one finds a small iron door in the stone wall. I rang the bell. The swift deluge of clear little tinklings was echoed by sharp barkings, dogs' choir dominated by puppies' raw altos. A pattering of feet, a gentle voice hushed the gang to silence. Then the door opened, with a scale of creaks.

A sweet little old lady, her face as white as her hair, her body as thin and clearly carved as a wax statuette, but in her eyes an extraordinary youthful light, greeted me.

Does my early visit annoy her? "No, indeed!" it is not early for her; she gets up with sunrise. Can I visit the Harmas? "Certainly!" The door is always open to strangers. "But pray, Mademoiselle, excuse me for being so untidy. We are without 'servante' just now. Girls are terribly particular these days. And lazy! A new one is coming tomorrow. I wonder how she will do! It is a pity to see all your things wrecked by maids, is it not? If only I could attend to everything myself! But I am too old now, much too old. And don't I look a fright with these shabby clothes—and on Sunday too! It is a shame, you'll have to excuse me."

I excused the little old lady. Her clatter was the sign of great excitement. She would rather have me wait until she fixes things in the house, I know. All right, I shall get acquainted with the garden meanwhile—should the six cats and three dogs which have been escorting us from the door permit me to approach it.

The inquiry, pointing to the menagerie: "Why so many?" evoked the reply, "My father liked them so!"

The little old lady had thus introduced herself. She was Aglaé Fabre, "Mademoiselle Aglaé" in the village.

Down the terrace, shaded by sycamores from which fall the dinning chirping of the last cigale of summer, the garden spreads its luxuriant vegetation. Garden? No, wild park, virgin forest, scrap of the mountain flora forgotten here for the benefit of some "Pan" of the valley.

Thistles and thyme, arbutus and cactus, periwinkle and serpentaria, saxifrage and lilac, encroached on the paths, mingling their foliage in a beautiful disorder. Amid their inextricable confusion stood "like a chandelier with spreading orange flowers for lights, the fierce Spanish oyster plant whose spikes are as strong as nails."

In the center stood a little pond with a mossy curb, its tranquil surface holding water lilies' heads. Swift as arrows some vivacious spiders ran over it a restless race which hardly scratched the liquid mirror.

The garden, the pond, the little pink house with green lattices nestled amid the dark fir trees —that had been Fabre's Eden, won by forty years of desperate struggle. Why an Eden? Because "this cursed ground which no one would have had as a gift to sow with a pinch of turnip seed" is "an earthly paradise for Bees and Wasps. Its mighty growth of thistles and centauries drew them all from everywhere around. All the trades have made it their rallying point. Here come hunters of every kind of game, builders in clay, weavers of cotton goods, collectors of pieces cut from a leaf or the petal of a flower, architects in pasteboard, plasterers mixing mortar, carpenters boring wood, miners digging underground galleries, workers handling goldbeater's skin, and many more."

And it is from the modest house in which my cicerone is now taking me that the Lilliputian living kingdom of the garden has sprung into history.

An hermitage, yes, indeed, with its old-fashioned kitchen where the soup pot hangs over a wood fire from a "crémaillère," the iron bar with deep saw teeth seen in every French farm. The monumental hearth place is a room by itself in which one can sit on a little bench close to the flames. On the walls, rows of bright copper pans; around the table a set of straw chairs. With an ironic smile and a charming sense of humor Mademoiselle Aglaé related to me—in connection with the kitchen—the "Pasteur's story," preciously kept in the family archives. Back in 1865 the already famous Pasteur had to solve the mystery of the disease affecting the silkworm cocoon—together with the prosperity of the Rhone Valley population. As the great chemist knew practically nothing about the patient he was going to cure, he came to Fabre who was then the only one from whom to take a valuable lesson on entomology.

Also deeply interested in biological research work which led him to the discovery of the infinitely small destroyer of our vines, Pasteur asked Fabre to show him his cellar, the place where everyone was then supposed to keep rows of barrels of differently aged wines having seen the light of day in different vineyards.

"Our cellar! Just think of it! How could we have afforded wine with a total salary of 700 francs a year! My father took Pasteur to the kitchen and then pointed to the corner where stood, on a broken chair, a ten litres stone pot of mere piquette.

"Here is my cellar, Sir."

With one dog and two cats at our heels we resumed the visit through the house. The isolated and silent upstairs room, with two big windows welcoming butterflies and bees, its showcases of rough timber, its collections of odd shells, coins, insects, mushrooms, might properly be called laboratory although it does not boast of any complex equipage. Most of the outfit is handmade. Mademoiselle Aglaé helped her father create it with the simplest and cheapest raw materials. The only costly apparatus is the microscope.

The so-called library is rather a shrine than a collection of books. Fabre's last portrait, amazingly lifelike, animates the whole place, and it is with a fervent piety that Mademoiselle Aglaé touches any object in the room, from the photographs of her dead brothers to the clock on the mantlepiece. She tells of her life, all spent in her father's shadow. She has been his pupil, his assistant, his nurse. She adored him and still so adores his memory that she wanted me to know all the minute details which can make him greater to me, the difficulties of the last years, the ingratitude and forgetfulness of the public. Her voice trembled. "After he was gone I thought my own end was fast approaching. To leave the house, to see our things sold on the public square, to think that somebody else would come, breathe the air of the Harmas, gather our lilacs, throw my father's collections into the scrap heap, I never could have stood that. But the government has been very kind. It classed the Harmas as a national museum, and I was to be its guardian. Otherwise, going away from here would have killed me. Oh, I am very thankful indeed."

She forgets, this very dear little lady, she forgets that the "government," to whom she has to be so very thankful, let her father creep in the deepest poverty although knowing the efforts, the value and the genius of Fabre. She forgets that the 500 francs annual allocation at last wrenched out of the Minister's purse allowed Fabre to afford beefsteak when he had no teeth left to eat it. "The violins came almost too late," as he used to say. And if they didn't come too late indeed, it is because some disciples, deeply moved by his abandon, called the ignorant crowd to the jubilee of the man who had been John Stuart Mill's and Charles Darwin's friend. Soon after, while glory was at last rapidly coming toward him, Jean Henri Fabre went to rest among the rock roses and arborescent heather of his beloved mountain —after having been for ninety-three years but "an humble journeyman in the toilers' hive."

His work is a delightful promenade among the Insect World, their Iliad and their Odyssey through Virginia groves. But the poetry of that song does not hide any scientific flaw. Fabre uses always the right term in the right place. His argumentation is based on solid facts and keen observation.

But what is really the link between a man and a mite? Fabre had little belief in transmutation, and had courteous arguments with Darwin about it. Above all, he was strongly attracted by the problem of instinct. Is instinct the base of a scale, with intelligence as summit? No. From generation to generation instinct is handed down in all its integrity, while intelligence is purely an accident in the individual. According to Fabre, the origin of species—unexplainable by transmutation—is to be sought for in the supreme genius, order, who rules the universe.

And Fabre leads us to philosophy, a sound philosophy, listening to the Insect Symphony instead of ascending toward the Milky Way. "An atom telling me its delights makes me forget the scenery of stars." A modest philosophy, too: "Because I have stirred a few grains of sand on the shore, am I in a position to know the depths of the ocean?" A wise philosophy, raising aloft the motto: Laboremus (Let us labor.)

BRIEFLY TOLD

In India the money lender in many cases takes two receipts, one for the exact amount loaned and the other for sometimes twice the amount. The interest charged is usually one anna on a rupee a month or about 6½ per cent a month. If the amount borrowed is paid back by the borrower both of the receipts taken are returned to him, but if he cannot pay and the money lender has to go to court to foreclose, he produces the receipt for the larger amount and collects on that basis.

The faking of sculpture has reached such proportions in France that a movement is on foot to forbid the departure of any art work from that country unless the sale is approved by the Ministry of Fine Arts and a group of connoisseurs.

One of the worst insect pests that ever got into this country is the Japanese beetle. It feeds on grass, and on the leaves of fruit trees, vines, and cornstalks and is spreading very rapidly. In certain sections the beetles have grown so dense that during fruit time the orchards have the appearance of being overwhelmed with bee swarms. They are a brilliant irridescent bronze green in color. They came in with some imported Japanese iris.

In America there are 1,500,000 unable to speak the English language. There are 3,000,000 more who cannot read it.

Factory-made grass may now be bought by the yard, and laid down in full velvety growth on golf courses or lawns. A British inventor has perfected a method of sowing grass seed on a special fabric in a "factory" where the temperature is always that of spring or summer. These green carpets are laid down on flattened surfaces, the fabric rots away and the roots become incorporated with the soil.

Under the socialistic dwelling law in Berlin, renters have their apartments virtually free except for certain taxes to the city. The income to the house owner averages not more than $1 a year. The landlord considers himself lucky if the tenants obey the law and make repairs at their own expense.

Artificial wood possessing all the qualities of genuine timber and as hard as oak has been made by a scientist of Norway. He uses a mixture of 50 per cent sawdust with chalk and chemicals and subjects the ingredients to a very heavy pressure. The product is impervious to decay and only burns at a temperature much higher than that at what real timber ignites.

Fifty-three million dollars was lost in 1922 through alteration of checks.

A 50-foot thermometer at Atlantic City can be read a mile away. Lights on the board indicate the temperature.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Five hundred times more narcotics, in the form of opium and its derivitives, are produced than are legitimately needed. The average age of the 50,000 known addicts in New York State is 23 years.

A large, seated statue of Minerva, carved from colored alabaster, has been discovered in Rome on the site of Emporium. This point was a landing place on the Tiber for marble shipments in the days of olden Rome. It was found while excavating for a new building. A workman near Ognia, Italy, found two ancient bronze vases containing 300 gold coins dating back to 300 B. C.

Alaska has an area of about 586,000 square miles, much larger than Texas, the largest state. It has a population of about 54,000, much less than three-quarters of that of Nevada, the least populated state.

Four hundred girls of the Nippon Female Commercial College are being given rifle instruction by the First Regiment of Infantry at Tokyo, Japan.

New carpets and rugs in Smyrna are given an appearance of age by the bleaching process which follows washing and scrubbing. They are hung in the sunlight on the roofs of the factories and homes of the workers.

Only one per cent of 80,000 samples of liquor seized during the last of the year was genuine, according to a report of the prohibition commissioner at Washington. He said that adulteration of bootleg liquor was leading to serious physical consequences. Drinking of moonshine may not cause death directly, but its toxins are cumulative and result in death if indulged in for a protracted period.

If the site and buildings of the old Hudson Bay post at Fort Langley, British Columbia, are donated to the Dominion Historic Sites and Monuments Board, that body will repair the old fur-trading post, turn it into a museum and preserve it as a monument to the early pioneers in British Columbia.

All corporations are not soulless. When the crippled body of little Clyde Patnoe, of Cisco, California, was swept over a 30-foot falls, the Pacific Gas and Electric Company toiled night and day with steam shovels, dynamite, picks and wheelbarrows and turned the angry waters of the Yuba River into a new channel. The body was recovered from between jagged rocks just below the falls. The child was a cripple and a great favorite with the workmen. After the rescue of the body the river was turned back into its old channel. The electric company's books show an item of more than $20,000 on the red ink side of its ledger.

Former Representative Patrick H. Kelley, of Lansing, said, "In my judgment, there is no person now living who will see the Eighteenth Amendment either modified or repealed. There is no doubt pre-Prohibition beer intoxicated many, even with an alcoholic percentage of only three and one-half per cent. Legalization of five per cent beer would, in effect, nullify the Eighteenth Amendment."

David Starr Jordan, president emeritus of Leland Stanford Junior University, said: "The bane of higher education is the desire to substitute system and drill for inspiration, to develop methods and standards in place of intellect. The university, as such, does not give opinions, but means to form them.

Within 100 miles of the Arctic Circle, Cordelia M. Karshner has succeeded in raising as many as 350 bushels of potatoes to the acre. She has homesteaded a piece of property in Alaska in a valley containing hot springs and it is due to the warmth given off by the springs that she is able to raise to maturity melons and tomatoes.

In 1920 there were more than 20,000 Indian children of school age who were not in school because of lack of facilities. All the Indians are not Osages, wealthy in oil lands. Others live on poorer reservations whose homes are hovels, tents, shacks tepees and houses with dirt floors.

Magnus Johnson, the Man

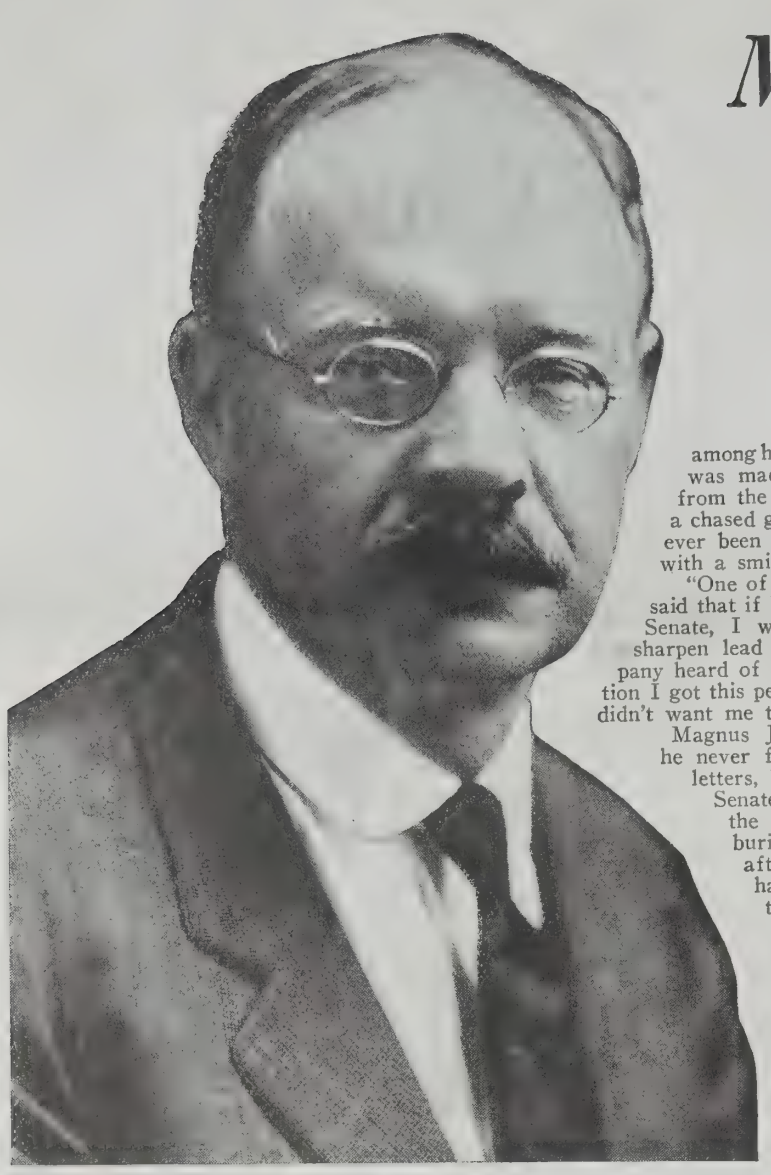
Minnesota's Farmer Senator, Unspoiled by Political Honors, Leads Simple Life

By RALPH L. HARMON



MAGNUS JOHNSON,
Native of Sweden, successor to the late Knute Nelson, native of Norway, and United States Senator from Minnesota.

THE newest member of the "greatest deliberative body in the world," Magnus Johnson, Senator-elect from Minnesota, was preparing for his first shopping trip since the election. Though his victory was a majority of 94,800 over his two opponents, including the present governor of the state, the shopping trip was a simple one. The sober gray suit of excellent material that he has worn through two campaigns was to change shifts with some sort of a new one, and he had noticed in a shop window, as he walked down the street at 5:30 that morning, one that particularly suited him.

It may astonish some of his comrades in service at Washington to learn that the new Minnesota Senator has not got out of the farmer's habit of rising at five, although he has been active in politics for the past nine or ten years and has served eight years in the state legislature.

It may also seem a little odd to some of them that he chose a ready-made suit costing $22.50 and thinks that is good enough for a United States Senator.

After alterations had been made to fit his 190 pounds of brawn and muscle, and the new brown suit had taken the place of the two-campaign gray, Senator Johnson did not call a bell hop to take the old suit out for pressing. He wrapped it in a piece of newspaper and took it himself to an old friend in the building who had mended and pressed his suits for years, and presently he returned to take up the most important correspondence in his valise full of letters and telegrams.

Dignity Unruffled by Newsboy's Greeting

AS HE arranged some of them for his private secretary, he chatted about the election and some of his recent experiences. He laughed as he related being met by a newsboy in Minneapolis a few days before election, who recognized him from his pictures in the papers and shouted: "Hello, Magnus, I've got a dime up you'll be elected." His dignity will never be ruffled at being called "Magnus" by the humblest workingman or farmer who ever visits his office in Washington. His life has been spent in contact with the soil and with hard manual labor, and he radiates a species of vigorous optimism and welcome. Evidently this is so, for he was several times accosted by strangers who asked him if he wasn't Magnus Johnson (they seemed to sense that the title of Senator was unnecessary) and they always got a sturdy handshake and a quick word of greeting. Those who think this Scandinavian farmer of Minnesota will be awe-stricken in the presence of the great at the national capital and be stumped for something to say on occasion, are due for a surprise. He neither hesitates when there is something to say, nor minces words. Asked what was the matter with the farmer's lot, he summed it up: "Wheat is down and bread stays up." To the taunt that he did not speak a pure American inflection, he humorously replied that when he proposed to his wife twenty-five years ago, he used the American language and she understood him.

One eastern campaigner, "carpet-bagging" in Minnesota for Johnson's opponent, jocularly remarked that if Johnson was elected there would soon be another vacancy in the Senate: Senator Lodge would drop dead the first time he heard Magnus make a speech. But the campaign chatter has not worried him in the least. It has only added material to his fund of always ready humor, which probably will find vent upon occasion among his associates in the future. As reference was made to some of these things, he drew from the outside breast pocket of his new coat a chased gold pencil—the first gold pencil he had ever been observed to carry, and, holding it up with a smile, said:

"One of the other fellows during the campaign said that if I was ever elected to the United States Senate, I would only be able to sit there and sharpen lead pencils. Somehow a big pencil company heard of this, and a day or two after the election I got this pencil with a nice letter saying that they didn't want me to waste my time sharpening pencils."

Magnus Johnson makes friends. Once made, he never forgets them. As he looked over his letters, he recalled that his campaign for the Senate ended just seven years to a day from the time his friend, George Loftus, was buried, and the first thing he did the day after election, when he knew the people had chosen him to go to the capital, was to name George Loftus' widow as his "assistant secretary," a title he uses for her in preference to "clerk," the official designation. Loftus was one of the striking figures of the grain farmers' movement that stirred up Northwestern farmers to the point of organizing their first grain commission company at the terminal market, and finally organizing politically into the Nonpartisan League. He died in the midst of the struggle before victory was in sight. Johnson gives much credit to Loftus for having, as he puts it, "brought him out." Together they worked night and day addressing meetings and organizing the farmers, and Loftus sought vainly to induce Johnson to run for lieutenant governor in 1914. Loftus said that Johnson was like Senator La Follette (whom they both admire greatly) a fighter, a hard hitter, and he thought Minnesota farmers would find him a great political leader. But Johnson, unschooled in more than local politics, refused to run for lieutenant governor, although he did run for the lower house of the state legislature and was elected. This was his introduction to state politics, and he was re-elected and was the unsuccessful candidate of the farmer contingent for speaker. After two terms he was elected to the state senate, where he served through two sessions, and refused to take the nomination for the governorship in 1920 when the Farmer-Labor party was looking for a candidate. In the 1922 election he ran for governor and was defeated by Governor Jake Preuss, whom he in turn has now defeated by a popular landslide.

Although his political career began in Minnesota in 1914, his political thinking began about thirty-five years before that in his native town of Lidjedahl, in the province of Warmland, Sweden. Magnus recalls with warm enthusiasm that a youthful chum of those days, Hjalmar Soderbom, afterward became a member of the Swedish parliament, and he gives credit to the clubs and co-operative associations of Lidjedahl for the trend of thinking that has distinctly marked his whole life. He was an only child, the sole support of his widowed mother at twelve and an orphan at seventeen years of age. He learned the trade of bottle blower (which accounts for his great lung power) spending eight years in apprenticeship and practice, and at the age of twenty came to the United States, and headed straight for the lumber woods of Wisconsin where his powerful frame and rugged physique assured him employment. He was there the year that James B. Weaver got more than 1,000,000 votes for President as candidate of the People's party, and Magnus' Lidjedahl education in practical life made him an apt student of the popular movement in the United States. Though he could not vote, he joined the Knights of Labor, then the dominant labor organization, and was keenly interested in promoting the welfare of himself and his fellow men through organization.

From "Lumberjack" to Farmer

MAGNUS was a Wisconsin "lumberjack" for two years. He swung an ax in the woods, pitched slabs and saved his money. But there was the lure of cheap land beyond, and with $400 in his pocket he set out for Western Minnesota in 1893 and stopped in Meeker County where he bought his first forty acres of land and became a farmer. In that section at that time there was not much land open to cultivation. Magnus had to clear the heavy timber off before he could raise crops, and for the next sixteen years he was busy slashing down the forest and adding to his tillable land acre by acre. Magnus cut cordwood and hauled it fourteen miles by team to Litchfield, the county seat, where he sold it at $1.85 a cord. Alongside the income of those early days, the salary of a United States Senator looks munificent, but he thinks his new job is the hardest. It used to take one day to cut a cord of wood, and then an all-day trip, starting about 4 a. m., to haul it to town. He got home long after dark, but his good wife could milk the cow, and so after feeding and unharnessing his team, and eating a plain supper, he would tumble into bed in the little log house and sleep a few hours.

It is no wonder that Magnus rebelled. The cordwood buyers made several times as much clear profit on the farmers' wood as the total amount received by the farmers, and Magnus delivered his maiden speech on the streets of his county seat town, to a group of roughly clad cordwood haulers, urging them to stick for more money. This movement had its effect, and the price paid to the farmers for their wood was increased. Perhaps his public career ought to be considered as beginning with this experience. He was recognized as a leader in Kingston township, was justice of the peace, secretary of the school board, president of the first creamery association, director of the first farmers' elevator there, and held many other positions given him because of the confidence of his neighbors.

From the decisions of Justice Magnus Johnson no appeals were ever taken, not because of any terror that the justice instilled into litigants, but because, if there was any dispute that seemed likely to go beyond the court, the court itself would hitch up its best horse to the old buggy and jog out to the premises of the contending farmers. Only once in his long career as justice, was there ever any real danger of a case getting into the district court, and Johnson's hundred per cent record of no appeals was saved by his own reputation for being fair. Each party to the suit set out to Litchfield to hire a lawyer and overrule the court of Kingston township. But lawyers were almost as scarce as hen's teeth in those days and each litigant in turn visited the same lawyer and laid the case before him. The lawyer listened to both sides and got all the details, and when he learned that Justice Magnus Johnson had rendered a decision, he advised his would-be clients of both sides to accept the court's decision, and they did.

Johnsons Reputed Good Farmers

AT HOME the Johnsons have always been—just farmers. But they were good farmers. Besides the forty acres he bought with his first savings, Magnus has added another one hundred acres of fine land. He has made it all rich and productive by his labor and by following the best farm practices of rotating crops and keeping plenty of live stock.

Young Magnus Johnson, Jr., born on the Fourth of July, fourteen years ago, wants to follow in the footsteps of his father—not into the political arena, but into the fields and feed lot where his father made good. The farm has been rented on a fifty-fifty basis to the two oldest sons, Victor, aged twenty-one and Francis, aged nineteen, who intend to keep up the Johnson reputation of being good farmers. The rest of the family will go to Washington, Mrs. Johnson, Magnus, Jr., and Agnes and Florence, aged ten and nine respectively. The eldest daughter, Lillie, will also go with her parents.

And that leads to the question: How is the Johnson family going to live and have its being at the national capital? That question has not been fully decided, but the most likely prospect is that they will find some cozy little farmlet out Maryland or Virginia way and keep a cow and a few chickens, and let Washington be to them what the county seat at home has been, a place to go to when there is business to be done.

There has been some ado about a land project ostensibly launched for the benefit of disabled veterans of the Great War, and it has been alleged that the prices charged the veterans were too high. Senator Johnson willingly spent half a day going over the project, stopping to talk with the residents, making little one-minute speeches a dozen times or more, and absorbing as much first-hand information as his practical farming experience and his keen observation would permit. On his way back to Minneapolis from this trip, he passed near where 400 employes of a big co-operative creamery, with their families, were holding a picnic. Someone recognized him.

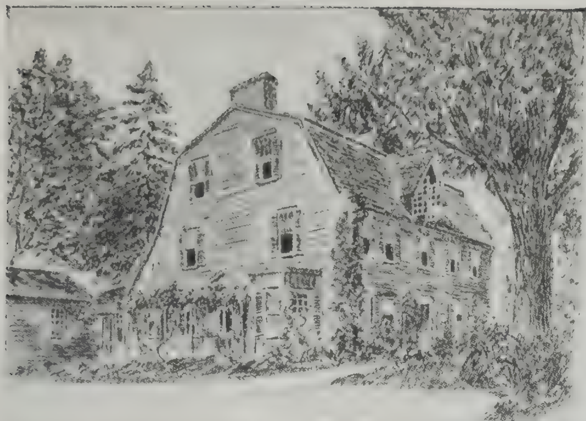
"Magnus Johnson!" went up the shout. It was repeated, as the autos carrying the Senator and his party sped by. There was a scurrying as a spontaneous committee of creamery drivers scrambled into an auto and started in pursuit. They were halted by a motor traffic officer, but when they told him they were after Magnus Johnson to make a speech to them, the officer gave them permission to break the limit, and off they went with a whirr of wheels at sixty miles an hour—and they got him, too. He couldn't refuse and so was taken back to the woods where he talked to them about co-operation, and reminded them that while legislation can correct some abuses, the producers themselves must join together and stand together for their own economic welfare.

Magnus Johnson looks practical. He has never put on any "airs." He talks like the rest of them, and they know he lives like they do. He was the first state president of the first big farmers' organization in Minnesota during this generation; was put to the front in his own township and county in all sorts of local organizations, and at one time held twelve such offices. But none of these things made him any different than he was before. Sitting "at the King's table" doesn't spoil him.

The Old Manse Bespeaks Spirit of Concord

It and the River Drowsing Along in Tangle of Lilies Feature Beauties of Historical Spot

By MAY B. WHITING



The Old Manse

CONCORD is to America what Greece is to the entire world. It is the classic episode in our literature, its story an idyl where plain living and high thinking shine as brightly as in the Golden Age of the Ancients. And, with all honor to progress, whoever would gain for his work the quality of permanence must go back through the labyrinth of modern theories and drink at the same Parnassian fount.

Perhaps the Concord River is that stream. At any rate, none other flows so near the heart of the American people or has reflected so much beauty for eyes that could discern it. Drowsing along in its tangle of lilies and jewel and pickerel weed, it holds in its bosom dreams of the brave deeds it has mirrored and of the noble brotherhood who lived beside its banks.

One of the rooms of the Concord Antiquarian Society.

I think the spot beside which it lingers most lovingly is the Old Manse. Set away back from the street, at the end of its avenue of black ash, it seems a house of dreams, dusky in the mist of Hawthorne's romancing. It was built before the Revolution by Rev. William Emerson, grandfather of the poet. When, on April 17, 1775, the fighting drew too near his home, he left his place with the Minute Men and went to protect his family. From his house he saw every move of the bright, glittering lines of British and of the scattered groups in homespun. Quite likely the morning breeze wafted the smoke from that immortal shot about his study window. Ralph Waldo Emerson spent a great deal of his youth in the house and later lived there. In the narrow study at the rear he wrote many of his poems, and *Nature*, the first noteworthy book in American literature.

But it is the residence of Hawthorne in the Old Manse that gives it the most of its glory. With the marriage of William Emerson's widow, the house passed into the Ripley family. The first of the new occupants, Ezra Ripley, lived there more than sixty years and in it wrote his thousand sermons. At his death, the heirs, owing Hawthorne money after the Brook Farm failure, offered the rent in lieu of payment. And so the Hawthornes were happily married, and, after their wedding journey from Boston, twenty miles and three hours, came to reside in the old house, then, as now, "shadowy with solemn thought," and ripe for the gleaning of the *Mosses*.

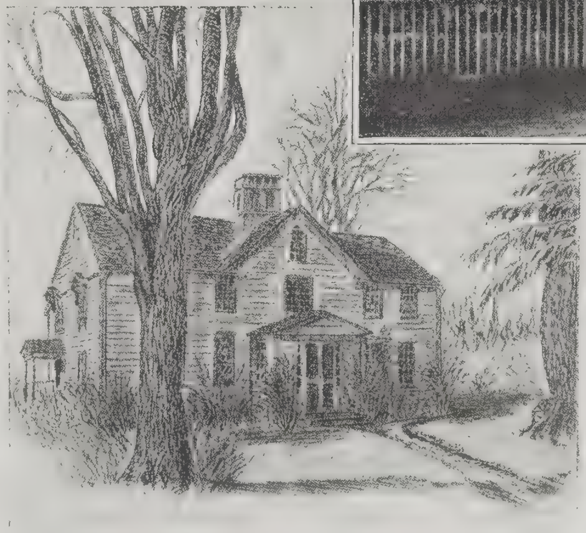
The place was well suited to a genius like Hawthorne. Probably not half a dozen residents of the village ever saw his face. In the morning a sober figure hoeing in the garden, at twilight a shadowy silhouette upon the hill, at dawn an apparition by the river, so, except for the perfect companionship of his wife, he led a lonely and charmed existence. Even when left alone for a few weeks, no neighborly help was required. An old Brook Farmer, very learned but subject to mental derangement, visited him and the two kept house together. For to the romancer's fancy, the village was thronged with strange, hobgoblin shapes, restless spirits come to learn from the great teacher the word which should explain the universe.

For the Emersons had removed to a fine sunny house at the other end of the town, a place as typical of morning as the Old Manse is of afternoon. At the right, just sweeping the study window, is a grove of pine and fir, adding a touch of poetry to what might seem New England primness. There is very little change since the master left. The handsome study remains the same and, pervading all, is the cheerful dignity that becomes a house which has sheltered more famous guests than any other in the country.

Best loved of all the Concord shrines is the Alcott house. as the Alcott family is the best loved in American literature. A stormy life they had of it, with poverty, failure, humiliation, forever at their heels, but love and service transmuted all into such rare beauty that no child can read their annals in *Little Women* without longing to share such trials and such victories.

Mr. Alcott finally settled in Concord after the failure of Fruitlands in Cambridge, "a new Eden where man, untempted by evil, might dwell in harmony with himself, his fellows, and all external natures." But the high-souled enthusiasm of its founder could not render sufficient the fruit and vegetable larder and the members gradually drifted away, until, one bitter cold morning, he loaded his family on an ox sled and abandoned Utopia forever.

Emerson was always the good angel of the Alcott family, and, with his help and a small inheritance of Mrs. Alcott's, Orchard House was bought. It was really two old houses, but Mr. Alcott had a genius for architecture and delighted in remodeling. What if the two do meet in the middle of the dining room floor? There are delightful juttings in and juttings out, and old ovens and ash holes make charming alcoves for statuary. On the doors are the original H and L hinges. Holy Lord, the letters stood for, and were potent to keep away evil spirits when witches were abroad, but Mrs. Alcott's kindly thought gave them a new meaning, Home and Love.



Orchard House, home of the Alcotts.

The house is now the property of the Louisa Alcott Association and is fitted up with the old family furnishings. Over the fireplace are the verses written for them by Ellery Channing,

> "The hills are reared, the valleys scooped in vain,
> If learning's altars vanish from the plain."

On window casings and panels are drawings by the artist daughter, May, as well as numerous figures and sketches in her workroom. In the closets hang the clothes which the girls made for their theatricals and in the hall stands the little deerskin trunk which followed Mr. Alcott about the country when he gave his lectures and "Conversations."

Just back of Orchard House, in the grove, is the School of Philosophy, established by Bronson Alcott in his eightieth year. Emerson aided in the project, as did Franklin Benjamin Sanborn, author, editor, and prison reformer. Louisa Alcott writes in her journal, "The town swarms with budding philosophers and they roost on our steps like hens waiting for corn." This little chapel on the pine-clad hill fitly rounds out the life of a great and loving teacher.

The Alcott family was extremely generous, even in their poverty, of their time and of their few possessions. Lacking money, they would give away their entire dinner. May Alcott gave the clay and the first instruction in modeling to Daniel Chester French and Frank Elwell. The statue of a Minute Man by the former is one of the best pieces of work in America, and the latter was the first American to have a statue erected abroad. The books by the Alcott family fill two shelves of the alcove in the public library devoted to Concord authors. No other family has made such a contribution to our literature nor one which reflects more justly the life and manners of the time.

The Emerson House.

Next to Orchard House is Wayside, where Hawthorne lived during his last twelve years in Concord, and from the circular tower of which he sent forth most of his later works. Just beyond is Grapevine Cottage, home of Ephraim Wales Bull, the producer of the Concord grape. The original vine still grows on its trellis, old and gnarled in appearance, as becomes the parent of so great a progeny, a brood which has enriched hundreds of nursery men but brought the scantest pittance of gold and fame to its originator.

Of all the Concord group, Thoreau was the most original genius. He spent almost his entire life in the village and was fond of saying that there was nothing in the world outside which could not better be observed at home. "He talks of Nature," Madam Hoar remarked, "as if she were born and brought up in Concord." Emerson sometimes reproved his lack of ambition. Instead of engineering for all America he was captain of a huckleberry patch; capable of pounding empires, he was content to pound beans. But engineering works will crumple and pounded empires rise again before *A Week on the Concord and Merrimac Rivers* and *Walden* cease to charm. On the shore of that "crystal pond" where Thoreau built his hut, visitors have made a cairn of stones, a homely tribute to the great soul that passed two eager years there, revelling in such delights as the blue of his shadow on the snow and the pungent flavor of "saunterer's apples."

There were other naturalists at Concord, perhaps attracted by the presence of Thoreau. One Minott Pratt, a Brook Farmer, increased the flora by a hundred species. Whenever he could spare a day from his farm he went out into the country, brought back a flower that did not grow in Concord and planted it in some secluded vale or meadow.

In fact, Concord claims many notable citizens. There was Ellery Channing, the "poets' poet," in "his lonely cottage on the hill." There was the Hoar family and Harrison Gray Dyar who, along the Lowell road, erected

(Concluded on page 12)

CHANGE OF ADDRESS

To receive your copy without interruption, please observe the following:

1. Notify us at least two weeks in advance.
2. Give both old and new address.
3. Write clearly.

Migrations

A CURIOUS kind of reasoning results from the treaty of Lausanne. The sentimental portion of the western world is chagrined that the Turk should have won the concession of his right to come back to Europe. And that same element sorrows that the treaty should require Turks in Greece to quit their acquired homes and go back to Turkey, while Greeks in Turkey are ordered to give them their new homes and go back to Greece.

In America, certain persons have likened the sufferings of evicted Greeks and evicted Turks to those of the Acadians, cherished in the immortal verse of Longfellow's "Evangeline."

These sentimental individuals were doubtless the first to applaud the decree of a few years ago that the Turk must leave Europe. They saw nothing sad in the banishment of the Turkish people from a land they had called their home for four centuries, yet they are deeply moved over the eviction of a comparatively few traders who have exploited the dwellers of a distant land for a few years.

The Turks who must leave Greece and the Greeks who must leave Turkey are, for the most part, shrewd traders who have wandered far afield in an effort to barter goods. Their original and continued pursuit of trading was in the way of being a gamble. They were wagering their smartness against the lack of sophistication of the type of people who live their lives out in their homeland. It was an unequal battle of wits, and the traders had all the advantage.

Neither Turks nor Greeks affected by the eviction terms of the treaty are the highest types of their races. They are rather the parasitic exceptions who seek to gain their livelihood out of the earnings of others. Hardships in individual cases will doubtless result from the treaty terms. But more lasting harm might result from a different decision.

The Subsidized Press

THE presidential campaign of 1924 is not a matter of nearly a year from now, as many imagine. It has already begun.

True, it is early to speculate as to the individual candidates of the major parties, but the issues and the policies have already been decided upon by the bi-partisan "invisible government," and no man not favored by that power stands much show of nomination.

Only a revolution like that in the silver campaign of 1896, when the Democrats repudiated the Wall Street regime, will carry the leadership outside the reactionaries struggling for the place.

Should the plans of the true rulers carry as expected, the progressive movement can hope for success only in a policy which will unite all elements in a common cause—a third party.

There is little hope in the metropolitan press, largely controlled or subsidized by privileged wealth. This fact is recognized by all, and we are frequently told the hope of the nation is in the honest rural press, where the people may depend on a fair presentation of the issues and an expression of the popular wishes and ideas.

Yet this hope may mean the leaning on a broken reed.

For the rural press is today carrying the insidious propaganda of the "invisible government" and imbibing the economic theories expert writers are paid to present, some without knowledge of the influence they are exerting.

In plain terms, the rural press is being subsidized wherever possible, and many weekly local journals are circulating propaganda calculated to counteract the work of those who are openly fighting for political and economic freedom.

The method is not new, but is generally not understood, except by those who accept the plan as a means of economy in time and money.

City publishing houses supplying "patent insides" for papers printed in part at home, and "plate matter" for those who do all their own presswork, are employed to make plates from copy prepared by the publicity organization financed by the interested power, and to offer free to all publishers who swallow the bait the use of the matter thus made ready for general consumption. Acceptance of the proposition is more general than might be expected, for several reasons:

1. The editor who, from honest conviction, supports the theories advocated in the prepared matter, saves the time and effort to discuss the questions involved, and the expense, not inconsiderable, of buying miscellaneous plates or the composition of selected matter at home. The saving in expense to the smallest paper thus utilizing the offer must reach a sum not less than $500 a year.

2. Papers without political preference frequently use the same matter for economy's sake, thus unconsciously accepting the bribe involved.

3. Interested local influence is brought to bear, and the struggling country publisher is peculiarly susceptible to certain local influences.

The issue as thus drawn is the Money Question.

No matter what other issues are advanced, national or international, protection or free trade, public or private ownership of utilities, or any of the many minor problems confronting the people, the "invisible government" has decreed that monetary reform shall not succeed, and is busy already in its work of propaganda.

At least six ordinary newspaper columns a week are available to any country publisher without cost to him, in plate form, ready to print, if he abjures the readyprint, or "patent" plan, or inserted in the printed pages if he buys his paper partly printed.

The reader of his home paper, who, in ordinary times, finds its contents confined to local gossip, short and serial stories, and perhaps some syndicated departments, like farm and garden, household, and other innocuous literature, has, within the past few weeks, been regaled with articles by unknown writers on the money question. Occasionally one, intended to be impressive, bears the writer's name, but we have yet to recognize a reliable authority. Some articles are prepared in usual editorial style, as if the work of the paper itself. Needless to say it is of a partisan character, and so lacking in detail that nine of ten editors using the page will be unable to reason with a tolerably well-informed subscriber in defense of what he is supposed to have written.

The mention of the titles of the articles released for the week of the "Glorious Fourth" may show some readers whose own home papers have used the stuff how subtle this method of propaganda is. In editorials, and the paper in which they were found has rarely given expression to views other than of a local nature, are: "The Mortality of Savings Accounts," "The Federal Reserve Copied," and "For Sound Money." None of these is especially vicious, but the trend is toward future effective work.

Like them is a feature on "The Secret of Why Some Men Can Obtain Credit, While Others Can't." It is inspiring of faith in future articles.

Pernicious in effect is "International Banker a Myth," by Otto Kahn; "Keep American Wampum Sound," by Samuel H. Beach, president of the Savings Bank Division of the American Bankers' Association, and "The Edison-Ford Plan Unfair to the Farmer," the third of a series of articles on the subject, in which the tiller of the soil is warned of the danger of being unable to secure credit if the plan ever is adopted.

The tenor of all this propaganda indicates that the American Bankers' Association is being used to pull chestnuts from the fire for the delectation of the "invisible government," the "international banker," and the money oligarchy; yet the real interests of a majority of the members of that association are with those whose plans for monetary reform would lead them, as well as the people at large, out of financial bondage.

Taking Off the White Collar

A SPLENDID idea, no less splendid because of its simplicity, was evolved in New York City out of the difficulty over obtaining bricklayers to build necessary public schools.

The rise in wages due to the scarcity of labor in the building trades put the building program in a precarious state. The number of bricklayers in the country has decreased during the past score of years, while building projects have been vastly extended. Recently New York found that its limited building appropriations permitted the expenditure of not more than $11 or $12 for bricklayers, while skilled masons were receiving $16 and $17 a day on private work.

Conferences between contractors, city officials and laboring men resulted in the threat of the former that they would establish schools in bricklaying as a means of beating down wages. Had the plan been carried out, war between employers and bricklayers would have been an inevitable result. But the bricklayers themselves came to the front with a suggestion.

They urged that bricklaying be taught in the public schools, that courses be made available to all who desired, and that the study of bricklaying be placed on the same plane as carpentry and other trades previously taught. The suggestion will be adopted. Theoretical instruction will be given in the schools, and opportunities for apprentice instruction in practical bricklaying afforded elsewhere.

The tendency of school authorities to authorize instruction in practical mechanical work has grown during the past few years. Only a cheap and un-American snobbishness is responsible for the failure of all schools to teach such eminently practical methods of obtaining livelihood as bricklaying. This snobbishness, fortunately, is disappearing rapidly. The day of the white collar as the mark of gentility is almost gone. It should never have dawned in a free land.

A great mission of the American school should be to teach democracy. Another great mission should be to teach the pupil how to make a living. It is possible to teach both of these fundamentals without denying to the pupil a fine education in literature, science and arts. Bricklaying, carpentry, and other honorable methods of livelihood may be offered to a boy in school. They should be offered in a way which will stir his ambition to master them. They should be offered by instructors who will arouse in the boy the realization that they are worthy, profitable and pleasant employments.

The school's duty to teach the three "R's" and kindred subjects is not to be questioned. But the school owes a duty to youth, to prepare it for practical problems of life. And it owes to the future generation the duty of filling the wants of that generation. It would be a national calamity if a coming era should awaken to discover that a dearth of bricklayers, of carpenters, of mechanics of any sort, compelled a halt in national progress, until the trades were learned again. Schools can avert a skilled labor famine, by teaching labor as a fundamental. In so doing, they will afford their students what they most need, an opportunity to learn various methods of obtaining livelihood, so that each may select the work for which he is best fitted.

No More, Please

LOCKING the stable after the sheep are gone is not much of a precaution. But when railroad executives rail over the impossibility of paying a return on investment with rates and wages at present standards, it is difficult to refrain from mentioning a too frequent source of railroad deficits.

Many of our great systems were built over routes which necessitated that they go over bridges and through tunnels. And all enter cities.

At the time railroad capitalization and buildings, stock and bonds were sold on the railroad itself. Also at that time, bridge companies, tunnel companies, terminal railroad companies came into being. The stock of the latter was seldom discovered on the market. Frequently the owners were identical with the inside promoters of the railroad, sometimes the directors themselves.

Bridge companies, tunnel companies and terminal companies made comfortable arrangements with the railroads, whereby their profit was always guaranteed. The railroad itself might fail to pay dividends, but not the bridge company, the tunnel company, the terminal company.

With railroads built and their contracts made, there is little to be done about the situation. But the Government owes it to the country to see that no more unconscionable arrangements of the sort are made.

Mr. Ford's Page

THE governments of the world seem to be approaching the point where they shall be ready to agree that the impossible is impossible. It has been a hard lesson to learn because the element most to be considered in the "impossible" these days is not force but timeliness. What is impossible today may be almost spontaneously self-existent tomorrow, without our leave or let. During the old era, which began to go out with the war, and which is rapidly running down to its last end now, it was indeed possible to bring things to pass by main force. We had only to decree what we wished, then line up the engines of our power in whatever field we were operating, and exercise what came to be known as "steam roller" methods, and the thing was done.

Well, the surprise of the world today is that steam roller methods don't work any longer. No one has been wise enough to tell us just why, but a plain mind is doubtless right in suspecting that the mystic spirit of history has something to do with it, some destiny has thrust itself into the midst of the problem and has turned a trick or turned a corner—at any rate, the wise men discover that their old methods don't bring the old results. Life seems to be on a different schedule. The captains and kings and counselors show a rather confused and uncertain front to the people of the world when they try to act as if nothing were out of the ordinary course. The exceptions to that condition are rather notable: expressed in national names they include Great Britain, Italy, Germany and Russia. The statesmen of those nations, and the people also, seem to have obtained an inkling of what is occurring in the world.

> *THE world is being shaken down to a basic condition. Delusions are evaporating, mental reluctance to face the facts is gradually passing away. Two events have lately conspired to induce a sober view of the overhead influences which are operating to shift life to another angle—one was the passing of the head of the American Government, whose death has certainly altered the point of view of the American people; and the other is the sudden spirit of fact-facing which has fallen upon the diplomacy of Europe. It has at last reached the mind of the rulers that the old steam roller methods of force and power cannot be made to work. It is not that humanity is more feeble, but something has interfered, a new wave-length has been decreed, a higher hand has taken the helm, and humanity is safest in retiring to its elementary obligations to love and labor.*

Driven to a certain sort of desperation, caused by the utter insolvability of their problem, men who are otherwise to be trusted and to be regarded as able to find a way out of awkward situations, have frankly thrown up their hands. It was not the problem before them that greatly concerned them, it was the problem of what remained behind them. There were so many lies told to the people in the good old days—we shall be safe enough in using the strong old word lies—that it is rather difficult at this late stage of life to justify all that has been said. Public officials are averse to making confession. It may not be their own mistake that they have to confess, and they have a hesitation in explaining to the public that their predecessors may have been at fault—that is one of the feelings that exist between good and bad officeholders, a kind of unpatriotic unionism between them, as if their first consideration were to each other, or their class, instead of to those of us who are the ordinary decent productive people of the United States. Publicity has been so easy and so utterly unquestioned (thanks to the disappearance of the editorial mind from our Press) that it is almost revolutionary to contemplate what must be done to put the popular mind back on a basis of plain fact. Officials need not be too harshly condemned for their reluctance in this matter, nor for their honest sense of reticence. The situation is bad, and might easily be made worse by too much talk. As if the instinct of the people recognized this, we are seeing a higher type of man occupying public office today, but we also see how the first views of their duties affect them. Honest men are crushed by the accumulated load of lies on which the people have been living these last thirty or thirty-five years.

The only hope that the candid mind may rely upon is to be found in industry. Industry which a few years ago was equally condemned by the romancers of literature and art and the demagogues of politics has proved itself to be the sheet anchor of our national stability. Politically we are much worse off than any statement on this page would indicate: you have only to talk with the leaders of both the old parties to discover that (and they know); but what does it matter? Who really cares? The people feel that as long as all of us go to work every morning and really do things during the day, it doesn't greatly matter how a group of orators at Washington conduct themselves. Not that anyone intends to be disrespectful toward those orators; it has simply become the case that they don't matter. It is pleasant to record that some of the best of them are themselves coming to feel that way about it.

The importance of industry, as distinguished from politics, is indicated by the events of the Ruhr occupation and its effects. Right or wrong, the politicians of Europe, on both sides of the matter, have shown their utter bankruptcy so far as common sense is concerned. They have sought to bring the political and military regions of authority directly upon the most highly industrialized center of the Continent, and the failure of it is obvious to all observers. The explanation is not to be made in terms of politics or militarism, but in terms of industry—industry is superior to them all. It is the ruler in all the regions of authority because it is honest and because it lives upon the most wholesome motives of men and because in the end it serves all its servants.

Two events have concurred of late to shake the mind of the world down to a basic condition. One is the death of President Harding. That was something more than personal, its wider indications touch the mental attitude of the nation. His physical decline is doubtless to be attributed to the problems he met, and the depression which seized upon him was doubtless due to his clear understanding that political methods were forever out of date and wholly ineffective in such problems as he faced. There were signs during the last year that he, or someone for him, was making an effort to make the political engine turn over once again and give at least one more impulse toward the solution of the world's problem. Mr. Harding had little faith in the possibility, but he did lend his energies to the attempt, and it is only the truth to say that the results were nothing. Then, shockingly sudden, came his own passing, and it is extremely unlikely that the attempt which he and his friends made to compel a political solution of politically insoluble things will be repeated.

The other event of note is the plain speaking which Great Britain has been sending to France. That is not politics. That is one result of the pressure of cosmic fact upon the receptive mind. There is no diplomacy in it; certainly there is no diplomatic victory in it. The wisdom of diplomacy at this stage of affairs is to see that diplomacy doesn't count, and this wisdom of insight seems suddenly to have fallen upon Britain's statesmen. They are ready for a diplomatic defeat if thereby the facts of a situation may be embossed upon the consciousness of the world.

What has been coming upon the world in great waves is a sense that for the time being certain great determining trends of influence are out of our hands, and that the wisest thing we can do is to take up the simpler daily duties and watch while God or Destiny takes charge of the greater things. If the wisdom of our wise men does not evaporate we shall probably see such a return to the simpler duties.

It is not to be charged against our statesmen that they cannot settle world affairs, because the fact is that the time has not come for what we used to call settlement, and the fact also is that world affairs are settling themselves, as the sea settles itself after a tempest. The fault to be charged against statesmen is that they are still under the influence of the delusion that they, with their puny hands, can compose the sea of difficulties.

But, when you cannot clear up the world, there is always your back yard. National overalls would become us more at this period than international brass buttons.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Seeing China Through Its Art

"Heavenly Horses" of 1,300 Years Ago, Stone Bas-relief, Brought to Philadelphia Museum

By WILLIAM A. M'GARRY

This is one of two articles, the second will appear in an early issue.

A huge figure of Bovhisattva, or Buddhist saint, in wood, Tang dynasty, one of three known examples of this technique in University of Pennsylvania museum exhibition, Philadelphia.

CHINA is shrouding herself once more in the veil of mystery that she has worn for ages uncounted now that the Japanese have left Shantung, the Chinese Holy Land. With that great area back in the hands of its original owners it is just as though a door had been closed, so far as the western world is concerned.

It is possible for the Occidental, however, to get a glimpse at the heart of China, to see it as it is seen by the explorer who is also a student of racial origins and of history, and to see it for oneself through the medium of its art. During the period after the Boxer Rebellion opportunity arose for the smuggling out of the country of some of its finest works in stone and bronze, together with the later exquisite paintings on silk. In recent years, despite the almost constant civil war, China has put a stop to that, with the result that examples of her ancient art are becoming scarcer every day. The markets of the world are still flooded with more or less crude modern imitations, but the genuine vases and statues are so rare that they have become prohibitive in price.

The University Museum of Philadelphia has been singularly fortunate in getting a collection of such articles, so much so that an entire wing of the institution's main building has been devoted to a permanent exhibition of Chinese art. During the years when masterpieces were being offered for sale three archeological expeditions were sent into the country by the museum, all led by Dr. Carl W. Bishop. The latter was born in China and speaks the language like a native.

His description of Shantung, written with an understanding of Chinese feeling, lifts for a moment the curtain of mystery. It shows that back of the mask with which the Chinese covers his emotions there is a depth of sentiment as poetic and charming as anything that has ever come out of the West. It is interesting also that the most valuable contribution he was able to make to the exhibition carries a story that needs no explanation of its motives. Back in 1917 he started negotiations which led finally to the arrival in Philadelphia of two large stone bas-relief statues of horses—the "Heavenly Horses" of T'ang T'ai-tsung, who rode the living models of them to victories innumerable 1,300 years ago.

Those two slabs of stone are said to have cost $100.000, but experts in Chinese art consider them beyond price. Throughout all the teeming countries of the East, representing at least a quarter of the earth's population, the "Heavenly Horses" have been immortalized in song and story just as the sculptor for T'ang T'ai-tsung has made them live forever in stone. The emperor's name before he ascended the throne was Li Shih-min. He was the son of Li Yuan, a famous general. While he was still in his teens Li Shih-min discovered a plot to have his father killed, and after inducing him to revolt, Li Shih-min took the field. According to Dr. Bishop he spent the next eight years in the saddle, disposing one after another of numerous competitors for the throne and beating back the Tartars. During all that time he had six chargers. When he died in 649, the stone likenesses of his horses decorated the interior of his tomb, which still stands not far from Li-ts'uan Hsien, to the northwest of the provincial capital, Si-an Fu.

Some years before Dr. Bishop's visit one of the military governors carried away the best two of the six slabs to prevent their destruction, and later sold them. They were traced halfway around the world by Dr. Bishop and by Dr. George Byron Gordon, director of the museum, until finally they were taken to Philadelphia. The four others are now in the provincial museum at Si-an Fu.

It was under Li Shin-min that China reached what might be called the second peak in its artistic and cultural history. Dr. Bishop quotes a noted historian as saying, "At this time China undoubtedly stood in the very forefront of civilization. She was then the most powerful, the most enlightened, the most progressive, and the best governed empire, not only in Asia, but on the face of the globe." His study of Shantung, however, goes back a thousand years beyond that date. Since the exhibition at the museum covers all periods of Chinese art back to 2000 B. C., his account of the religious significance of Shantung is of value in getting an appreciation of the various examples in the exhibition. In Shantung, he points out, is the world's largest cemetery. It has been in use for 2,000 years, and it is estimated to contain 1,000,000 bodies, yet it is still devoted to the members of a single family, the family founded by Confucius.

Kwan-Yin, the Chinese Goddess of Mercy, also known as "The Goddess of a Thousand Hands," in the University of Pennsylvania museum.

"Not chance alone has brought Shantung instead of some other of China's 18 provinces to the fore," says Dr. Bishop. "Since prehistoric times the region has been a pivotal one, exerting decisive influence on the cultural development and the political destiny of all Northern China. There, thanks no doubt to its fertility and its temperate and stimulating climate, the ancient Chinese civilization attained its highest development about the time of the wars between Persia and Greece. There, again, arose in the fourteenth century of our era, the patriotic upheaval which ended in the expulsion of the powerful Mongol dynasty of Hubilai Khan, Marco Polo's illustrious patron. There, also, began the Boxer movement of 20 years ago.

"It has not been, however, its cultural and political significance that has rendered the province in a very special sense the Holy Land of so great a part of the human family. It is the presence within its borders of two sites dearer by far to the Chinese people than any others within the confines of the republic; the sacred peak of T'ai Shan and the birthplace and tomb of Confucius. Slopes of the mountains are ascended not by ramps, but by flights of stone steps, neatly hewn and put in place. The carriers tell us that these number 7,000. We know that pilgrimages to this mountain have been going on from prehistoric times."

In early days the worshipers believed that the mountain of T'ai Shan was alive, and even now it is considered the abiding place of a spirit. The god of T'ai Shan, to whom temples have been erected in every town of consequence in China, is the Judge of Hades, casting up the debits and credits of departed souls. There is also a goddess of T'ai Shan, the Princess of Colored Clouds. Dr. Bishop says she corresponds to the rosy-fingered dawn of the Greeks, and is the counterpart in the south of the famous Buddhist female goddess of the North—Kwan-Yin, the Goddess of Mercy, also known as the Goddess of a Thousand Hands. The museum has a remarkable example in gilded bronze of Kwan-Yin.

The Buddhist influence was most marked in the art of China during this era, but Confucianism has likewise made itself felt more in the lives and conduct of the people.

"It is less through age than in continuity of conscious racial, cultural and political existence that China exceeds the rest of the modern nations of the earth," says Dr. Bishop. "For example, the very name of the little sacred city near the tomb of Confucius dates back to a time when Thebes and Babylon were the leaders of the western world, and Athens and the imperial city of the Tiber were yet unknown.

"Through its narrow and crowded streets one comes to the great Kung Miao, the Confucian temple par excellence, original and pattern of all the countless others which have been planted wherever men of Chinese race have gathered together. Occupying nearly a quarter of the area of the little town, we find it a great congeries of courts, containing stately yellow-roofed buildings, noble trees and inscribed stelae, of which, without the aid of a plan, it is hard to form any ordered conception. The approach to the main building is by a succession of stone terraces, with carved balustrades.

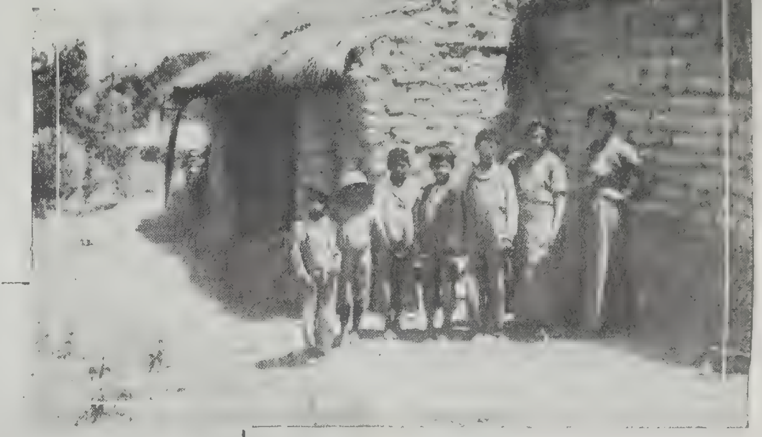
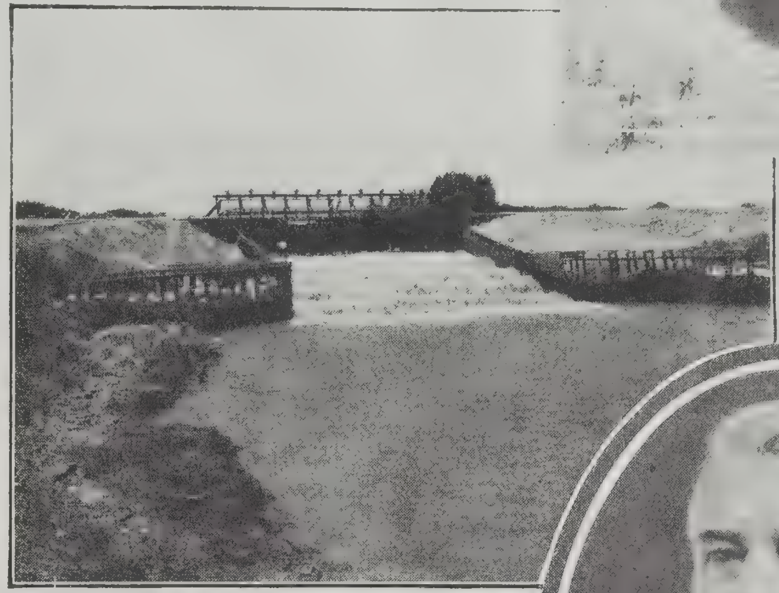
One Hundred Thousand Acres of Cotton! Great Plantation Stabilizes Crop

More Than 12,000 Mexicans Put to Work in Lower California, and Revolution Is Now a Thing of the Past



These are the people whom cotton, put into Mexico by Americans, is helping most, and it is interesting to note that the cotton-growing area is one of the few parts of Mexico which has been almost untouched by revolution, because the promoters of revolution could get no foothold among people who had plenty of well-paid work open to them. The photo shows a Mexican family at their *adobe* and brush *jacal* in Lower California.

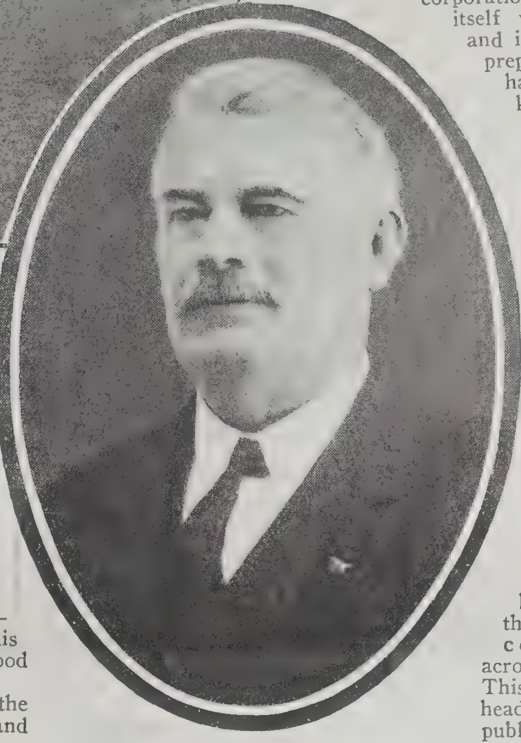


Main heading of one of the large irrigation canals, which, running below the California-Mexican border, waters 123,000 acres of cotton, and still carries water enough to run back across the boundary and irrigate many thousands of acres more in the Imperial Valley.

THE GREATEST handicap to the cotton industry, from the producer's point of view, has been the failure of the cotton men, be they growers, ginners, or brokers, to stabilize it. George Washington Jones, with a hundred acres of cotton down in Mississippi, may "make" a bale to the acre, and yet come out with red ink on the wrong side of the ledger when he foots up his year's activities for the inspection of the income tax collector. He may make less than half a bale an acre, and still show a good profit at the end of the crop. He may have a full production this year, and less than half a production for the next two years, and he may get twenty-five cents a pound for cotton which cost him twenty-six cents to produce, or forty-five cents a pound for the same cotton.

George's trouble is that he never knows, when he sets out in March to plant a field of cotton, what the September ginning is going to do to him. The reason is—and herein lies one of the fundamental causes of the unsatisfactory industrial and agricultural condition which has persisted in what is known as the "Solid South" since the end of the Civil War—that the George Washington Joneses, and the rest of the planters and cotton men, have not in all these years established a system of growing, preparing and marketing their cotton. And cotton is to the South what corn is to Kansas, wheat to Minnesota, or oranges to California. It is the greatest, best-adapted, most profitable crop the southern states can grow, and it is, more than all this, a daily national necessity. The man who stabilizes the cotton industry will be one of the greatest benefactors industrial America ever has had.

That is why an experiment in cotton stabilization which has been carried on so successfully that it will produce, gin and market more than 130,000 bales of cotton this year, is worthy of the attention of every one in this country who has the slightest interest in agriculture, production, transportation and distribution. The experiment—which is really beyond the experimental stage, but which always will be an experiment in improvement of methods of operation in the cotton industry—is being conducted on 800,000 acres of land in Lower California, one of the states of Mexico, extending from the southern boundary of California to the Gulf of California, and from the Cocopah Mountains on the west to the Colorado River on the east. This year there are 123,000 acres of cotton in this vast tract; next year there will be more, just as rapidly as the land can be cleared and the water conducted to it from the great canals which take part of the waters of the Rio Colorado and with them make the garden known as the Imperial Valley on the American side of the international boundary. These canals, as is well known, first pass through Mexican territory before they deliver their waters to the Imperial Valley, and the lands below the boundary are entitled to a certain share in these life-giving floods. By the use of this water a new empire is being developed on Mexican soil which has a number of interesting features aside from the stabilization of the cotton industry.



H. H. CLARK,

General manager of the Colorado River Land Company, who has been largely instrumental in finding and installing on the Lower California desert a crop which has proved a success on that soil. As a result, the 123,000 acres in cotton there this year will produce something like 130,000 bales of the staple, which has been planted, and will be picked, ginned, compressed and sold on the same basis as wheat or any other of the world's staples.

So much land has been provided and so much labor offered, for example, that there has been virtually no revolutionary movement in this section, for the simple reason that the revolutionary agent could find no foothold for his ideas among people busy at work at good wages.

So much importance is attached to the undertaking by the Mexican national and state governments that the seat of government of Lower California has been moved to the heart of the 800,000-acre area, to the town of Mexicali, where a new palace has been built for the governor, and where a considerable town has arisen on what some ten or twelve years ago was barren desert.

More than 12,000 Mexicans are at work on the 123,000 acres of cotton, and on the 70,000 or more other acres which are being variously cropped to alfalfa, sugar cane, and so on. This is approximately ten per cent of all the men ever engaged at any one time in any revolution in Mexico, both federal and revolutionary troops. It is probably, also, very nearly one-tenth of the number of men in the entire Mexican state of Lower California. It is estimated that at least three persons are dependent on each one of these workers for a livelihood, and, considering the size of families among Mexican working people, this seems a most conservative estimate. It means, however, that 36,000 persons are deriving a living in a foreign country from an industry established and maintained by Americans.

These matters, along with a number of others of almost equal importance, are, however, beside the question of cotton and its stabilization. Important as they are to both Mexicans and Americans, they are of less value to the world than the putting of the cotton industry on an even keel; the establishment of the cotton planter on a solid financial and industrial footing with the wheat-grower or the orange orchardist; the systematization of the distribution of cotton; and the perfection of preparatory methods for cotton between the producer and the consumer. These things have been accomplished in this, the greatest cotton-growing project ever attempted. The financial resources and the industrial direction of the huge agricultural establishment are provided by an American corporation; the labor supplies itself with such promptness and in such abundance that preparation of the land has been barely able to keep pace with the influx of workers, proving that, in Lower California at least, the Mexican prefers work to war; and the largest cotton-ginning plant in the world is now in operation every day in the year taking care of the crop.

The American corporation is the Colorado River Land Company, with present headquarters in Calexico, California, but which is preparing to erect a large office building in Mexicali, the town created by the cotton industry, just across the line in Mexico. This company, which is headed by Harry Chandler, publisher of the Los Angeles *Times*, and H. H. Clark, general manager, owns 832,000 acres of land abutting on the international boundary, and extending southward therefrom to the Gulf of California. Of this huge area, fifty miles north and south by more than half as much east and west, 200,000 acres are "working," that is to say, under cultivation. Of this cultivated acreage, 123,000 is in cotton. The average production of this cotton plantation is three-quarters of a bale an acre, as compared with an average in the cotton-belt of the United States of 47/100ths of a bale an acre.

Driving through this great plantation, as I did a few days ago, one sees a continuous carpet of green, now about a foot deep, to a reddish gray soil, the silt deposits of ages from the tireless waters of the Colorado River. This year, when this carpet of green turns to a blanket of white, from 125,000 to 130,000 bales of cotton will be picked from it, for the cotton is now beyond danger of frost, and there is no boll weevil in all the spread of land.

The systematization of the cotton industry begins here with the soil. With the canals ready to pour their crop-producing waters on what was once a barren bit of the Colorado Desert, the land is leased to individuals who are able to show that they are industrious and honest. The matter of the possession of money is not the question, and the man who will make his acres produce is the man who gets the land. The first lease is made for one year, with privilege of renewal for five years, so that, before a long lease is entered into, the agricultural and cotton experts of the company have time to learn just what manner of man is the applicant for the longer term.

This year there are 154 men leasing these cotton lands, some of them having as high as 9,000 acres, others as low as 100. The leases are paid for out of the crop, and their methods of seeding, irrigation, cultivation, as well as their expenditures for labor, are watched and guided by agents of the corporation owning the land. When necessary, money is advanced to these leasors and they are given every aid in making every acre produce its absolute agricultural limit.

From time to time during the planting and the growing seasons, men who know the cotton industry

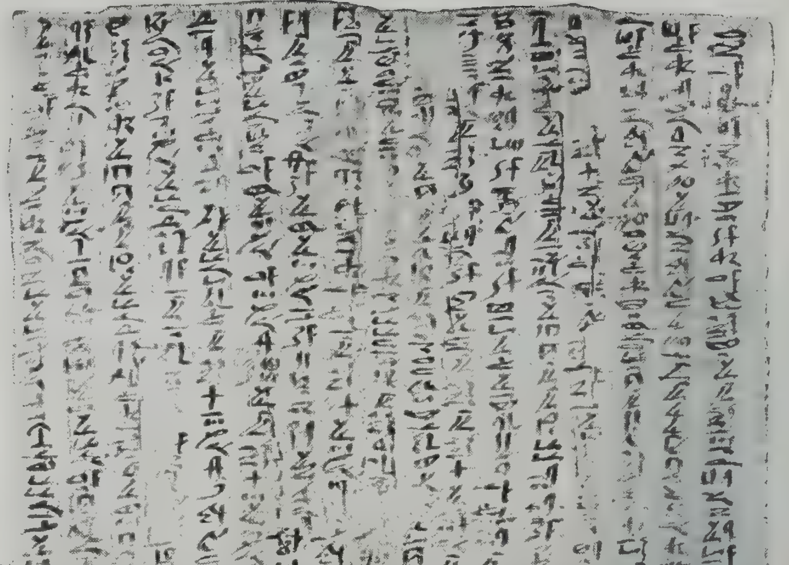
(*Concluded on page 11*)

A few thousand bales of Lower California cotton in the yards of the largest cotton gin in the world, at Mexicali, Mexico. This gin has a capacity of 400 bales a day, and this year about 130,000 bales will pass through it. That is to say, it will be busy every working day.

The Oldest Letters in the World

Four-thousand-year-old Missives Shed More Light on Ancient Egypt

By J. OLIN HOWE



Photos Courtesy of The Metropolitan Museum of Art.

The first page of Hekanakht's first letter from Memphis to his household in Nebesyt.

Excavating the tombs of the Pharaohs is a matter of real engineering.

CHANGES in human nature are really inconsequential through the ages. The Hekanakht letters were written in Egypt 4,000 years ago, and they might have been written last year, except that their language is more formal and much more flowery than would be used now. Otherwise they are not so different from what the rather fussy head of a family might write today to the eldest son in charge of his affairs in his absence. Yet these are the oldest private letters known to exist.

They easily hold the interest, with their constant reminders to the son Mersu and his brothers that they are eating their father's bread, that "everything is his and the whole household is dependent on him." "Do not fail to answer about everything I have written thee about," insists old Hekanakht, "for see, this is not a year for a man to be negligent toward his master, or his father, or his brother."

And these letters shed welcome light on the daily life of that remote time, with their comments on domestic squabbles and their injunctions as to love affairs, business matters and farm problems. They were discovered last year by American archeologists in the dust of an Egyptian tomb where they have lain undisturbed for forty centuries, since being carelessly thrown, rumpled and torn, into the scrap baskets in which they were found.

These came to light not far from the tomb in which Tutankhamen lay amid sumptuous magnificence, but furnish a clearer commentary on the Egyptian life of an even earlier day than do the king's burial surroundings. And there is a definite thrill in such personal epistles, written on papyrus now stained and worn but still entirely legible to him who can read the script in which they were inscribed.

While they lay sealed within the tomb, empires and even civilizations have risen and fallen into decay. How changed the world into which these familiar, gossipy writings, tossed aside in the days of Abraham, are come to find their place in an American museum.

Hekanakht was a garrulous old farmer-priest who lived in the reign of Mentuhotep V, in the early 2000's B.C., five hundred or more years before the Pharaoh Tutankhamen was born, and had his home at Nebesyt, near Thebes. He was a man of substance, head of an extensive household, whose fields bore rich yields of grain after the overflow of the Nile had receded for the season.

But the old fellow had need to be from home no little time, looking after estates near Memphis in connection with his stewardship of the tomb endowment of a dead friend of wealth and influence. For Hekanakht was a "Ka-servant," appointed by this friend Ipy, a great court dignitary, to perform those offices which should make easy the transition of the latter's "Ka" or soul from this life to that of the world beyond.

To the Egyptian of old this was ever the crucial problem, his great fear being that through some omission or lack of care his soul might not make the passage over safely, or dissolution of the earthly body might come ere the soul had ceased to need it, or insufficient provision be made for its requirements in the other world; and thus his homeless "Ka" be doomed to oblivion.

So if he possessed the means, before he left this life the Egyptian endowed his tomb, built beforehand on a scale to accord with his social and financial position, with such estate as made possible the perpetual performance of rites and offerings to secure his soul's future welfare. And the tomb priest named as his Ka-servant, because of his knowledge of mortuary ceremonies, became also manager of these tomb properties.

Yet how could Hekanakht, off down the Nile in the north of Egypt many months at a time, be on hand at the tomb back of Thebes for the required services when New Year's came, or the Wag Feast and the Festival of Thoth and other holy days? Some of these called for day and night attendance and at times the Ka-servant must camp out at the tomb for days on end. What could be easier than that the old chap should appoint his first-born Mersu, already responsible for his household and much of his earthly welfare, his substitute Ka-servant, to carry on in his stead?

Which is precisely what Hekanakht did. And when Mersu went to Ipy's tomb at the appointed time for the ceremonials, he took with him letters and memoranda that had accumulated at home, with which to occupy himself between services. Some of these he crumpled up and threw among the litter on the floor of an empty tomb in which he camped, and thousands of years later we gather them up "to suddenly meet," in the words of the archeologist who made the find, "the Theban Ka-servants when they are thinking of something far different from the religious rigmarole the tomb pictures always make them recite."

This empty tomb was that of Hesem, a retainer of Ipy's who survived his master. When Hesem finally came to require it, the priests swept his tomb of rubbish and the tools and waste material left by the stonemasons, the while reciting powerful incantations to remove even the footsteps of evil spirits before the door was sealed forever, crammed all into scrap baskets and thrust these into a hole in the passage leading to the vault below.

And there they have remained the long time since. Native plunderers, who made rich hauls in these tombs, were interested in no such trash.

Among the letters is even one which was folded and sealed when found, addressed to Hekanakht's overseer, Ranefer. Mersu either threw this aside by mistake or had some reason for not wishing Ranefer to receive it. And along with them are inventories of the father's property drawn up by the latter in course of setting his affairs in order ere he went away, as well as accounts of Mersu's own which showed how he had cared for his trust.

Hekanakht had called in Mersu and his two other grown sons, Sinebnut and Sihathor, and his head man, Heti, son of Nakht, and had taken stock of his interests on a fresh sheet of papyrus, first writing the date, "5th. Year of the Reign, 2nd. Month of Shomu (the harvest season), 9th. Day," which we would write October 10, 2004 B.C.

Then he wrote, "Statement of Hekanakht's barley," with the subheadings, "Made over by him to his son Mersu," "Fodder for the bulls," and "The barley Hekanakht has obtained for his dependents," and duly itemized all this, with the amounts of spelt, an inferior grain worth but two-thirds as much as barley, written in red to prevent errors in addition.

This is the inventory of which a photograph accompanies this article. Next comes a "Statement of bulls that Hekanakht has made over to his son Sinebnut," with thirty-five of these listed under five different breeds. This note follows: "But if Sinebnut appeals to me about any bull that is missing . . . . half the loss shall be upon him and Heti, son of Nakht."

The inventory accounts for much other property and winds up with a "Statement of bread given to Mersu, son of Hekanakht," which accounts for 7,000 loaves of it altogether, of three different kinds. Even today in Egypt they bake far more seldom than we do and their hard little biscuits keep a long time.

In the first letter to Mersu he asks that some of this grain be sent him at Dedisut, near Memphis, and tells the son what to do if "it turns out to be a good Nile." The river must have begun to rise and Mersu, busy cultivating the crops, feared the dykes might burst and the fields be flooded before he could reap them.

His father's mind is too full of this for those rhetorical greetings which gave Egyptian letters real distinction and he dashes off this note:

"The Ka-servant Hekanakht addresses Mersu:

"As to any flooding on our land, it is thou who art cultivating it. Woe to all my people with thee! I shall hold thee responsible for it. Be very active in cultivating and be very careful. Guard the produce of my grain. Guard everything of mine, for I shall hold thee responsible for it."

Mersu need not have worried. That year's Nile turned out a bad one, so low that the harvest was poor and meager, and when the next of these letters was written famine stalked abroad. In this Hekanakht writes the proper salutations, thus: "The son speaks to his mother; the Ka-servant Hekanakht to his mother Ipy and to Hetepet: How are you in your life, safety and health, by the blessings of the God Montu, Lord of Thebes?

"To the whole household, how are you? How are you in your life, safety and health? Do not worry about me; I am alive and well.

"Behold, you are as one who eats until he sates hunger, until he shuts his eyes, while the entire land is dead with famine.

"I have come hither southward, and I have obtained your victuals as well as possible. Is not the Nile very low? Well, behold, we have obtained victuals in proportion to it. Be patient, you who are named, for you see I have been able to support you up to today." He follows with a list of those for whom he is sending rations and their respective shares.

"Now you must not be angry about this. See, the whole household are dependent on me and everything is mine. 'Half-life is better than dying altogether' and they say 'the hungry must hunger.' Why, they have begun to eat men and women here! There are none anywhere else to whom such victuals are given. You must keep yourself going until I reach you."

In the same letter are these special instructions to Mersu and Heti: "You must give these victuals to my people only while they are doing work. Mind this! Make the most of all my land; strive to the uttermost; dig the ground with your noses in the work. See, if you are industrious, one will praise God for you. Lucky that I can support you."

The glimpses of the family life, the inner view, which run through these letters, give them strong appeal. For example, the third son, Sihathor, seems to have been somewhat lacking in proper filial feeling and his father writes as follows of a suggestion he had evidently made to Mersu: "As to sending Sihathor to me with old, dried-up barley . . . . and not giving me the 50 bushels in new barley—by no means! But thou art happy eating the good barley. 'I am on land and the boat is well moored, but when thou puttest ashore thou doest everything wrong.' If thou shouldst have sent me old barley to do duty for new—but what am I saying? Much good it is!"

"Take great care of Anupu and Sneferu," writes Hekanakht, "whether thou livest with them or diest with them. Mind this! I have been told that Sneferu is discontented. Thou must send him off to me directly thou hast cultivated."

These letters were written four thousand years ago. Don't forget that.

World in Pawn to Single Family

A Visit to the Rothschild Home in Frankfort

By PAUL TYNER

NATHAN M. ROTHSCHILD

JUST now one hears less of the doings of the Frankfort and the Vienna Rothschilds. The family which was without a surname until Mayer Anselm of the tribe adopted that suggested by the red shield and the three golden balls, sign of his trade as a usurer, which hung over the door of his home and pawnshop in the ghetto of Frankfort-am-Main; and without fortune until his son Nathan made his first grand coup on the London Stock Exchange by playing the market on the strength of his clever scoop of early news of the result of the battle of Waterloo, is now firmly established in the ranks of the nobility of France, of England, of Austria and of Germany. With scions of royalty and nobility dating from the times of the Plantagenets and the Tudors, the name of Rothschild has obtained proud space in the current "Almanach de Gotha." Yet, as all the world knows, this "rank and social esteem" which thoughtful economists tell us is the real goal for which millionaires strive, is but an incident in the rise of the house of Rothschild to world domination in the realms of international finance; finance that has many ramifications in international and national politics, trade and industry.

I have spent an interesting half-hour in the very house that saw the humble beginnings of all this greatness: the house in what was formerly the "Judengasse" of Frankfort and in which Mayer Anselm was born and spent the first thirty years of his life; the house in which he was married, in which his ten children were born and from which they went forth to conquer the earth. The house is still owned by the Rothschilds and has been carefully preserved as a sort of shrine to which their descendants and admirers may make pilgrimages from the four quarters of the world which they hold in pawn.

The house is a substantial dwelling of three stories, of which the ground floor is of stone and the upper floors of cement beamed in oak. Although narrow, it must have been a comfortable domicile of the bourgeoise type. The room which anciently served as a counting room on the ground floor is now closed, being used for a storeroom. Ascending a narrow stairway, one enters what was the family sitting room which looks out on the street. The young woman in charge was evidently accustomed to receiving visitors, and pointed out the family portraits still hanging in this room, as well as the writing table of the first of the Rothschilds. In a back room, plainly an addition built on to accommodate the growth of the family, I was shown a high bookkeeper's desk and a cabinet, which also formed part of the original furnishing. The humble caretaker and guide, who turns an honest penny in the way of tips and the sale of copies of the Rothschild family tree and the photographs of the house itself, of the ghetto quarter before the recent improvements, and of the ancestral portraits already mentioned, told me that she and her mother were modest members of the same great family—a sort of pensioned poor relations!

The readiness with which my taxi-driver took me from the station to "the Rothschild house in the Judengasse," would seem to indicate that it is a frequent destination of visitors—indeed one of the sights of Frankfort. But, as a matter of fact, there is no longer a "Judengasse." The quarter which for many years bore that name has practically been swept away, large business buildings having been erected on the former site of the narrow and tumble-down houses of the old-time ghetto. Several old Jewish families of the wealthier middle class still live there, however, and the old synagogue which Mayer Anselm and his family attended is still standing.

Most of the houses neighboring the Rothschild home, which is now known as No. 26 Bornestrasse, are of much later construction. It need hardly be said that the Frankfort Rothschilds of the present generation inhabit much more lordly palaces in the more fashionable quarters of the city. Curiously enough, although Frankfort long since lost its former prestige as a money center to Hamburg, with the remarkable growth of that great German port, the ancient city on the Main here is still regarded as the main stronghold of the Rothschilds. It is from Frankfort, for the most part, that the strings are pulled that control the bourses of Berlin, Hamburg, London, Paris, Brussels and Amsterdam—not to mention New York, Chicago and San Francisco, Melbourne, Capetown and Bombay.

A little study of the only available family tree, brought down to 1899, reveals several interesting facts.

The house at No. 26 Born-strasse, Frankfort, in which Mayer Anselm Rothschild and his ten children were born and which is preserved by the family as a sort of shrine and museum of family relics.

In the first place, there is a surprising number of intermarriages among the Rothschilds. To keep the money in the family, a Rothschild heiress is seldom allowed to marry any but a Rothschild. Departures from this tradition are usually significant of the capture of compensating advantages in the way of alliances with the European nobility, of which the marriage of Hannah, daughter and heiress of old Nathan Mayer Rothschild, with the Earl of Rosebery (who soon after became Prime Minister of England) is an outstanding example. Several of the Frankfort Rothschilds made brilliant matches. Of the six daughters of Carl Mayer Rothschild (granddaughters of the founder of the house) two died unmarried, two married Rothschild cousins and the remaining two married French nobles, Margaretha wedding Agenor Duc de Gramont and Bertha-Marie marrying Alexander Berthier, Prince and Duc de Wagram.

Of the Vienna Rothschilds, Anselm Salomon and his sister Betty both married in the family, and of the five of Anselm Salomon's eight children who married, four wedded in the family and the fifth married an Italian nobleman and banker, Raymondo Baron Franchetti. Yet only one of old Mayer's children married a Rothschild, the remaining contracting alliances with the Sterns, Cohens, Worms, Beyfus (two sisters Rothschild married two brothers Beyfus); Herz, Hanau, Sichel and Montefiore.

Turning to the English branch, we find that the Rosebery match does not stand alone. The aunt of the Countess of Rosebery, who was also named Hannah, married Henry Fitzroy, cadet of a ducal house. Two granddaughters of the Nathan of Waterloo fame married into the nobility: the first, Constance, becoming Lady Battersea and the second, Anna, marrying the Honorable Elliot York, fourth son of the Earl of Hardwicke. Jacob, the son of Mayer Anselm, who became the head of the Paris branch of the house (changing his patronymic to James and being made a baron by Napoleon III), has had a numerous progeny, eight children and ten grandchildren. But most of them are married within the family. The exceptions are a son, Gustav Samuel James, who married Cecilia Anspach and granddaughters who married respectively Maurice Ephrussi, Edward Sassoon, father of the present Sir Philip Sassoon, Baronet, trusted friend of Lloyd George; Leon Lambert, Baron Leonina, and the Belgian, Baron van Zuyten van Nyevelt.

The family tree has much more than an interest to the dilettante curious in matters genealogical. It represents symbolically the greatest consolidation of wealth and worldly power in the hands of a single family that history has recorded since the days of the Borgias.

View of the old "Judengasse" of Frankfort taken a few years ago while the quarter was in process of demolition to make way for modern business structures. The birthplace of the founder of the Rothschild house is indicated by the arrow. On the left is seen the synagogue that Mayer Anselm Rothschild attended and which is still standing.

How the Public Asks Its Questions

THE Peterkin Papers of our childhood, when we come to think about it, were based on solutions for foolish questions. Whenever the Peterkins saw no way out of their numerous household difficulties, they ran across the street to the all-wise Lady from Philadelphia. She immediately brought her superior intelligence and experience to bear and solved the domestic riddle.

Who is taking the place today of the Lady from Philadelphia? With varying results each one of us seeks the elusive answer from some source or other whose only recommendation usually is its propinquity. A man normally drops into the nearest drug store and expects the clerk, a graduate in pharmacy alone, to furnish first-class information on any kind of a topic. A woman sits down at the telephone and calls her dearest friend.

Commercial groups, even, have sprung up in an effort to take the place of the Lady from Philadelphia. These organizations are often extraordinarily efficient in their particular lines. All are too limited in scope, however, to satisfy our countless calls for information.

"Ask Mr. Foster" has branches all over the United States. "Mr. Foster" plans trips, furnishes time-tables and recommends hotels for any place under the sun. To be sure, Mr. Foster himself is presumably off at lunch or has just stepped out, but his place is taken by a most competent young woman.

Tel-U-Where is another commercial information agency in the large cities. Its aim is to furnish to inquirers over the telephone the names and addresses of firms which carry the product one desires to inspect or purchase. In its policy is incorporated the old telephone idea of "The Voice With the Smile Wins." All Chambers of Commerce have a similar service in their programs.

Many other forms of commercialized question-answering exist, but all lack the neighborly note which one wants when one gets to the state of asking for information. Take, for example, the information window in the average railroad station. Many are the times I have stood in line at these so-called information bureaus, with suit cases poking in my calves and umbrellas in my sides, waiting my turn to be snapped at and to be sent off unsatisfied. Many also are the times when I have in desperation boarded a street car going in any direction thinking to myself, "It is worth a nickel to get the conductor to put me straight." Almost equally often have I had the conductor say, "I can't tell you, lady; I've just come here from Nova Scotia."

All of us can add to the list of question-answering agencies, and the call for such agencies, from our own experience. It is a great human need made more urgent by the complexities of modern life.

Imprint of Moors Even on Spanish America

Streets and Houses Betray Influence of Orientals on the Spanish

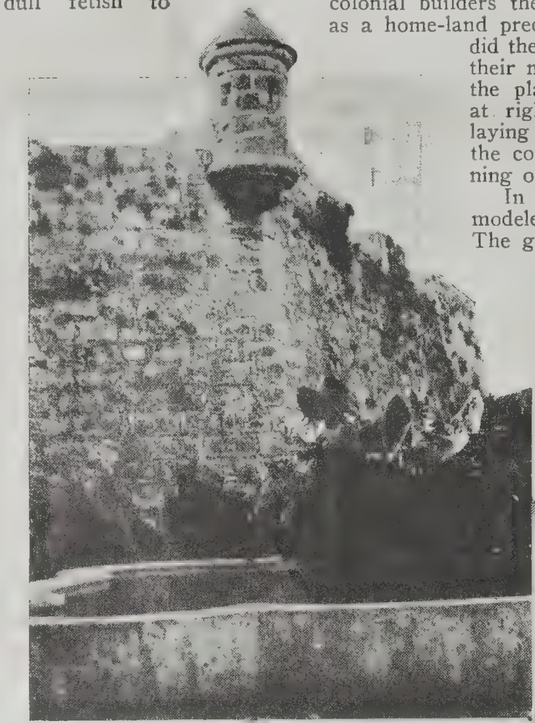
By CARROLL K. MICHENER

This is one of several travel articles by Mr. Michener

THE MOOR brought into Spain his harem and his house, and left them as imperishable souvenirs of his seven-century régime. They are today no less distinctive of Spanish life—the one persisting as an attitude toward women and the other as an architectural standard—than bullfights and the fragrance of garlic. They have been so interwoven into the national fabric as to seem Spanish themselves. Without them half the characteristic and and distinguishing charm of old Spain would be gone; stripped of its Moorish inheritance, the Iberian peninsula would be but a dull fetish to imagination and romance.

And what the Arab carried with him across the straits from Africa—his Oriental concept of the sphere of woman and his blank-walled houses to shut her away jealously from a spying world—the adventuring Spaniard scattered into another hemisphere. In some of its most striking attitudes, therefore, Spanish America is Moorish America. Its Oriental quality is visible instantly to one who is familiar with outward aspects of the East, and its Afro-Asiatic philosophies of life come more definitely into vision with nearer acquaintance.

A man's dwelling house, like the garments with which he protects his body, betrays his tendency of mind. The habitations of those who inherit Moorish tradition mirror an Oriental distrust, both of things exterior and within. The forbidding walls, adjoining others along the narrow canyon of a Spanish-American street; the massive, brass-studded, steel-bolted doors; the iron-grilled windows—these are at least symbolical, if no longer wholly actual, barriers against him who would enter and her who would emerge.



Moorish bastion and fountain in Havana's old fortifications.

The Moor in Arabia made his streets narrow to outwit the blistering sun. The parching summers of Southern Spain seemed to him to require the same expedient. In such a city as Seville, therefore, one may walk through principal thoroughfares no wider than those of Morocco, capable of being cut off from the sun at midday by means of short tongues of awning stretched out from one house wall to another. Even in Toledo, most northerly of the Moor's outposts, where summer brings fainter reminiscence of the desert's breath, there are the same attenuated, occluded streets.

It is less remarkable that Spain should have retained this visible impress of its Mohammedan conquerors than that the exotic mold should have been passed on to the New World. The fact is proof of the thoroughness with which Moorish ideas had found permanence in Spanish thought. Arabian architecture had become a habit of mind.

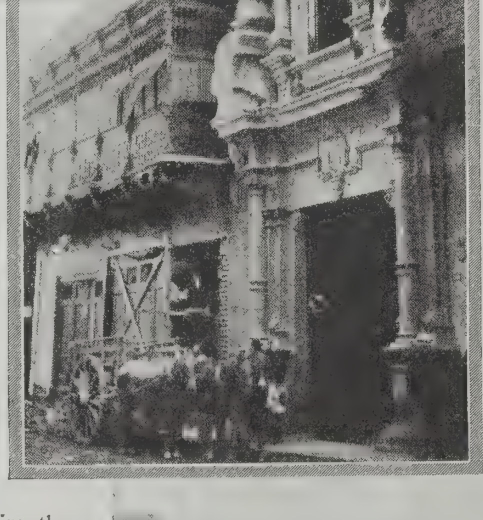
Evidence of this lies in the persistence with which the Spanish colonists in South America have clung to the Moorish *patio,* so unsuited even to the tropic latitudes of the high Andes. There was logic in it so far as Mexico and the islands of the West Indies were concerned, although American experience in Panama with wide-verandahed frame buildings, screened and opened frankly to the four winds, is setting a new example of comfort there. The Spaniard of the Conquest, however, was from Southern Spain, and it is too much to expect of him that Havana, even in modern times, should be otherwise than an architectural suggestion of Seville.

There was room in the wide New World for ample streets. The North Atlantic colonists, although there were cases of rare foresight among them, realized this none too well; and as for Spain's city builders in the Americas, they seemed to understand it not at all, although they were generous in providing for that inveterate Spanish institution, the *plaza.* Except for an occasional *alameda* or boulevard, belonging usually to modern times, the West Coast cities are exceedingly narrow of thoroughfare. They were laid with no prescience of a traffic the space requirements of which would be greater than the "beam" of a panniered donkey.

Trolley cars and automobiles have grievously put to task this unforeseeing parsimony of the colonial city builders, and the conventions of modern paving have sometimes brought humorous results. So narrow are many of the streets that, when freeway for a single vehicle of four wheels has been provided, there is often little or nothing left for sidewalks. It is not uncommon, therefore, for the walk to diminish at points until it is little more than a curbstone, or in places to disappear altogether. In many of the most populous business avenues it is impossible to proceed upon these footpaths otherwise than in Indian file.

Inca cities, if the historians are to be credited, were not much different in this and other respects. Their thoroughfares were narrow and their walls blind. The colonial builders therefore had an indigenous as well as a home-land precedent. In only one major regard did the Spaniards consciously depart from their municipal tradition, and this was in the platting of straight streets, crossing at right angles. Thus, Pizarro, in his laying out of Lima, and Valdivia, obeyed the command of Charles V, in the planning of Santiago.

In recent years South America has modeled variously in its house building. The great show streets of Buenos Aires are more suggestive of Paris than of Seville. They have a mingled touch of all Latin countries, and by no means an uncertain element of the Anglo-Saxon. The dwelling house, nevertheless, is generally of the Spanish-Moorish type that turns itself outside in, smiling upon an interior court rather than upon the exterior world. Plastered adobe is as much of a standard as stucco and shingles in the United States, and the *patio* is as prevalent as the North American porch.



The Spanish-Moorish balcony and arch persists even in the principal streets of modern Buenos Aires. Right—Famous balconies of the old Torretagle Palace in Lima.

Not until one has seen the Alhambra does he understand how strong is the classic tradition that supports this ideal of house building. There is rude strength, not beauty, in the walls and towers that rise upon the citadel-hill above Granada. They were built not alone to repel the invader, but to conceal from him the splendors within. Moorish jealousy kept the women of Boabdil's harems aloof from sight or sound of the outside world, like doves caged in arabesque balconies open only to sky and the shy secrets of imprisoned fountains and foliage. Moorish mistrust kept his treasures of tracery and mosaic invisible and unsuspected from without.

Supported by such a prototype and by the common usage of Mohammedan Spain, South American architecture has no difficulty in explaining itself. There has been less of a tendency toward modification to suit environment, as in the Spanish-Mission houses of Southern California. Nuances have not been lacking, however, and such variations seem more pronounced than most of those old Spain has permitted herself to develop. These are in general an ornamentation of the Moor's bare outer walls, or a compression of the *patio* into some such modern formality as a glass-roofed sun parlor. In the capitals—particularly in Buenos Aires—the Spanish-Moorish architecture of colonial days is looked upon, quite naturally, as a bit old-fashioned, and there is an increasing vogue for French and Italian design. The old motive strongly persists, however. It clings, if not in lines, at least as an atmosphere, to the borrowed architecture of Latin Europe.

When one has seen Seville he knows the paternity of Lima's balconies. The men of Pizarro's expeditions were chiefly from Andalusia, and Seville continued to be, in more senses than one, the home port to which Peru's "City of the Kings" paid tribute. The balconies of Lima, however, seem more prevalent than those of the paternal city, and certainly they are more ornate.

Travelers are not likely to miss a supreme example of this art, one of the show places of Lima—the old colonial residence of the Torretagles, of late the Ministry of War. Its balconies, hanging massively from the second story, are a monumental exhibit of the craft of wood carving, today unfortunately in eclipse.

The balcony, like the iron-barred window of the ground floor, is a compromise with the Moor's exclusiveness. It is a sheltered loophole from which the impounded women of his domicile may take vicarious part in the world of adventures passing by. Seeing, but at will unseen, the inmates of the harem may look forth upon pathways of life that are for them forbidden.

More romantic, of course, is the *mirador.* This is the first-floor window, flanking the entrance and opening upon a parlor where women of the house set themselves up, as in a play-box, to view the affairs of the world. Here there is the scene, prescribed by tradition, for courtship and betrothal. Outside the window bars sings Don Fulano, posing and proposing to the glamorous figure behind wickets of steel. Inside he may sit with her, amply chaperoned, only after he has committed himself and he has become her affianced.

The *mirador* is no other than the African moucharaby, latticed and projecting slightly into the street. Through it, when days and nights are warm, one may catch intimate glimpses of Spanish-American life, though this is peculiarly paradox to the general exclusiveness of the Iberian home.

In some of the older streets of West Coast cities, of Lima especially, many a fine old Spanish house has descended to commercial usages. The *mirador* has become shop entrance, or a shop window, and it is admirably adapted for either. Charming *patios* of other days have been converted into warehouses or echoing repositories of some industrial pursuit.

The balcony is to be found, of course, in nearly all Spanish-American cities, although it is most pronounced in Lima. In La Paz and Santiago it is more like that of Spain, a small grilled-iron basket seldom large enough for more than a row of potted plants, and perhaps a woman's face peering through.

A development of this architectural theme is the arcade, which characterizes so many business thoroughfares of the Spanish world. Projecting to the edge of the street, the balcony, in such a case, is supported by arched masonry that partially incloses and shades the walk. Not infrequently the affairs of those who occupy the buildings overflow cumbrously into this protected space. The older *plazas* hold tenaciously to this tradition, of which Arequipa affords a thorough example.

Essential to the Moor's felicity is water. His paradise plashes with a myriad of fountains. To some degree his wealth is to be measured by the amount of water he possesses—his reservoirs and canals, and the size of the oases and gardens they water. The *patio,* therefore, is another unquestionable Moorish inheritance. And something essentially Oriental gives character to the dense and usually tropical foliage of this walled oasis visible through iron gratings along any residence street of the Spanish world.

Usually there is a somewhat harshly tiled flooring, and the shrubs seem a bit formal and

The balconies of Lima

crowded, but undeniable freshness and beauty inhabit even the poorest of these conventional gardens. A fountain is something of a luxury along the dry West Coast, but there is never a visible lack of water enough for irrigation. The foliage is varied, ranging from creepers and common garden flowers to shrubs and small trees. Some household pet usually inhabits the *patio,* and rarely is this leafy retreat without the song of a bird, either captive or at large.

In accordance with Moorish convention, the principal rooms of a house open upon the *patio* directly opposite to the entrance, with smaller rooms along the sides. Here, again, the balcony and the arcade come into play. The agreeable coolness and colors of the garden invade these rooms, which not infrequently have no exterior opening. They are high-ceilinged and restfully shaded.

This is an arrangement, however, that is eminently more suited to conditions of life and climate under which the Arab originator developed it, than to much of Spanish America. Winter seasons of the Andes, and even some nights of summer, bring cold blasts and draughts into the *patio,* some part of which must be crossed in going from one room of the house to another. Rarely, too, is there any amelioration of these conditions in the use of artificial heat. Stoves and plumbing are alien not only to the Moor's tradition but to the race that yielded so largely to his tutoring of seven centuries. Indeed, there is no place for these modern foibles in his scheme of things. Plumbing would be as subversive as turning the house inside out and making the *patio* into a porch, and even the cookstove is as likely to be found outside the dwelling, at some indeterminate point in the rear, as within. In the close-shut rooms of winter an occasional kerosene stove does what it can to ward off discomfort and pneumonia.

The Indian of Inca times built many of his walls of unmortared stones, so nicely fitted that even today—as no one who writes of South America can resist the trite temptation to remark—it is impossible to insert between some of them "the blade of a sharp knife." The building material of the present, however, is an adobe of mud and straw. Wood is little used, since it must be imported, usually at a greater cost than materials nearer at hand. This is a rule that has its exceptions, however, in some of the cities of the west and north. Whole blocks of Antofagasta's business section are redolent of Oregon pine.

The plastered outer surface of the conventional house of Moorish type is in at least some variant of white, although there is a pronounced tendency, as in the Spanish peninsula, toward more decorative tints. Nothing can quite equal the riotous pinks, greens, blues and yellows of Portuguese Rio de Janeiro, but most South American cities can exhibit something of a pale likeness of such chromatic glory. The walls of Havana—light yellow, orange, pink and pallid-blue—gave the index to this system of house colorings, and it is carried out to a greater or lesser extent southward.

There is further devotion to these tints within the house, in the tiles of the *patio,* the occasional mosaics, bits of stuccoed lattice, and upon the plaster of the high-walled rooms. Not infrequently the brilliance of paint and gilding goes far toward mirroring the classic precept of the Alhambra.

The house of the Moor, generally, was of one story. The Moorish-American type does not often go above one, and rarely, along the West Coast, is it more than two. Whatever the height there is a general preservation of the Morisco flat roof, the Spanish *azotea,* often the family sitting-room in the cool of evening.

Some of the more cosmopolitan of the South American cities are drifting away from this style, but even in Buenos Aires it survives to a notable degree. One's hotel window is likely to overlook apartment houses, the flat roofs of which are gardened and terraced and given over not solely to the activities of washerwomen hanging out clothes but to the family's amusements.

The frequency with which disastrous earthquakes occur along the narrow western fringe of the Andes has kept the houses there modestly low—this would be reason enough without the additional one of tradition. In Lima they are generally flat as well, so that the city has both these similitudes of Arabia. The same is true of Arequipa. There is many a house of Moorish design in Santiago, but La Paz has undertaken a sharp departure toward the more graceful curves and angles of red-tiled roofs.

The Saracenic significance of the flat-topped house does not persist, of course, in Moorish America. In Fez the housetops are taboo to men—sacred, indeed, to women, who may bare their heads there and lay aside the *chumur,* which is the *manto* of Spain. But the flat roofs of South America are by no means hallowed to the uses of woman, though they are part of her restricted sphere.

Even though the Moorish-American house abuts directly upon narrow streets, wasting no space in lawns and driveways, its site, owing to its *patio* and its one or two stories of height, is necessarily large. This has its definite effect upon the character of South American cities, particularly of the West Coast. They are spread over large areas, and often seem to the North American eye far more populous than they are in fact. Should the Morisco type of architecture persist, the great cities of tomorrow will be extensive, indeed. But ponderous as is the inertia of Moslem tradition, it is yielding to the influence of the Latin-American's varied foreign preceptors, and the South American city of the future is quite as likely to be some such architectural melange as the Buenos Aires of today.

Above—A fantastic mixture of Moorish and modern architecture in Rio de Janeiro. Left—The walls and balconies of Cuzco, Peru. Right—Bolivian mansion of the more highly ornamented Spanish-Moorish type.

A modern variant of Morisco architecture, Buenos Aires.

One Hundred Thousand Acres of Cotton!

Concluded from page 7

from beginning to end are sent out by the landowning company. These men inspect the plantation of every leaseholder. If he has any problems, they furnish him with solutions for these problems. If he has trouble with planting, cultivation, irrigation or harvesting, they show him the causes of these troubles and apply the remedies. Distribution of labor for the various jobs connected with the production of cotton also is supervised, so that every leaseholder is certain of the necessary amount of labor to handle his crop from beginning to end.

When the crop is picked—and it is interesting to note that Mexican labor has been found better adapted to this work than even the historic Negro from the cotton fields of the South—the loose cotton is piled into trailer wagons, each holding 6,000 pounds net. A tractor picks up eighteen of these wagons, or 108,000 pounds of cotton, and hauls it to the largest gin in the world at Mexicali. This use of the tractor and the trailer-train is an economic feature of the systematization of the cotton industry which has proved of great value. To handle the eighteen trailers with their 54 tons of cotton, would require two men and six mules to every two wagons, if the old method were followed. That is, eighteen men and 54 mules would be required to haul the equivalent of one of these trains to the gin. But the tractor makes two such trips a day, whereas the mules and men could make only one trip, the distance at present being about 11 or 12 miles. Therefore, the tractor each day, with two men to operate it, really does the work of 36 men and 108 mules. These economies of operation are manifest throughout this establishment, and the leaseholders are taught to use them in their daily work and in their direction of the men whom they employ.

A network of canals, 600 miles in total length, provides water for these lands, and it is a drive of 402 miles around the cotton fields. Even the operation of the canals is conducted like a huge department store, with upkeep, management, direction and distribution of the water handled by a force of men, mainly Americans, who do nothing else. The total cash cost an acre of irrigation of these lands this year will be $3.13. The highest rate paid in Mexico for water is $2.08 a cubic second-foot, and the lowest 75 cents a thousand meters, or $1.83 a cubic second-foot. Water sold to Mexican lands in 1922 reached the huge total of $469,740, while those in the United States (Imperial Valley) are put at $788,952 for the same period. There are indications that the water sales south of the boundary will equal, and possibly surpass, those on the northern side within the next year or two, under the present systematic development of the cotton industry there.

When the tractors with their eighteen-wagon trains of cotton roll into Mexicali, they are unloaded by suction pipes into a gin capable of producing 400 bales of cotton a day, the largest and most continuously operated cotton gin in the world. To handle this year's crop of 125,000 to 130,000 bales of cotton, this gin will have to be operated virtually every working day of the year. And no part of the boll escapes from this gin. The seed is converted into oil, except such quantities as are needed for next year's seeding; the hulls are sold for fertilizer, and the cotton shipped in solid train loads to the markets of the world. One of these days, when the cotton area has grown greater, there will be a port on the Gulf of California, to which ships will come direct to load cotton from this vast plantation. Even now, preparations have been completed for the construction of a railroad southward from Mexicali some 60 miles to the point on the gulf at which this port is to be located. Surveys have been made and the funds are ready for the construction of this railroad.

Such a railroad and such a port will still further enable the cotton-growers on the 800,000 acres of Lower California lands to systematize the distribution and marketing of their cotton in a manner similar to that which has saved the orange-growing industry of California from the so-called "red-ink sales" it once endured. That is to say, the cotton from this area can be sent direct to those markets where the demand is the greatest and the price momentarily the highest, instead of dumping it on the market, at any price obtainable, as the cotton-raisers of the southern states have been doing for half a century.

The Colorado River Land Company sells the cotton direct for the leaseholders, and it is proof of the value of organization that the prices paid for this cotton are always *two to four cents higher* than the current New York market prices, f. o. b. Calexico. Unlike the small cotton farmer in other parts of the cotton belts of the world, whether they be in America, Egypt, India, China, or any other section, the small producer in Lower California is taught, first of all, to husband his resources from year to year, to proportion his expenditures to his production, to produce more and better cotton every year, and to handle the business of farming on the same basis that the captain of industry or the large commercial operator handles his greater capital.

Another interesting feature of this industrial empire is the experimental work being carried on constantly with other crops, to find just what cereals, forage plants, vegetables and fruits will produce best in this climate and soil. This year a considerable area is being planted in sugar cane, as the result of some of these experiments, and, if the sugar cane proves a profitable crop, it, too, will be organized and systematized in both production and distribution. Thus more men will be taught to produce, to earn for themselves, under the supervision of those who know how to produce and to sell. There is space and opportunity on these 800,000 acres for 50,000 men at work producing prosperity for themselves and for their state, and the government of the state is assisting the Americans in every way to bring together men and crops, to the end that not only an industry, but a state as well, may be stabilized.

Who Have More Brains, Men or Women?

It's a Question That's Never Been Settled, Nor Will This Do It

By KINGSLEY GRAY

ALL boys call girls silly, and all girls think boys stupid. That is the terse judgment passed by one sex on the mentality of the other. To raise the question, Who are more intelligent, men or women? is to lay oneself open to the charge of stirring up the embers of a smouldering fire, or, at the least, of cracking a hoary chestnut. Until the last decade, which has produced intelligence tests, the question involving the mental fate of half the population has generally been discussed in a most unscientific way.

The earliest codes of laws, those unearthed in the mounds of ancient Babylonia, the cradle of the race, agree with the codes and customs of later centuries in considering women as on a lower plane than men. In fact they are rarely mentioned in the annals of the ancients except in an incidental way. A woman's education consisted in household economics and child training. The wise man Solomon described the ideal wife as one who "seeketh wool and flax, and worketh willingly with her hands," as one who "riseth also while it is yet night, and giveth meat to her household," and as one whose "candle goeth not out by night." "Her husband," continued the sage, "is known in the gates, when he sitteth among the elders of the land." Woman was to work diligently, unrelentingly, by night and by day, happy in the assurance that by so doing her husband, as he stroked his patriarchal beard, would be considered a notable public man, and be accorded a seat with the elders, the city fathers, in the legislative chamber of the city—the gate. *Proverbs 31.*

A girl baby started out in life under a handicap, if not a curse. Women prayed for sons, but not for daughters, at least if they did the fact has not been recorded. The immortal poem of Suhrab and Rustam reaches its climax when the mighty Rustam discovers that his child is not a frail girl but the stalwart Suhrab. The Pharisees, a powerful Israelite sect of the first century, taught young men to pray: "Blessed art Thou, O Lord, our God, King of the Universe, who hath not made me a woman." But the woman must humbly say: "Blessed art Thou, O Lord, our God, King of the Universe, who hath made me according to His will." *"Daily Prayer Book," (b).* Quoted by F. C. Gilbert in *"Practical Lessons for the Church of Today,"* p. 146. With few exceptions, the ancient valuation placed upon women may be expressed in the somewhat paradoxical Mohammedan dictum: "Woman is a necessary evil."

With such a state of affairs existing, it may not be wholly profitless to discuss seriously the question of the relative intelligence of men and women. Are they on the same plane, or is one higher than the other? And if so, which one? Would a man on trial, confronted with a jury of women, have just cause to protest that his sacred right to be tried by a jury of his peers had not been accorded him? With women exercising equal power in the molding of the nation's policies, must we not ultimately retrograde if their intelligence be inferior, and progress if it be superior? for the inherent intelligence of its citizens is unquestionably the measure of a nation's advancement. Out of the first question, all these grow, and they are no idle queries.

By a strange coincidence, this "age of women" has given to us the scientific answer to these perplexing questions. It has long been observed that the reasoning powers of women are different from those of men. The laborious process of adding minor to major premise, and proceeding thus to a logical conclusion, is cut short by women's intuitive grasp of the answer. And to the distress and confusion of masculinity, the conclusion is more often correct than not. Men cannot free themselves from the lockstep of logical sequence of thought; women have either never been thus hindered, or have in the dim past broken the step. For the proverb, "Do not argue with a woman," is very ancient, and is as true as ancient. It originated in the inherent difference of reasoning faculties, though unfortunately it has become tainted with irony and sarcasm as it has passed through the centuries.

It has also long been observed that the emotional qualities are more highly developed in women. The relation of women to religion and love furnishes the best illustration. Women *love*, men *like*. Literature has immortalized this quality in women. The official government statistics of religious bodies in the United States show a considerably higher percentage of women communicants than men. Especially is this true of the newer and more extreme sects.

However, these various observations do not give us the answer to the question we have raised. They only tantalize us. It is in the reports of the intelligence tests, which have been given in schools and colleges during the past few years, that we shall find, if not the answer, then at least material for reflection.

Thousands of girls and boys in the grammar grades have been tested. When the averages for both have been drawn off, the differences have been found so small as to be negligible, though it is an interesting fact that Professor Terman, using the revised Binet scale on a thousand children found that the girls, up to the age of 14, actually averaged one or two points higher than the boys. However, he does not consider this difference large enough to be of any importance. Perhaps the woman phrenologist in England, who maintains that up to a certain age a girl's head grows faster than a boy's, may find in these minor differences an argument for her theory.

In high schools, colleges and universities where the various intelligence tests have been given, the totals and comparative averages obtained have proved, as the lawyers say, beyond all reasonable doubt, that men and women have the same amount of gray matter, or more correctly, intelligence.

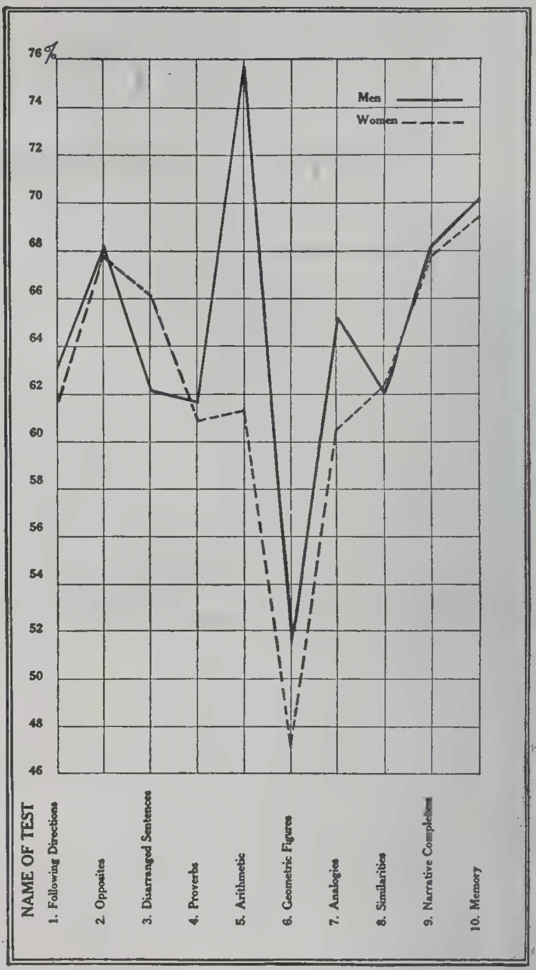
The accompanying graph shows the results of one such test, which the writer took part in giving to 132 young men and 100 young women in a private boarding school. As the young people represented city and country homes in widely separated parts of several states, they made an ideal group for testing. The perfected "Otis Group Intelligence Scale" (Form A), which consisted of 230 tests divided into ten sections, was used. As might be inferred, this test is quite similar to the one given in the army, and is perhaps one of the most widely used of general intelligence tests.

As shown in the drawing, section one tested a person's ability for "Following Directions." It consisted of twenty problems, or tests, such as: "Write the letter which follows the letter which comes next after B in the alphabet." The graph shows that the men (represented by the unbroken line) answered correctly a little better than sixty-three per cent of these twenty tests, exceeding the women by a mere one per cent. So small a difference as this does not lend support to the semi-serious remark of one young chap, who informed me that "this test explained why men make better soldiers than women—they follow directions better."

Section two consisted of twenty-five tests in "Opposites" in words. For example, the word "up" was followed in parentheses by the words, "short, down, small, low, young." Of course, the opposite of "up" is "down." If this word "down" was underlined, the test was answered correctly. Our graph shows that both the men and the women found it much easier to pick out opposites than to follow directions. They both averaged around sixty-eight per cent, with the men a fraction of a per cent in the lead.

Section five, with its twenty simple "Arithmetic" problems, gave the most interesting comparisons of the whole test. Though the problems were, in the main, extremely simple—for example, "If two pencils cost five cents, how many pencils can be bought for fifty cents?" —yet the women seemed to have difficulty with them. However, the men made short work of these tests. In this section is revealed a real difference between the sexes. Evidently there is some truth in the saying that women do not "shine" in mathematics.

Section six, with its "Geometric Figures," proved difficult to all, though more to the women than to the men. It consisted of twenty questions regarding two combination drawings of rectangles, circles and a triangle.



A graph showing the comparative averages obtained by 132 young men and 100 young women who were given the "Otis Group Intelligence Scale" test. The test was given at Pacific Union College, California, in October, 1919. The ages of the young people ranged from about 14 to 27. The group was composed of those both in the high school and college grades. (For the sake of economy of space, the per cent column goes no lower than 46% nor higher than 76%.)

The whole test revealed other sex differences not indicated on this graph. When the individual grades were examined, it was found that a man had made the highest score—and the lowest. The range between these two men is the difference between 49 and 213. The lowest man was only forty-eight points from zero, while the highest was only seventeen points from perfect. The range of scores for the women was between 69 and 199. There were more men who scored perfect in different sections of the test—and more, zero—than the women. Still further figures and data might be cited to show that the men departed from the general average much more than the women. Summing up the results it should be said that for the whole test the men averaged but two per cent higher than the women. In other words, the men answered correctly 149 of the 230 problems, and the women, 145. It might be added that a person who answers correctly 130 is of average intelligence.

At the University of California a "general intelligence test and a test on high school subject matter information," was given to 1,182 freshmen. The published report makes this comment as to sex differences revealed by this somewhat lengthy test: "The women made grades slightly lower than those attained by the men. This difference, however, was not marked." It also adds that "the range of distribution of the men is wider than that of the women." That is, men went higher—and also lower—than women. These findings tally with those of the Otis Test, and are a fair sample of the sex differences found by this modern and scientific method of measuring intelligence. The ancient belief that women are mentally inferior to men—until the present time taken for granted—must now be rejected as false.

The Old Manse Bespeaks Spirit of Concord

Concluded from page 3

the first real line and dispatched the first message sent over wires by electricity. He proposed to erect a line between New York and Philadelphia, but when the legislature of New Jersey denounced him as a man dangerous to the community, he fled in disgust to Europe.

Concord has a surprisingly large number of cemeteries. The oldest is Hillside, in the center of the town. Here lie the heroes of Revolutionary fame, and probably Peter Bulkeley, founder of the town and direct ancestor of William and Ralph Waldo Emerson. To him belongs the honor of writing the first book of the Colony, a collection of sermons called *New England's First Born.* In this same Burying Ground is the grave of John Jack, said to be the first slave brought to America. Obscure as was his life, his epitaph is the most famous in the country. It reads in part:

> "Tho' he lived in a land of liberty
> He lived a slave
> Till by his honest, tho' stolen, labors
> He acquired the source of slavery,
> Which gave him his freedom;
> Tho' not long before
> Death, the great tyrant,
> Gave him final emancipation
> And set him on a footing with kings."

Sleepy Hollow Cemetery is sometimes called the Westminster Abbey of America, but it is hard to imagine a greater contrast than between that stately pile and the simplicity of the village graveyard. There are no markers to direct the visitor, no sepulcher to attract the eye. Under the pines on the hillside they lie, neighbors, as in life, the great Concord brotherhood. The grave of our greatest genius is marked by a low stone with the single word "Hawthorne" engraved upon it. Just below are the graves of the Thoreau and the Alcott family with the simplest of memorials. A boulder of rose quartz marks the grave of Emerson, with two lines from his poem, *The Problem*:

> "The passive master lent his hand
> To the great soul that o'er him planned."

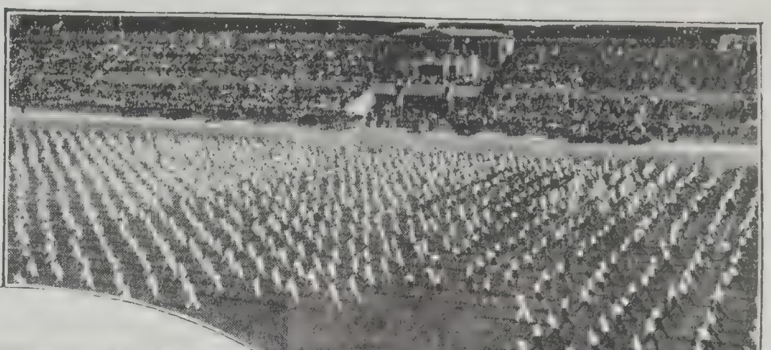
In Concord much of the past remains to inspire us. The Emerson House is still occupied by the Emerson family. Mrs. Lathrop, better known as Margaret Sydney, a connection of the Hawthornes, still owns Wayside. The Old Manse is the property of the Ripley family who live there summers. And the peaceful village, built about its Green with church of beautiful colonial architecture, still attracts cultured men and women. The Concord Art Club, with Daniel Chester French as its president, has members and exhibits from among the leading artists all over the country. Allen French, author of boys' books, and Samuel Merwin, novelist and magazine writer, make their homes there. Although its halcyon days may be over, no other spot can kindle so hopeful or so wonderful a vision with which to face the new.

The European Finds He, Too, Has Muscles

Germans Learning From America What It Means to Be Athletic

By

WALTER M. WOLFF



A mass calisthenics exercise of 4,000 turners in the big "Stadion," near Berlin. (German Olympic Games, 1922.)

German women athletes who are strong for a freer, happier, sturdier race.

Feminine sprinters of all ages out for a double-quick stroll around the "Stadion" track.

THE original sport-lover, athlete, and physical culturist does not hail from European soil. He is found once and only in the United States of America. But the coming athlete, the man of sinewy muscles packed chock-full of agility, is to be found sprouting forth at remarkably frequent intervals among the usual type of underfed, underdeveloped sons of Central Europe. The human bean pole, forty pounds underweight, with curvature of the spine and flat feet, or the man whose physical condition is so low that he cannot lift his own weight, is rapidly and rudely being crowded to the wall by the individual who hikes, plays rugby, swims well, runs the hundred meters, heaves the weight; in fact, who does about everything athletic that the American boy is wont to do.

In Germany, outdoor sports are becoming so popular, judged, of course, by European standards and point of view, that the Germans ought to figure very prominently in all the international contests of the future. Contact with the doughboys on the western front did much to give the Germans a savory taste for Yankee athletics. During the American occupation at Coblenz, the Heinies got their first real eyeful of American baseball and football. American boxers and fist-artists constantly come and go, but stay long enough to enable the Germans to see them in action and to copy their methods. Then the thousands of American visitors to the Fatherland each year bring with them much of the spirit of American sport and athletics, and the German is eager to learn. He knows the American leads the field when it comes to physical fitness, athletic ability, and all-around aggressiveness. And having clearly recognized these facts he feels he must be on the right track. The results of his efforts in a physical way show him to be making great strides; and when a man once more grows interested in his body and its physical development and welfare, even such great scourges to human progress as the late war can at last be successfully overcome and the effects obliterated.

The Germans do not yet know what a Y. M. C. A. is like, nor are they as universally athletic as America, but their desire to be active is spreading over the country to such an extent that public gymnasiums, golf links, tennis courts, playgrounds, swimming pools, and the like, should not be far distant. The present crop of Teuton athletes have among their number some very able specialists—men who are skillfully trained and who intend placing Germany in front rank at the Olympic Games. And we must not forget the women. Many thousands of the gentle sex train as regularly as do the men, laying the foundation for the healthy, athletic Germany of tomorrow. In the big "Stadion," or stadium, near Berlin, Germany's young and old are learning to become bigger and better men and women, stronger and healthier boys and girls—physically. Here every modern convenience lies at their disposal and trained instructors give all their time and effort to the task of placing Germany at last very markedly on the athletic map of the world. The great stadium is the university, the recruiting station, and the popular gymnasium for the physical education of new republican Germany.

With all this intensification and development of the physical welfare of her people, Germany is, as has been said before, casting an anxious eye toward Paris for 1924. She feels she must show the world that, although vanquished on the battlefield, she is still a reckoning factor—now stronger than ever before—on the field and track of sportdom. During the past two decades the United States has carried off the greater part of all the glory at the Olympic Games, the Finns, Swedes, and Britons trailing along behind, usually too far down the line to make it interesting. In the days prior to the war, Germany used to figure somewhere in the running. Such men as Hans Braun, the fleet-footed sprinter, placed Germany well up in front in 1912. Then the Olympic Games ended abruptly as far as Germany was concerned. In 1916 everybody was so busy winning the war, the games could not be held. In 1920, at Antwerp, the Germans were not allowed to enter. And there is still some doubt whether the Germans will be permitted to come to Paris in 1924. Recently a Hungarian football team visited Paris and one of its members tried to sound out the possibilities of Germany taking part in the games next year. An authority on the subject is said to have stated positively that Austria and Hungary would be invited to the games but that owing to minor difficulties the official German participation had not yet been fully decided upon. He concluded with the remark that Germany doubtless had full right to be admitted to the games and that she would receive an invitation in the due course of time.

In this connection it is interesting to touch upon the great Olympic Games of 1924 to be held in France from early January until the close of July. While the track and field events and many of the other athletic contests will be held at the Colombes Stadium, near Paris, other competitions will take place in parts of France as widely separated as the Alps and the Channel. The Games will open January 20, with winter sports, the site being either in the Alps or the Pyrennes. The yachting events which wind up the program will take place in the Channel, probably off Havre. The events include almost every form of sport and exercise.

In spite of the vigorous efforts being made in preparation for the coming international contests on the part of our Anglo-Saxon friends across the sea, it is hardly to be expected that Europe will triumph over America at an early date. However, Uncle Sam's boys will have to watch their stride with exceeding care. Some day Europe may wake up to the realization of her ability, and then the Olympic Games should turn out to be actual battles from start to finish.

What Happened to the German U-Boats

ONE fine day in the latter part of October, 1918, a wireless message was sent to all the German submarines that for them the war was already over. For some four years many people the world over have been wondering what really happened to Germany's big fleet of U-boats; that is, to those which saw service and were not turned over to the Entente en bloc under the terms of the peace treaty. After more than four years at work compiling the history of each boat, the Germans have finally completed a summary which tells the entire story.

Most of us will recall the thrilling trip made across the Atlantic in 1915 by the merchant-submarine *Deutschland* which eluded the English cruisers on guard just off our coast and brought over a million dollars' worth of chemicals, mail, and other articles, slipping out again with ten million dollars' worth of exports. A sister ship, the *Bremen,* is said to have been lost at sea with an even greater cargo of imports. Then we remember the accounts of the sinking of the English cruisers, *Hogue, Cressy,* and *Aboukir,* in the Channel, and we come to the conclusion that after all it must have been pretty easy for the German U-boat to shoot off a torpedo, dive down under again and disappear, leaving her victim to settle and "drown by inches." But the fact has been established that the art of "submarining" is about the most hazardous of all enterprises.

On August 1, 1914, twenty-six German submarines were ready for action at the word of Von Tirpitz. During the first year and up to July 31, 1915, nineteen more boats had been completed. But during this same period *eighteen submarines were lost,* and Germany worked at top speed to build sixty-five more by the end of July, 1916. In the third year of the war one hundred and one "subs" were completed, and in the fourth year ninety-nine. By November, 1918, Germany had finished a further sixty-one boats, making in all a grand total of *three hundred and forty-five* U-boats built during the war.

The building of the submarines which at the beginning of the war was done by several small shipbuilding concerns, was soon after turned over to the six largest companies. Most of the boats were constructed by the Vulcan Werft at Hamburg which built eighty-nine U-boats and had thirty-seven in the course of construction at the time of the armistice. Second in importance was the Germania Werft at Kiel which delivered seventy-nine boats and was working on twenty-eight more at the close of hostilities. The firm of Blohm & Voss, Hamburg, had completed sixty-seven and had begun work on thirty-nine more, and the old Imperial Werft at Danzig manufactured thirty-two boats and had begun work on thirty-two others. Finally, the Bremer Vulcan in Vegesack built four submarines and had twenty more in the process of construction, and forty-one boats were started on at the time the "Hindenburg Program" was passed, but these ships could not be finished before the end of the war.

Perhaps the most interesting figure of all is the number of U-boats lost during the war—199 altogether. This amount does not include 172 boats which were turned over to the enemy, and those which were destroyed by the Germans themselves, or which were interned and later sold to neutral countries. Of the boats interned and later sold were five to Spain and two to Holland. The Germans destroyed fourteen submarines themselves owing to defectiveness; seven of these in Pola, four in Flanders, one in Cattaro, one in Fiume, and one in Trieste.

It is also interesting to note that the German submarines were lost in sixteen different ways. The majority of them, that is, thirty-seven, were lost through water bombs. Another thirty-six boats fell victims to mines, while twenty more were lost through fights with enemy submarines. Engine trouble and other difficulties caused the loss of fourteen U-boats. Thirteen were sunk by torpedo boats and destroyers, and twelve by submarine chasers. Nine submarines were reported missing and eight were lost through ramming into other ships of various kinds. Six boats were sunk by armed fishing vessels, six by bombs from airplanes, and six found their graves in the nets of the English Channel and in the harbors of the enemy. Three German submarines were sunk by regular patrolling vessels, three by armed auxiliary cruisers, two by cruisers and two by artillery fire from the coast. One boat was sunk by a liner—Captain Weddigen's "U-29."

The list showing the localities at which German submarines were sunk is very complete. Fifty-six boats were lost in the English Channel, twenty-six in the North Sea, sixteen in the Mediterranean, sixteen around the east coast of England, twelve off the Dutch coast, nine off the coast of Ireland, seven in the Irish Sea, five off the western coast of England, three near Heligoland, three off the Scotch coast in the North Sea, three in the Black Sea, two off the coast of Flanders, two off the French coast in the North Sea, two in Scapa Flow, two near the Shetland Islands, two near the Scilly Islands, two in the White Sea, one in the North Sea, one off the Danish coast, one at Horns Riff, one in the Atlantic, one in the Bosporus, and one shortly west of Gibraltar.

This appalling record of German U-boat losses would not be complete without adding the figures of the losses in human life. A total of 5,364 German sailors lost their lives as a result of the submarine campaigns. Among this total were 515 officers, 368 of them being sea officers, 144 engineers, two doctors, and one a torpedo lieutenant. Of the naval officers, 296 were in active service and seventy-two belonged to the naval reserves. Of the engineers, 130 were active, and fourteen reserves.

Teaching in Terms of Children

Reconstruction of High School Courses Undertaken to Get Away From Set Routine of Study

By HENRIETTE BOECKMANN

DR. FRANKLIN BOBBITT

RECONSTRUCTION of the courses of study in high schools that they may develop our boys and girls to the fullest, instead of placing before them so much history and so much English, and saying, "There! You take that," is now being undertaken by Los Angeles.

One thousand, two hundred teachers have the opportunity to express their opinions upon what objectives they would have students concentrate their energies.

The following are salient points brought out in the Los Angeles high school curriculum revision:

Two things are to be considered. First, is it a human necessity? Second, is it so complex or inaccessible as to require systematic teaching?

Subject obsession is one of the things to be eliminated; in vocational training this is being rapidly done.

Los Angeles has recovered from the feeling that Latin and Greek are necessary. As regards the solving of geometry problems, there is gained a certain discipline from doing a useless thing, but that same discipline might have been obtained in doing a useful thing.

The fundamental business of modern education is to develop great souls.

Teachers do most of their thinking in school subjects instead of thinking in terms of producing human abilities.

The present program of public education was worked out for the most part, during the simpler conditions of the nineteenth century. Formerly education consisted chiefly of memorizing facts.

Dr. Franklin Bobbitt is author of the first book on curriculum-making; for 13 years he has been professor of educational administration in the University of Chicago. This quiet teacher, with his quizzical smile and hair bleached white by Manila suns, is gathering all that is valuable in present educational courses, and casting aside all that is considered waste.

Booklet Tells of Aims

IN THIS sifting process, the viewpoint of the layman as well as that of the profession has been sought. Toward this end Dr. Bobbitt has issued a pamphlet entitled Educational Objectives, and addressed it to the Citizens, School Officials and Teachers of Los Angeles. In this pamphlet the human characteristics and abilities to the number of approximately 500 are classified in 10 groups as follows: Social Intercommunication; Physical Efficiency; Unspecialized Practical Labors with subhead of Tools, Materials, Processes, and so on; House, Equipment, Management; Electrical Appliances; Fire Protection; The Premises, including the garden, and so on; Animals, that is, pets, livestock, and so on; Travel and Outdoor Life; Clothing; Cooking, and so on; Cleaning, Laundry, and so on; Sanitation; Fine Arts; Care of Person; Financial, Commercial, and so on; Occupational Objectives; Efficient Citizenship; General Social Contacts and Relationships; Leisure Occupations; General Mental Efficiency; Religious Attitudes and Activities; Parental Responsibilities. The booklet is a comprehensive list of personal and social achievements, for education is needed, either in schools or through life's activities. Throughout there is the implied conviction that the main fact to be kept in mind is not the subject matter of the studies, but the human characteristics and abilities, the ideals and habits to be developed.

The pamphlet states that the lists set down are but working groups to be amended and improved, that when in acceptable form they will show the goals to be aimed at in formulating the public school curriculum.

"I want," said Dr. Bobbitt, "to get the attention of the practical man. The practical man is, I have found, a good deal of an idealist if the thing is practically put.

"The isolation between the community and the schools has not been the fault of the public alone. The schools have worked more or less apart and consequently have not served as they should. Lack of support in buildings and other material necessities has also contributed to the estrangement.

Los Angeles Given Opportunity

"THOSE who, by years of training and study, are best fitted to compile courses of study should be allowed the final decision, but I do think that the schools should utilize the judgment of both teachers and public in curriculum-making. First we should avail ourselves of the experience of the teachers.

Newspapers, declared this curriculum captain, could be of great help in bringing about a better understanding between the schools and the public. "We of the teaching profession," he said, "must talk so the public can understand. Then we can gain a hearing."

It is understood in the instituting of this projected survey of Los Angeles high schools, that the subjects of lessons may differ with different individuals and different environments. It also becomes clear that the objectives aimed at in any school system must differ in the various parts of the country according to the particular needs of the people And the training should be as wide as life itself, giving due attention to human activities of every type.

The interest evinced by Dr. Bobbitt in certain work recently accomplished by the Los Angeles schools, when he wrote of the same in educational periodicals, and the capacity for curriculum-making displayed in his book by that name, were instrumental in this Educational Engineer being invited to come to Los Angeles to work out in detail his theory which, while it has heretofore been applied to one or two subjects in several cities, has never before been applied to an entire school curriculum.

School surveys consist of an examination within a city school system, a checking up, as it were, of the city's educational system and the supplying of advice as to what might be done. From his university classes where men and women receive training for administrative supervisory work, Dr. Bobbitt has drawn the ideas for the pamphlet which has been distributed among all the high school teachers. Upon one teacher remarking that the seeking out of the most legitimate educational objectives was the human way, Dr. Bobbitt added that it was also the scientific way. As an illustration of the work already accomplished by Dr. Bobbitt, another teacher admitted that this curriculum chief made her think of education in terms of children instead of in terms of subjects.

From each school a teacher for each subject is appointed to compose the committee of 25 which enters into consultation with Dr. Bobbitt. These teachers of the committees may also hold meetings with teachers of their subjects in their respective schools.

"I am not doing the work for them; I would not do that," assured Dr. Bobbitt. "I can only suggest. It is for them finally to decide what particular abilities they would like to see developed in the pupils of their particular subjects, and these must be stated in human terms. My principal work is to focus the attention of the different departments on human abilities."

It was agreed that this pamphlet on Educational Objectives would require a stimulating siege of thinking on the part of those teachers who have jogged along "as is," to make use of that expression attached to tables in department stores where merchandise is accepted exactly as it is, no matter how full of flaws it may be. "It is so easy to go along in a rut—so much easier than to get out of one," added Dr. Bobbitt.

On the whole the 1,200 teachers included in this educational examination have been prompt to submit their opinions. Returns so far indicate that the Los Angeles teachers approve everything in the pamphlet, with about 50 additional suggestions.

Once getting a certain plan of work under way, Dr. Bobbitt will allow it to continue under the direction of the Los Angeles High School Department of Psychology and Research. From his headquarters in Chicago, however, this curriculum specialist will keep a watchful eye on the development of his plan, as undoubtedly will be the case with school authorities, all over the country, vitally interested in seeing the outcome of a great modernizing educational theory put into practice.

Has Written Books

IN HIS little book, called, "What Schools Teach and Might Teach," Dr. Bobbitt says, "Both school people and community should remember that since schools are to fit people for social conditions, and since these conditions are continually changing, the work of the schools must correspondingly change. Social growth is never complete; it is especially rapid in our generation. The work of education in preparing for these ever-new conditions can likewise never be completed, crystallized, perfected. It must grow as fast as social conditions make such changes necessary. To point out such further growth-needs is not criticism. The intention is to present the disinterested, detached view of the outsider who, although he knows definitely less than those within the system about the details of the work, can often get the best perspective rather better just because his mind is not filled with the details."

No bigger problem exists in school systems, than that of knowing how to train boys and girls to become efficient citizens. In training a boy to become a plumber, for instance, his necessary abilities are evident. Suppose there are 165 different things which constitute a good plumber. These then become the boy's objectives and must be mastered before he will be a good plumber. But we are not all agreed as to what citizens ought to be doing. Some think the sum and substance of a citizen's functions are casting his vote at the polls, paying his taxes, and reading the morning newspaper. Another will have quite a different idea.

To quote from the fifth division in Educational Objectives: "Except as we know what a citizen should do we cannot know for what practical duties and abilities to train him. In spite of the uncertainty of our general civic thinking, doubtless the good citizen should possess the ability to do his individual share in performing those social functions for which all citizens are equally responsible in the support and oversight, in the interests of the general welfare of each civic service agency."

Twelve Most Desirable Objectives

THE interesting presentation of the 12 most desirable objectives as given in the pamphlet are herewith tabulated:

Ability and disposition *to participate* in a large number of unspecialized practical activities as enjoyable and fruitful spare-time occupations.

Ability, disposition, and habit of diversified *observation* of men and things and affairs as an enjoyable and fruitful leisure occupation.

Ability, disposition, and habit of abundant and greatly diversified *reading* as a means of enjoyable and fruitful indirect observation of men, things and affairs.

Ability to utilize *pictures* as a means of enjoyable and fruitful indirect observation of human affairs.

Ability wisely to utilize the *drama,* silent and spoken, as a means of enjoyable and fruitful indirect observation of human character, action, and affairs.

Ability to utilize *conversation* as a profitable and enjoyable means of participating socially in the thought of the world.

Ability and disposition to enter into more formal discussion in clubs, civic organizations, and so on.

Ability to participate in public discussion of current social problems as a leisure occupation.

Ability wisely to utilize the participative and observational opportunities of *travel* as leisure occupations of maximum pleasure and profit.

Ability to utilize *music* for healthful, abundant and varied awakening of one's emotional nature.

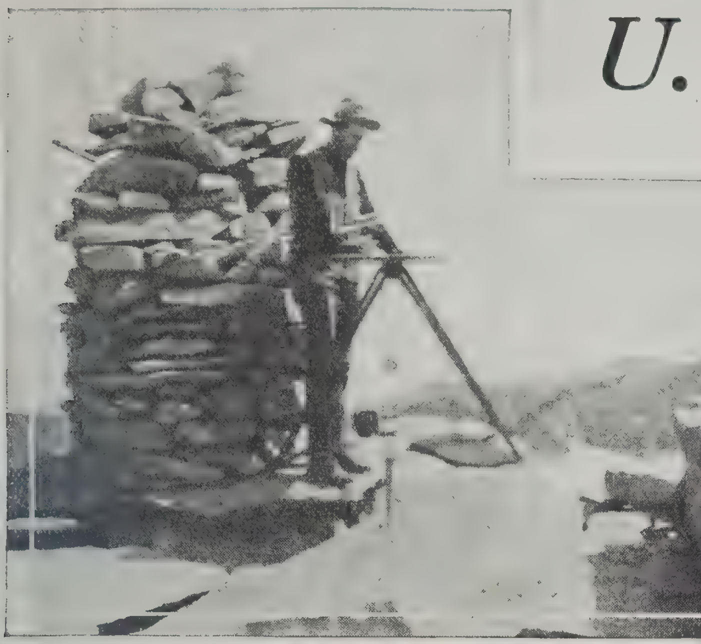
Ability and disposition to utilize *lectures* as means of widening one's thought by entering into the thought of others.

Ability, disposition, and habit of taking up occasionally the *systematic study* of some new thing in which one is interested.

Dr. Bobbitt climbed the ladder from a village school. Indiana University graduated this authority who, a Hoosier, is of New England ancestry. Following his matriculation, he taught four years in the Normal School in Manila when Dr. David T. Barrows, president of the University of California, was director of education for the entire archipelago.

"I consider my experience in Manila very valuable," Dr. Bobbitt informed me. "We had to select a form of education adapted to the particular needs of that island people. It was there, in fact, that I first became interested in curriculum-making, and I feel that some of the best training I am doing came out of that effort."

Topographers Freeze and Swelter to Cover U. S. for $100,000,000 Map



"The top of the United States." The topographic engineer, George R. Davis, added a few feet to the height of Mount Whitney. It is more than fourteen thousand feet above the sea.

By S. R. WINTERS

YUMA, ARIZONA, "the hottest town in the United States," where the pointer on the thermometer scale hovers around 130 degrees Fahrenheit, and Alaska, where the temperature in summer registers 45 or 50 degrees below zero, are not dodged by map-makers of Uncle Sam because of their extremes of heat and cold. Nor do altitudes foil the Geological Survey of the United States Department of Interior on its surveying expeditions. For instance, Mount Whitney, 14.501 feet above mean sea level, and Death Valley, 276 feet below sea level—both points in California, and only about 90 miles apart—are faithfully represented in the topographic figure of this country. Similarly, Mount McKinley, Alaska, 20,300 feet above sea level, is included in the superficial features of the Continental United States.

When early surveys of Alaska were being made, a representative of the Geological Survey established his base camp at an elevation equal to the height of Mount Whitney, 14,501 feet above sea level. The conditions under which maps are made in Alaska are more aggravating than in the States—both altitude and temperature environments being extremely trying on the surveyor. There are a number of peaks in Alaska several thousand feet higher than Mount Whitney. The temperature conditions under which map-makers labor are, indeed, variable—ranging from 45 degrees below to 100 degrees above zero. Philip Smith, acting director of the Geological Survey of the United States Department of Interior, recently returned from Alaska, where he found the temperature 17 degrees above zero during the summer of 1922.

The biggest and costliest map in the world—involving an expenditure in excess of $100,000,000 and requiring 52 years to execute—is in the making. The huge production, giving a detailed description of the features of the Continental United States, will represent the workmanship of the Geological Survey. Forty-three per cent of this topographic figure of America has been completed and with the elapse of another twenty years the word *finis* can be agreeably written. A bill pending in Congress, if enacted into law, appropriates $37,200,000, distributed over an even score of years, for the completion of the undertaking, begun in 1889. An additional $12,000,000 is in prospect as the total allotment from various states. Thus half of this map of the United States will cost $49,200,000.

Topography—or in the parlance of the street, "lay of the land"—is a word of Greek derivation, *topos,* meaning a place, and *graphein,* to describe. Therefore, this gigantic engineering project—probably unequaled in fineness of detail and magnitude of area—will be a detailed description of the millions upon millions of places comprising our vast country. Remote and frequented points—in fact, every nook and corner of the United States—will be explored by the surveying crew of the Geological Survey in its undertaking of denoting the diverse physical surfaces of the country and faithfully transmitting them to paper. The "top of the United States," Mount Whitney, California, as well as the marshy lowlands of the Mississippi delta, is painstakingly recognized by the instrument of the surveyor. Strangely enough, a topographic map is covered with contour lines, and the latter are level lines of elevation. Moreover, a representation of topography is a relief map. The shapes and elevations of land and water features are described, and such objects as railroads, highways, and buildings are presented with respect to their true relation to one another and to the land and water features.

This one-hundred-million-dollar topographic map, when completed, will be 3,000 inches wide. Obviously, it is not a vest-pocket edition, and, in the interest of convenient carriage in one's pocket, the map is being published piecemeal. When a section of the country has been surveyed, the corresponding sheet is printed in a form described as a "quadrangle." Approximately 3,000 units have been published and the maps issued. The surveying and engraving of a map of a standard quadrangle—embracing 225 square miles—entails an investment ranging from $3,000 to $8,000, depending upon the nature of the country whose physical surface is being determined. The Geological Survey distributes these sectional topographic figures at ten cents a copy, a price barely exceeding the cost of paper, printing, and distributing. Only Uncle Sam can afford these liberal offers, as a commercial concern producing such maps would be forced to retail them at $5 each.

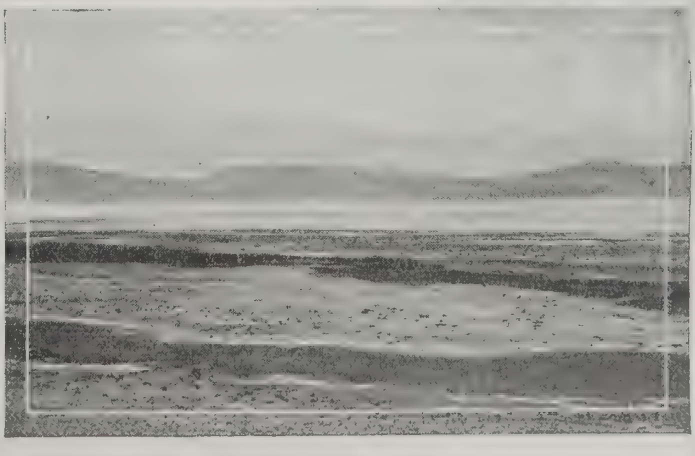
A difficult table station of the Geological Survey in the Sacramento Valley.

Persons who may hold the idea that maps are imaginary productions or guesswork at best need only to study the operations of a topographic engineer to have this notion dispelled. The map is made on the liberal scale of one mile to one inch, a ratio enabling the topographer to comply with the requirements of the word topography—*topos,* a place, and *graphein,* to describe. The conventional map of the United States, to be seen on walls, is seven feet wide, having been constructed on the scale of forty miles of land surface to one inch of map surface. Thus, in the production of the world's largest map, there is generous allowance for the inclusion of most of the ground objects when the scale is one mile to one inch. Like the nature painter, the topographic engineer assembles his material for map-making by immediate contact with the objects being portrayed. "Scrupulous accuracy" are words to be conjured with as he takes the trail through dense woodlands or ascends to sky-climbing altitudes. The human eye, focused through an unerring instrument, makes possible an accurate portrayal of the shapes of slopes, hills, and mountains. Moreover, the finished map is a lexicon of altitudes for every named and unnamed point.

From field operations, a season terminated by a blanket of snow and other unfavorable weather conditions of winter, the topographic engineer returns to the Washington office where his observations are translated into durable and serviceable form. Pencil marks and lines made in the field are traced over with India ink. He thus lives anew the experiences encountered while negotiating the surveying instrument, perhaps joyfully recalling the pleasant incidents and forgetting the hardships encountered. An engineer can survey and place on paper a square mile in one day but months may be required for the engraver to complete the finished product. Meanwhile, the topographic engineer is rightfully jealous of his map-in-the-making. Like the old-fashioned school of printers who slept on rolls of paper with the bed of the press as a "downy" cushion, the topographic engineer literally has his precious sheet, descriptive of the "lay of the land," near him during waking and sleeping hours. Fire, theft, and the carelessness of the other fellow are ever-present evils to the engineer, and "safety first" for the potential map is a motto faithfully observed. When inking the topographic representation, and lunch-time invites a temporary cessation of work, the map-in-the-making is thrust into a fireproof safe

The engraver in the Washington office of the Geological Survey is likewise painstaking in his effort to reproduce truthfully the representations of the topographic engineer. Each line of the original sketching is cut on a copper plate—representing miles and miles of contours, streams, roads, trails, bridges, houses, and other objects coming within the circumspect observation of the surveyor. The engraver can cover more than a square mile, or rather a square inch, a day, as the engineer does, yet a difficult figure of a mountain may involve three months of patient effort to complete. The finest hair-lines and lettering on the restricted space of one inch indicate every important physical, natural and artificial object contained in a square mile of the surface of the earth. And, remember, the topographers literally know, or eventually will, "every inch of the United States." After being inked, and previous to engraving, the map-in-the-making is photographed and copies distributed and deposited in various places. The Geological Survey recently installed for this purpose the largest camera of its kind in the world. Thus its preservation in some form is guaranteed. Having been engraved on copper, the topographic map is printed from stone in three colors by the lithographic machinery of the Geological Survey.

The surveying and mapping of the Chesapeake Bay by Captain John Smith about 300 years ago was probably the first job of its kind in the United States. Interest in the undertaking lagged because of the sparsity of population compared with the abundance of natural resources available. Within recent years, however, the awakening of America to its opportunities of industrial and commercial development has served to emphasize the need for a topographic map embracing the entire area of the United States. The British Isles, France, Belgium, and Germany, have surveyed and mapped all their lands. Switzerland is said to be the best-mapped country in the world. Mexico, China, and the United States are woefully behind the other countries.



Above—A surveying crew of the Geological Survey of the United States Department of Interior climbing the slope of Mount Whitney, California.

At left—Death Valley, California, scarcely more than ninety miles from the "top of the United States," is the lowest point in the United States —276 feet below the level of the sea.

BRIEFLY TOLD

Of the four men "holding down" Wrangell Island in the Arctic for the Canadian Government, three are American citizens. The island is about eighty miles long and thirty-five miles wide, rugged and rocky with a maximum elevation of about 2,000 feet. It is probably the greatest polar bear country in the world and there are no locations better for fox raising. Both the United States and Russia have somewhat shadowy claims on it. In time it no doubt will possess great value as an airplane station in the line of what promises to be the shortest and safest aeronautic route between Asia and America.

The Desert Touring Club of Alexandria, Egypt, has fifteen members, including Albanian, British, French, Greek and Italian. With three cars they tour thousands of miles over the Sahara Desert.

Stately Japanese cedar trees line both sides of the 30-mile boulevard leading from the imperial summer palace at Nikko, Japan, to a near-by village. The trees tower 200 feet or more in the air. The legend has it that several hundred years ago the emperor summoned all the noblemen to his summer palace, each one being requested to bring a gift. An impoverished nobleman carried with him a sack of tree seeds, and planting the seeds on both sides of the highway caused his name to be remembered long after the gold and silver offerings of his colleagues had vanished.

When a new illuminated hand bag is opened a tiny electric bulb is switched on, showing the interior and permitting the owner instantly to locate keys, money, theater or railway tickets, or to use the little mirror.

Erich Ludendorff, one-time quartermaster-general of Germany's armies, won a victory in the Munich Court recently when Dr. Wiener, editor of the official organ of the Central Association of German Citizens of Jewish Faith, was sentenced to pay a fine of 150,000 marks and the costs of the trial, and publish the verdict in his paper. Wiener wrote and published an article based on an alleged interview with Ludendorff in which he was quoted as saying hard things about the republican government of Germany and German-Americans.

A lamp that rivals the light of the sun has been invented by a Swede. Under the light of this lamp colors may be matched as accurately as if they were being viewed in the sunlight. The invention is the result of a series of experiments by a Stockholm company headed by the Nobel prize-winner, Dr. Gustaf Dalen.

Eight hundred thousand ladybugs valued at $5,000 were recently distributed to the orchardists of the Rogue River Valley, Oregon. They are to be used to clear the orchards of scale and aphis.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The Federal Government owns 148 national forests comprising a total of 156,000,000 acres. The use of the national forests is encouraged, provided certain regulations for fire protection are observed.

Of the 1,200 or more species of birds native to the United States and Canada less than one per cent are really injurious.

A new army rifle, the Garand, is a sort of a one-man portable machine gun. It can pump sixty shots a minute, as against the twenty-five a minute of the Springfield, and has nearly twenty-five per cent less recoil than the older type of rifle. It weighs a trifle over a pound more than the old gun and is about four inches longer.

At a novel toy balloon festival held recently at the Dutch fishing town of Volendam, 2,000 air vessels were sent up for long-distance competition. The winning balloon came down two miles from Bremen, Germany.

Gasoline bootleggers are operating on the outskirts of Los Angeles, California. The bootlegger buys casing head gasoline at the oil fields close by for nine and ten cents a gallon. It is then either blended with benzine or kerosene or sold straight. The result is a wild and dangerous fuel, causing the motor to back-fire and overheat.

Trout are dynamited in Alaskan waters in an effort to rid the streams of them as they destroy salmon eggs.

Woodrow Wilson recently wrote, "Capitalists have often seemed to regard the men whom they used as mere instruments of profit, whose physical and mental powers it was legitimate to exploit with as slight cost to themselves as possible, either of money or of sympathy."

Flying scholarships for men and women in the 1,000 largest cities of the country have been offered by the National Aeronautic Association to stimulate interest in aeronautics. One scholarship will be awarded for each 25,000 population of the cities. Candidates must be seventeen years of age or over and must be physically fit to fly. The scholarships call for instruction in flying at the leading flying schools. It is part of the association's plan to put "America first in the air."

Magnus Johnson, Senator-elect, in an interview, is quoted as saying: "The United States Government must obtain the exact cost of production, and the farmer should be paid accordingly, with a plus profit.

The site of the pioneer village of Schoenbrun, the first settlement in the Northwest Territory, near New Philadelphia, Ohio, has been determined by an archeologist. The old village was founded in 1772 by a Moravian missionary. Fragments of brightly colored glass resembling Venetian glass, such as traders gave Indians for skins of animals, fragments of clasp knives used for hunting, large sheets of pure beaten copper, flintlocks used in muskets, tomahawks, wrought iron nails, human bones and potteryware were found in the cellars. The village passed from existence in 1782.

The death house at Sing Sing prison now has its radio set to give the condemned their last contact with the outside world.

Great Britain plans to spend 11,000,000 pounds during the next ten years in constructing a great dockyard and graving docks for large navy craft at Singapore. Viscount Grey in the House of Lords in answer to a question whether the new naval base was aimed at Japan or the United States said, "The only justification for the Singapore naval base is the possibility, however remote, of war with Japan. If such a war did occur, it would be a race conflict, in which the United States and the British Empire would be engaged on the same side."

One hundred pounds of milk testing four per cent butter fat will make a number of different things such as: 4.8 pounds of butter; 11 pounds of cheddar cheese; 45 cans of evaporated milk; 12.5 pounds of whole-milk powder; 23 pounds of Camembert cheese or 8.5 pounds of Swiss cheese. A number of by-products are also available, depending on the use made of the milk.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

8-25-23

THE DEARBORN PUBLISHING CO.

CHRONICLER OF THE NEGLECTED TRUTH

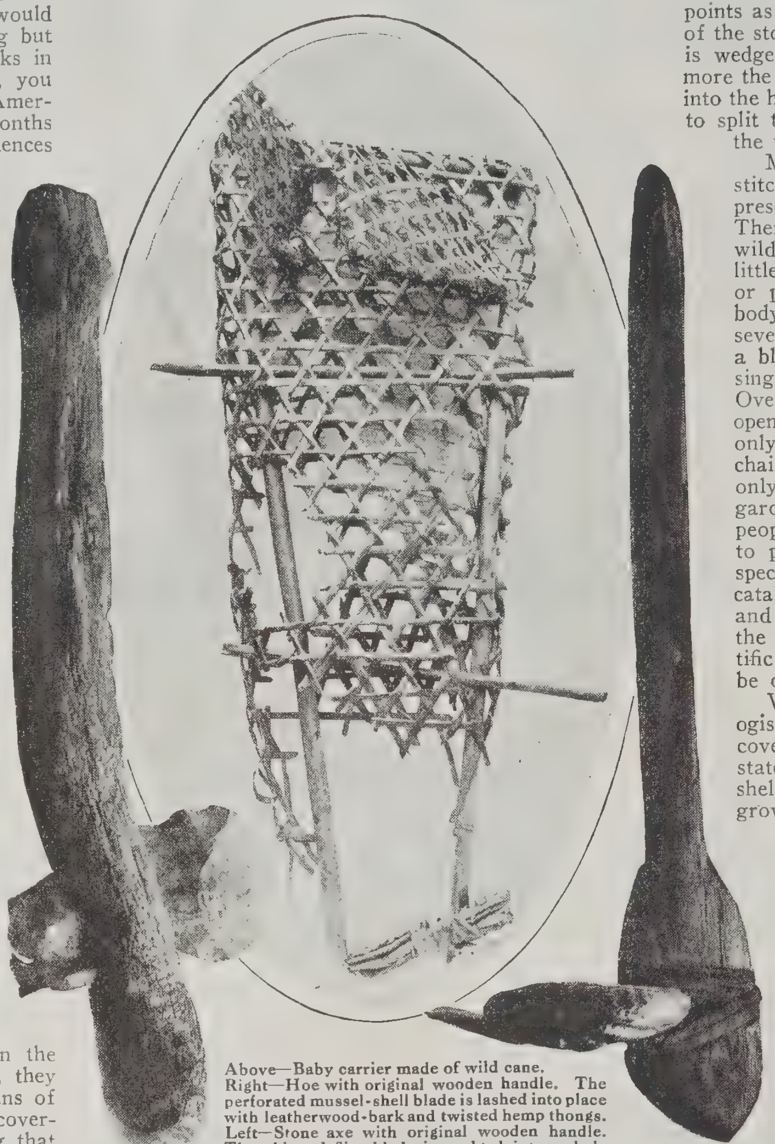
On the Trail of Our "Rock Shelter" People

Archeological Spotlight Diverted From King Tut to Ozarks

By BURT M. McCONNELL



Above—Baby carrier made of wild cane.
Right—Hoe with original wooden handle. The perforated mussel-shell blade is lashed into place with leatherwood-bark and twisted hemp thongs.
Left—Stone axe with original wooden handle. The chipped flint blade is wedged into a hole cut in the haft.

WHO would have expected the archeological spotlight, which threw into relief the tomb of Tutankhamen, to be diverted to the Ozark Mountains of Missouri and Arkansas? Who would have expected archeologists to find there anything but razorback "hawgs," moonshiners, chiggers and ticks in the northwestern corner of Arkansas? Nobody, you say? Yet two scientists from the Museum of the American Indian, Heye Foundation, New York, after months of arduous toil, have unearthed unmistakable evidences of a crude and primitive people, hitherto unknown, who lived there in caves and under overhanging bluffs perhaps *fifteen centuries* before Columbus discovered America. These people were, in a sense, cave dwellers or cliff dwellers, yet they are not to be confused with the Cliff Dwellers of Arizona. In fact, there is nothing to show that they were ever in close contact with any known peoples on the American continent.

Whence these primitive people came is as great an anthropological mystery as the origin of Stefansson's "Blond Eskimo" groups, which are thought by some ethnologists to be the descendants of the lost Scandinavian colonists of Greenland. And the approximate date and manner of the disappearance of these prehistoric people is equally mysterious. So recent is the discovery of their community sites that only a few of their crude stone axes and other objects have been photographed, and nothing from the rock shelters of the White River country of Arkansas and Missouri has as yet been placed on exhibition in the museum. The scientific staff has not even had time to decide upon a scientific name for these strange people, so for the time being they are referred to as the "Rock Shelter" people of the Ozark Mountains, or merely as "bluff dwellers."

Nothing is known of these "Rock Shelter" people except what has been learned from a study of their implements, clothing and partially mummified bodies—all in a wonderful state of preservation—and skeletons found buried in various community sites, for, unlike the Egyptians, they left no records. They were so primitive, in fact, that they did not even make pottery. Among the objects found buried in the bone-dry earth under the bluffs, however, were baskets of cane and wild hemp, varying in height from three inches to three feet, and perfectly preserved despite their probable age—*two thousand years.* These are not unlike the Indian baskets seen in the Southwest today. Also, strange as it may seem, they are similar to those now in use among the Indians of the Mississippi delta country. But so far the discoverers of the rock shelter ruins have found nothing that will throw light upon the probable origin of these paleolithic people.

The important thing to remember about the objects so far discovered is not merely that they are perhaps twenty centuries old, but that they are complete, and as serviceable as the day they were made. Heretofore, except in the few recorded instances of comparatively modern implements found in salt caves, the handles of Indian axes, the shafts of arrows and spears, the baskets, blankets, mats and other perishable parts of Indian implements and utensils, exposed to the elements and subject to alternate wet and dry weather, have quickly disintegrated. But in these Ozark specimens the entire implement—handle, thongs of sinew, leatherwood bark or twisted wild hemp—protected from the elements in the bone-dry shelters under the limestone bluffs, is complete and intact, as the photographs show. Never before have prehistoric implements, clothing, and utensils been found in such perfect condition. It gives one a queer feeling to grip the handle of a tomahawk that was grasped—and perhaps used to split the skull of an enemy—by one of these prehistoric bluff dwellers.

There was nothing modern about the "Rock Shelter" people. The scientists who discovered their ruins, M. R. Harrington and D. A. Cadzow, conservatively estimate that they lived at least fifteen hundred years ago under the bluffs of the White River. But it might just as easily have been two thousand or three thousand years ago. No one knows. As a people they were not even known to have existed until Harrington and Cadzow made these amazing discoveries. So primitive were they that they did not even bring the bow and arrow to a high state of development. But the discovery of a "spear-thrower" at one of their community sites—the first of its kind ever found in the United States—is a reminder that this implement was used thousands of years ago by the Mayas of Yucatan, the Aztecs of Mexico, and the Cliff Dwellers of Arizona. No one, of course, knows whether the bluff dwellers were an offshoot of one of these groups, but Harrington and Cadzow consider it doubtful. The spear-thrower, it might be added, is also used among the Eskimos today, yet these scientists say there is nothing in the Ozark Mountain discoveries to indicate that these primitive people migrated from the Arctic regions, or were ever in contact with Eskimo groups.

Perhaps the most amazing objects discovered in the rock shelters were several partially mummified bodies, wrapped in closely woven blankets of wild hemp, or fluffy robes of feathers, and buried several feet in the powdery earth in graves lined with six-inch layers of wild grass. At one place they found the partially mummified body of what once had been a great warrior, wrapped in a rabbit-skin robe, and buried with his bow and quiver of arrows. Clad in buckskin, with the beads still in place after perhaps twenty centuries, this warrior was an awe-inspiring sight, with parchment-like skin tightly drawn over his bones. The grave was lined with wild grass and cane, still well preserved, and a whole deerskin tanned to the softness of chamois, lay close at hand so that he would not lack clothing in the spirit land. His moccasins and leggings were still intact.

Sandals of woven wild grass, never before found in prehistoric ruins in the United States, and as durable and well preserved as the day they were made, were also unearthed. These would be too small for the average American, which indicates that these people were not large in size. The skeletons, too, are of ordinary height.

Buried with its former owner under an immense slab of limestone rock, so that he might have something with which to hoe his corn in the spirit world, the archeologists found an object hitherto unknown to science, a mussel-shell hoe, with the handle securely attached. The shell, the thongs of leatherwood bark and twisted hemp, and the wooden handle, were still in a perfect state of preservation, as the photograph shows. The same is true of arrows and spears; the original shafts of wood or wild cane are as tightly bound to the points as they were two thousand years ago. The blade of the stone axe shown in the accompanying photograph is wedged into a hole cut in the handle, so that the more the blade was used, the more tightly was it wedged into the handle. The comparatively modern practice was to split the wooden handle, insert the blade, and bind the whole with rawhide or other thongs.

A bag made of wild grass, and containing pumpkin and squash seeds, and corn and beans.

Moccasins and leggings of buckskin, finely stitched with deer sinew, and in a fair state of preservation, were also found under the bluffs. There were also samples of thread of sinew and wild hemp, and fish nets of different sized mesh, little the worse for their great age. A baby board, or papoose carrier, with the partially mummified body of the child still upon it, was found buried several feet beneath the surface of the earth under a bluff. The frame of the carrier is made of a single stalk of wild cane bent in the form of a U. Over this frame is a neatly woven mesh of the openwork, cross-warp sort, and the pattern differs only slightly from that of a modern cane-seated chair. Then there were baskets, which are the only clue Harrington and Cadzow now have regarding the probable origin of the "Rock Shelter" people. It will require months of painstaking labor to protect and preserve against disintegration the specimens already found, and as many months to catalog them properly. After they have been studied and compared with other prehistoric cultures by the scientific staff of the museum, a suitable scientific name for the bluff dwellers of the Ozarks will be decided upon.

Within the next few weeks one of the archeologists who helped to make these amazing discoveries will plant in one of the Middle Atlantic states some of the Indian corn found in the rock shelters. He is, moreover, willing to bet that it will grow, even though it is perhaps two thousand years old. Squash and pumpkin seeds, acorns, and beans were also found cached two and three feet underground, in pits lined with mats neatly woven of wild hemp. Some of these seeds will be planted, too, and the results closely watched.

That the "Rock Shelter" people practiced cremation is indicated by the discovery of small piles of calcined bones, and near them partially burned portions of hempen mats. This practice may account for the comparatively small number of skeletons found. In one of the skeletons that had not been cremated, a large spear head was found imbedded in the hip joint. The head of another skeleton had been crushed in, as if by a war club. These discoveries indicate that the "Rock Shelter" people fought among themselves, for the spear head was of domestic design.

While bows and arrows apparently were just coming into general use when these bluff dwellers were in their heydey, spears seem to have been freely utilized, and with them the thrower, to give the hunter greater leverage. Most of the paraphernalia found so far, it is thought, was cached under the bluffs when the primitive inhabitants moved inland from the river during the winter months. Their reason for doing this was that the rock shelters were open to the sweep of the wind in winter.

There are no pieces of pottery or other implements in the museum collection to indicate that these prehistoric people were ever in contact with other Indians. There was found in a community site at one point, however, a single "foreign" arrowhead, but that easily might have been carried to the bluff dwellers' neighborhood by a wounded deer, elk or buffalo, and found by a "Rock Shelter" squaw months or even years later when her lord and master brought in the carcass. And there might have been several reasons for keeping the arrowhead. In the first place, it was a foreign piece of flint, a souvenir. Secondly, the workmanship was far superior to their own, therefore some lessons could be learned from it by the group's arrowhead maker.

All this about the foreign arrowhead is, of course, the merest conjecture. But one of the fascinating things about archeology, and one of the reasons for the recently awakened interest in it, is that it doesn't fetter one's imagination. Moreover, anyone with or without scientific training can become deeply interested in this science. Nor is archeology without its romance, as we have observed in recent months in Egypt, Yucatan, Palestine, Mongolia and other sections of the globe. Let us see, for instance, how these "Rock Shelter" objects came to be discovered, and how they added a new chapter to American archeology.

In every part of the United States, and in many sections of Alaska, Canada and Mexico, one hears legends of "lost" mines. It was a legend of this sort that led indirectly to the discovery of the "Rock Shelter" community sites. In the present instance the lost mine was said to be one from which Spanish conquistadors, hundreds of years before, had taken huge fortunes in gold. Two American miners, after a long and fruitless search for the Spanish mine, came in the course of their prospecting upon what they believed were ordinary Indian relics. Knowing that a physician in a near-by town was an enthusiastic collector of such specimens, and being desirous of replenishing

"Bill" Gordon Is No Longer a Robinson Crusoe

Radio on Isolated Lighthouses Does Much to Relieve Monotony

By S. R. WINTERS

Radio fog-signal station at Sea Girt, New Jersey, Lighthouse, showing antenna towers. The automatic apparatus for transmitting radio signals, three dashes at brief intervals, is in a small room in the building. Apparatus is in charge of the keeper of the lighthouse.

The guard ship at the entrance to Ambrose Channel, New York Harbor, is equipped with both transmitting and receiving wireless apparatus. Also this tender is provided with a radio fog-signalling device whereby it may navigate safely in foggy weather.

"BILL" GORDON, until recently, was a modern Robinson Crusoe, by virtue of his occupation. He lives on an isolated island in Lake Erie, far from what we of the city call civilization. His visits ashore are infrequent. A keeper of a lighthouse is "Bill" Gordon—an outpost to navigation, if you please—and his duties are so compelling that he must maintain constant vigilance. A lonesome, monotonous existence must be his portion in life! Probably if the rewards of service in the form of an enduring satisfaction of having saved lives and alleviated suffering were less, the keeper of this lonely beacon of light to navigators would long since have quit his job for another, one offering greater financial remuneration and more companionship.

"Bill" Gordon—or William L. Gordon, to be more formal and to use the form in which it is on record in the offices of the Bureau of Lighthouses of the United States Department of Commerce—by the aid of a recent-day invention, is refashioning his entire mode of existence. He, not unlike the Robinson Crusoe in the pages of fiction, has discovered his man "Friday." Instead of the footprints of the visitor causing wonderment mingled with fear, as we are told in the fable of old, the invasion of "Friday" on this isolated island in Lake Erie brings to the ears of this modern Robinson Crusoe familiar voices, some of them speaking in resonant tones while others are pitched in strains of music. It marks the coming of the radio telephone to the lighthouse, wherein the "wonderful wireless waves" dispel dreariness on an island and put the keeper in friendly touch with the world beyond a waste of waters. William Gordon is thus enabled to cook his dinner according to a recipe of a household editor of a newspaper and, figuratively, goes to church twice on Sunday in a city with its teeming millions. This is true despite the fact that this keeper of a lighthouse remains constantly on watch on this Lake Erie island.

William L. Gordon, simply and yet in a fascinating manner, relates his story in a letter to the Bureau of Lighthouses in Washington. His words are quoted just as he put them on paper:

"I thought you might be interested to know that I have a small home-made radio set from which I receive, through WWJ, wireless broadcasting station of the Detroit *News,* the latest world news, the time, reports of sporting events, and so on, musical concerts and a talk every morning by the household editor, giving recipes for each day's dinner, also on the care of flowers and the home. From WCX, of the Detroit *Free Press* station, we hear concerts, speeches, and the news. On Sunday mornings and evenings we hear the services of the St. Paul's Cathedral, of Detroit, Michigan, through the broadcasting station of WWJ. As we do not get ashore very often we enjoy all this very much. I think a radio receiving set is a wonderful thing for isolated stations."

Doubtless, in name, there is but one William L. Gordon in the service of the Bureau of Lighthouses, but the story of his isolation before the introduction of a radio-telephone receiving set on this Lake Erie island is so typical, that in characterization, at least, he may be considered legion. In fact, there are approximately 500 keepers of lighthouses in the United States and outlying provinces. Cross the continent from Lake Erie to an isolated point in California, off the Pacific Coast, and the case of "Bill" Gordon is essentially duplicated. The location of the lighthouse, environment, and details of maintenance may differ, but the lonely life of the keeper is typified to an extreme degree. Here, on a rock that projects itself above the water, ten miles from Crescent City, in California, is perched the St. George Reef Light Station. The rock forming the base of this beacon to navigators is only slightly larger than the keeper's hut which it supports. At present, this "outpost" to our shipping interests is cut off from communication. If the keeper falls victim to an accident or becomes ill, he may languish in his lonely quarters for hours or even days without receiving medical aid. While he may be entitled to treatment at the nearest hospital maintained by the Public Health Service of the United States Treasury Department, lack of communication facilities does not permit him to take advantage of this opportunity. An arrangement recently perfected, however, will enable the keeper of the St. George Reef Light Station to overcome isolation and bridge the distance between a vast body of water and the shore. A radio-telephone transmitting and receiving outfit, obtained from the Signal Corps of the War Department and adaptable to this purpose, is to be installed in this light station situated on a rock and surrounded for miles by water. Communication for the transaction of business will be thus established and the keeper may dispel the dreariness of a lonely existence by "tapping" the ether for its burdens of song and story.

Similarly, a duplex system of radio-telephone communication is already in operation at two points in Alaska, where the service of the Bureau of Lighthouses, United States Department of Commerce, is an aid to navigation. The Scotch Cap Light Station and the Cape Sarichef Light Station (in the Aleutian Islands), about twelve miles apart, are enabled to keep in communication with each other by radio telephones. The proximity of the two light stations and the unexpected difficulties that sometimes arise in the maintenance of wireless facilities are told in a human and yet frank note written by the keeper of the Scotch Cap Light Station to the superintendent of lighthouses at Ketchikan, Alaska. The brief missive follows:

"I thought I would write and let you know how things are at the station. We have had some trouble with the phones here, and also at Cape Sarichef; for a while we got no signals from there, and I took a walk over to Cape Sarichef, where we found the trouble to be wrong wire connection. Some time afterward our transmission got out of order. It took us a week to correct it, and now Cape Sarichef gets our signal O. K. It may interest you to know that I have done some successful broadcasting from here by putting the transmitter inside the sound box of the phonograph, then starting the dynamo. They could hear the music very plainly at Cape Sarichef."

A typical lighthouse, this being located off the dangerous shoals of Cape Hatteras, North Carolina. The installation of radio telephones in this lighthouse, as contemplated, would certainly lessen the loneliness of the keepers.

The installation of radio-telephone transmitting and receiving apparatus at these two light stations in Alaska is in the interest of economy. Tenders of the Bureau of Lighthouses, navigating these waters, frequently encounter such stormy weather conditions as to prohibit their landing. The certainty of this condition was not established until wireless facilities were installed at these fixed beacons to navigators, an uncertainty that frequently caused vessels of the Department of Commerce to flounder about in the waters of this vicinity, unable to reach shore. The cost of maintaining a tender ranges from $400 to $500 a day, an expenditure to no avail if the vessels are prohibited by stormy weather to enter port. Constant radio-telephone communication from Scotch Cap and Cape Sarichef eliminates this element of chance, since with more or less certainty tenders of Uncle Sam are advised without delay of the conditions that may permit or debar landing at destination points in Alaska. Weather forecasts, dispatched by radio telephone, not unlikely renders possible the dissemination of reliable navigating conditions from twelve to twenty-four hours in advance.

The application of radio telegraphy as the absolutely essential and only form of communication available finds a striking example in the Navassa Light Station maintained by the Bureau of Lighthouses of the United States Department of Commerce in the West Indies. This beacon illuminates the pathway of passenger and cargo carrying vessels going through the Panama Canal. The Navassa Light Station is about sixty miles from Porto Rico, thirty miles west of Haiti, and ninety miles south of Guantanamo, the naval base of the United States in Cuba. The isolation of this light station is suggested by the fact that keepers of the lighthouse and radio-telegraph operators are the only inhabitants, exclusive of goats, dogs, and land crabs. This island takes the form of a volcanic sponge, being two miles long and one mile wide. Had it not been for the virtue of the installation of radio-telegraph apparatus on this island by the United States Navy Department, the only feasible means of communication between the building contractor and representatives of the Bureau of Lighthouses, the Navassa Light Station might still be a dream of future accomplishment. This appears to be an instance of how indispensable this vehicle of intelligence is where land-line wires terminate and vast stretches of waters begin.

The Bureau of Lighthouses, however, is limited in its application of radio telephony and telegraphy to lighthouses in the absence of funds appropriated for this specific purpose. The maintenance of wireless facilities at the stations already related in this article, installations that have been compelling as the only means of communication, constitutes the extent of the use of this vehicle of intelligence to the lighthouses proper. Negotiations are under way for the installation of sets at points in the Great Lakes, but at this time the contemplated plans have not assumed a definite aspect. Notwithstanding that no funds are available for the purchase of radio-telephone receiving sets, keepers at approximately fifty lighthouses have acquired and installed wireless receiving outfits at their "outposts" to navigation. Such formidable interest in the science of radio-telephony by these lighthouse keepers may be largely ascribed to the formation of a radio club in the Washington offices of the Bureau of Lighthouses.

The International Banker

READERS of the American Bankers' Association's free plate service, published gratis by country papers which discuss economic questions as parrots repeat what they are taught, have recently been regaled with a long story intended to prove "The International Banker a Myth," as the title boldly asserts, and as the author of it, Mr. Otto Kahn, rather shamelessly asserted.

In the statement of the National City Bank of New York as to its condition June 30 there appears among its assets the following item:

"Ownership of International Banking Corporation, $8,500,000."

Evidently the A. B. A. publicists are bent on disseminating myth-information.

What! A Business Viewpoint?

DURING recent years, the American public has come to a quite general recognition of the fact that politicians are not wholly successful in handling public business. Politicians are inclined to expend their efforts in pleasing the voters rather than serving the people; they are inclined to busy themselves with rewarding their followers with jobs; they like to do favors, in expectation of receiving favors in return.

A business man, who could retain his viewpoint during a term of public office, would not take the political attitude in public life. He would seek to serve the people in a permanent way, rather than cater to popular fads. He would seek to build up a public service which would permit Government to become a self-operating business institution. He would feel that the doing of favors, in return for past votes or future expectation of votes, would be a betrayal of trust.

These considerations have been accepted generally throughout the country as applying to domestic government. But there are still a few persons who insist that men trained in business would be distinct failures if they attacked the institution known as diplomacy.

International relations are popularly supposed to be fragile things. Only great experts can be trusted with the handling of the intimate details of diplomacy. State departments and foreign offices dwell in traditions, centuries old. That the common sense of a business man should attempt to deal with the problems of relationship between one nation and another, one people and another, is a suggestion which shocks many fine sensibilities.

True, the very persons who express horror at a business viewpoint of international business are the ones who tell you that Premier Poincare has failed in international diplomacy; and M. Poincare was trained to public service. They are the ones who will tell you that it was Bismarck's mistaken politics which set the world on fire a generation after his time; and Bismarck was born and bred to statecraft. They are the ones who rail at Lausanne, at Geneva, at Versailles, and at the score of other places where diplomats have met—and failed.

The truth is that statesmen, real and so-called, have for generations made a terrible mess of statecraft. Perhaps, it was not their fault. Perhaps, the smallness of some diplomats made them unable to appreciate with true vision the greatness of the things with which they dealt. Perhaps, the greatness of some statesmen made them unable to understand the smallness of the little things out of which great things are made.

The reasons are unimportant. The fact remains: Statesmen have failed. The record of their failure is written in a thousand wars, and the cost of failure has been paid through the centuries by the dead who lie under the battlefields of all the world.

And now comes a man who suggests that business men could do the job of statecraft better than the experts who have handled it. Not an unknown man, either. None other than Stanley Baldwin, Prime Minister of Great Britain.

Mr. Baldwin, speaking recently at a banquet in honor of Andrew W. Mellon, Secretary of the Treasury of the United States, said that the business arrangement for the refunding of the British Debt to the United States had been carried pleasantly and honorably. He continued:

"Neither the Governor of the Bank of England (who participated in the negotiations) nor Mr. Mellon nor I had ever at any stage of our lives been members of the legal profession, and we were all three, individually and collectively, far more business men than we were politicians or statesmen.

"I have often felt that, had it been possible to leave the settlement of Europe in the hands of business men, we would have arrived at some settlement long before this time."

Business men have been tried with good success in domestic business. Mr. Baldwin thinks they could be at least as much of a success in international business as have statesmen, past and present. His view is food for thought.

No More Bond Issues

MILWAUKEE is attracting some attention through a plan for the retirement of her debts. It is announced that the Wisconsin city has a plan, sanctioned by legislative act, whereby her debt will be wiped out.

An amortization plan has been adopted whereby the entire city debt will be paid within 40 years, and taxes will be reduced by a third, provided no new debt is created. It is planned to set aside annually $250,000 for a fund which is to accumulate until it reaches an amount equal to three-fourths of the bonded indebtedness. Thereafter, three-fourths of the annual income from this fund will be paid into the city treasury and the principal will be added to by the city's annual contribution plus one-fourth of the annual interest on the invested fund.

Milwaukee's intention to pay her debt is a wise one. If succeeding generations of public officials can resist the temptation to create new debts, her situation in 1963 will indeed be a fine one. She will be a sort of taxpayers' heaven.

But one feature of the Milwaukee plan may well challenge the attention of the curious world. Milwaukee intends to build up an invested fund. She intends to make money work for her, as it does for a few idle rich individuals. Many other cities have sinking funds which consist of bonds bought by the sinking fund authorities.

Such bonds must come from somewhere. If other cities in the country followed Milwaukee's example to its logical conclusion the country would be filled with municipal investment funds. Whence would come the bonds or other investments which would provide the interest and compound interest on which the city of the future might plan to live? If no cities or states were issuing bonds, there would be none to buy, except those of industrial institutions, or railroads. And such bonds often do not fulfill the requirements public investments demand.

Obviously, Milwaukee's plan of payment will not spread so rapidly as to make it reach the logical conclusion of absurdity. Someone must work, and neither cities nor men may look forward to a millennium when all can live on the interest of invested money.

The main feature of Milwaukee's plan is the one which must engage the serious thought of the country—the payment of public debts by some means, and the resolution to contract no new ones. Honesty with the future generations requires that the burden of principal and interest be not passed on to those who will not be benefited by this generation's expenditures.

Bewails Minnesota Revolt

THE *American Economist*, organ of the American Protective Tariff League, considers the recent senatorial election in Minnesota a distinct gain for the forces of Free Trade, in that, while neither candidate was an avowed protectionist, Johnson, the winner, left no room for misunderstanding his position, which is against a protective policy, while Preus, Republican nominee, was honest enough to express the belief that his party had overdone the business in the enactment of the Fordney-McCumber Act.

The *Economist* expresses the conviction that a different result would have been seen had Preus boldly asserted the Fordney measure to be his idea of a proper type of law, and at the same time berates protectionists of Minnesota for failure to give Preus loyal support under the circumstances.

"Governor Preus, if elected, would have affiliated with the Protectionists in the Senate," it says, "although his declarations in the campaign were not favorable to the policy of Protection."

If the *Economist's* opinion of Preus is justified, Minnesota is to be congratulated.

St. Mark's Experiment

AN INSPIRING experiment is being tried by the famous Church of St. Mark's-in-the-Bouwerie. It is an experiment, although the great Parable of the Good Samaritan, which might well have occasioned it, was told twenty centuries ago.

St. Mark's is attempting to combine in one institution the preaching of the finest ideals of religious inspiration with the practice of the medical science. The innovation, if such it may be called, has been designated a body-and-soul clinic by its founders. Those who are to be the beneficiaries of this adventure into practical religion are the inhabitants of darkest Manhattan Island—the derelicts of the lower East Side, men and women from whom ambition and hope have long since fled and who wear the marks of disease, of filth, of crime.

Doctors, surgeons, dentists and nurses are to be provided for those whose poverty had made those envoys of science beyond attainment. Hospitals and sanitariums are to be arranged for those who need them. The preaching of religion is, of course, the prime motive of those who inspire the body-and-soul clinic, but it will be preaching in which the hearer will be made physically and mentally comfortable before he is offered the opportunity of listening.

In a sense the body-and-soul clinic is the bringing home of the spirit which the churches have manifested in their foreign missions. Natives of New Guinea, of Samoa, of Siam, and of wherever Christian missions have been established, have been afforded the benefits of medical and educational assistance by those who came to teach them Gospel. St. Mark's now wisely offers to those whom it seeks to lead to the Faith, the physical and mental care which poverty has denied. The physician and the nurse will repair the body and soothe the mind. The way will be made more easy for the rector to minister to the soul.

Not Willing to Work

ONE of the discouraging effects of charity is that recipients become reconciled to their fate and lose ambition to become self-sustaining. The curse of alms is its demoralization of character in the recipient.

For ten years, we are told, a Russian immigrant has toiled in this country with the end in view to unite his family in this country. The task has been prodigious, the more so because in addition to saving the money needed, he must assist in feeding and clothing them there. "Starving Russia" was a reality to him, and the constant fear that his loved ones might be suffering was the torturing goad to increased effort and still greater privation on the part of the father that the day might come when, in this land of opportunity, they might be gathered about him and all enjoy the prosperity and freedom found only here.

The day came not long ago. A daughter and her husband were yet in Russia, among those fed on charity. The relief agent who was the messenger of the glad tidings to the family in Russia reports they refuse to come to America, the man evidently in fear of being compelled to work.

"Let Peter Reisel send food and money and we are well off in Russia," was the reported answer of the son-in-law to the tendered transportation to America.

What a field for speculation as to human nature is opened in this incident!

Mr. Ford's Page

IT HAS been remarked upon this page before, the homely adage, that when you get through saving the world or the nation you will find something to do in your own back yard or on your own home. The wisdom of this, first applied to individuals, is now applied to nations, and especially to the United States. For we seem to be the only people in the world desired to neglect our own back yards or farms, so to speak—neglect our own national affairs—to go out and save the world. Recently fifteen distinguished names have been added to the latest piece of British propaganda for this purpose, and they are all names well known to the press services and the lecture managers.

Our government, perhaps, has not made it plain as yet why we keep out. An official statement has been made, notable in its lack of reasons. It may not be diplomatic to give reasons—other diplomats may riddle them. Our government has made it clear that the people of the United States will not relate themselves officially and for concerted action with those who are called the military victors in the late war, and with whom we were rightfully associated in that war, this refusal being made not out of any disrespect for them, nor out of any lack of sympathy for their problems, but just that we will not! There the matter practically stands as far as official pronouncement goes, but no reason is given for the "will not." This omission is unfortunate because there are many reasons, and propaganda as well as a snobbish desire to stand well with visiting European notables has prevented the plain statement and direct application of the reasons.

As Americans, we have proved our sympathy for the people of Europe in the form of hundreds of millions of dollars in personal help accorded them. We have sent man after man and commission after commission, not to mention scores and hundreds of personal pilgrimages, undertaken to discover the truth. We have searched every principle and every possibility for a clue to our duty in the matter. And when propagandist spokesmen say, no matter how sincerely, that our failure to "do something" is due to our lack of sympathy, our provincialism of knowledge, our fear to entangle ourselves in European affairs, they simply do not know whereof they speak—and that fact our Government has the right to make clear to the Governments of Europe. We have been charged with these sorts of remissness long enough to make a rejoinder permissible if not necessary.

There was a time when people in the United States really desired to interfere in the affairs of Europe. Millions of immigrants, tasting the tone of life in this Republic, made the pressure of their critical opinion felt in their respective home lands. This is a fact apparently forgotten. Germany can think of the fine stock of folks who left her in '48, and even England can think of her always icy shoulder toward the freer and more progressive opinion of her colonials. America was then reminded that she had enough in her own affairs to keep her busy—which was probably true. But the result was to bring a closer scrutiny of that system which resented the more progressive view.

It is that system which is dying now. America does not believe that it ought to live or is destined to live. As has been insisted upon before on this page, Europeans in the United States, our large population whose roots are in other home lands, have never urged the Government of the United States to save the system which is dying in Europe today. They know that with that system removed, the people of Europe can stand up, the burden off their shoulders.

ALL hindrances to our new Administration getting to work on national problems should at once be removed. There are things to be done in the coal situation and the transportation system and the general industrial power problem which the President can do by virtue of his office and ought to do. The chief possible hindrance is "foreign relations," and this matter can be laid for the time by a simple explanation of why the American nation is out of it. Thus far our Government has made announcements to Europe but no explanations, and we have explanations which would be as effectual upon the mind of the people of Europe as were Wilson's Fourteen Points. The explanation made and the distraction of the public mind stopped, the way is clear to do what has too long stood undone upon our pressing needs.

Then, again, Europe has the League of Nations. That is, we are always being told that she has. She advertises it widely and ceaselessly advises Americans of the advisability of entering that League. There is no question whatever of America entering the League when a real League comes. But as we see Europe confronted with fatal disruption by a matter which she dare not take to the League of Nations, what are we to think of it? Geneva is not far from Paris, Brussels or London, and yet a suggestion to take the question of the Ruhr occupation to the League of Nations would probably be more destructive of "peace" in Europe than is that occupation itself! But if the United States were a member of the League, and upon entrance into the League should say, in our straightforward way, "Well, let's first take up this Ruhr business," we should precipitate an explosion which every European statesman admits that he foresees. And the United States is not now in the business of precipitating explosions in Europe.

There is nothing wrong with the attitude of the United States in this matter, but there may be some lack in the completeness with which we have explained our attitude to the Governments and Peoples of Europe. Our full explanation, if our statesmen are capable of making it, might be a more effective service than joining the League. It was Wilson's Fourteen Points—a plain statement of as yet unadopted principles—which admittedly undermined the type of mind at war with us. Why should it be thought impossible that a full and friendly explanation of our present attitude would have a like effect on the state of mind from which Europe principally suffers now?

If that were done there would be left a large tract of unoccupied mind in this country which would immediately become occupied by the thought that our government should get busy on things to be done at home. Maybe politicians would like to keep the foreign question in the offing (like the old "Balkan war cloud") as a means of distracting the public mind from more immediate problems. But it is hoped that our new President has a more direct mind.

There is, for one instance, the annual coal situation. Whether or not a strike occurs it is pretty certain that the domestic supply will suffer this year its usual manipulation to the hurt of the man whose purchasing power runs from half a ton to two or three tons. That is the man we want to look after, with his wife and family. And to do that it will become necessary to look after a few other men who make money out of strikes and shortages and "government regulation." Let President Coolidge take an hour or so and look into the benefits of "government regulation" to the coal profiteers. Let him look into the pretended inability of the railroads to move coal. Let him look into the conspiratorial efforts to prevent the foresighted and honest activities of those who try to get the public its coal at an honest price. And he *can* do this because he is President of the United States and we would gladly believe that just because he *is* President he deeply and determinedly desires to do it.

And after that he may devote time to lifting the burden off the coal supply and transportation by developing other sources of power that require no coal. Canals that will bear coal cheaply to the great cities, and water power development that will decrease the amount of coal required for industry—these come well within the scope of his official interest and duty. And he will find, what no other President has had the chance to find, that industry, from managers to men, will be behind him. And that, regardless of party, constitutes the people of the United States.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Legends of Lovely Isle Royal Find Origin With Indians

Apart From Stress and Storm of Our Everyday Life Sits One of Nature's Beautiful Children

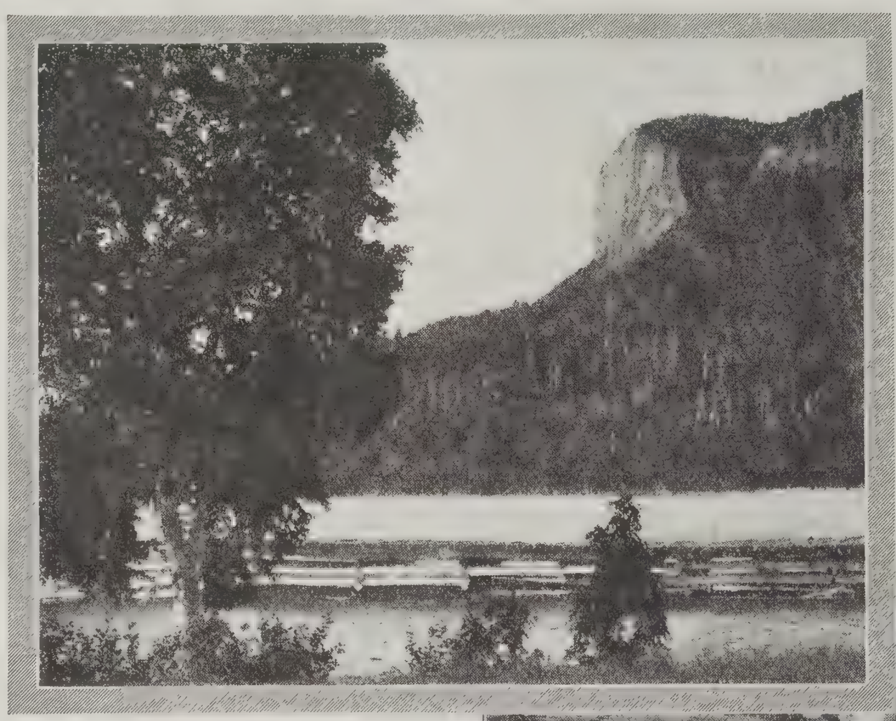
By RICHARD A. HASTE

Grand Arch, northeast end of island.

APART from the whir and buzz and turmoil of civilized life, secure in the silence of a million years, and strangely calm, sits Isle Royal, one of the first-born of Earth's children, bathing her feet in the cold waters of Lake Superior. Fifty miles away to the southeast is Keweenaw Point; to the rock-girt Canadian shore it is twenty miles; to the east stretch three hundred miles of unobstructed emerald billowing. It is an Isle Royal indeed—from southwest to northeast it is forty miles and ten long miles will scarce span its widest part.

It is a world in itself and a comparatively wild one, for here one may find lakes and rivers and beautiful cascades, mountains and plains and quiet glens, capes and promontories and cool, deep canyons, little islets where the gulls nest and sunny landlocked bays where these same white-winged scavengers of the sea gather to feed, to quarrel and to complain. And this primal land lies but twelve hours from Duluth, fifteen hours by rail and water from St. Paul and but twenty-four hours from Chicago.

You will find but few places between the oceans comparable with this northern jungle, set apart and guarded by the blue waters of the great lake. Here within easy reach of the busy marts of commerce you may get back to the habits of aboriginal man. You may camp by yourself among the wild things of the woods or upon rock-bound shores within the thunderous cannonade of the breakers, sleep within the vigil of the stars and wake with the scent of fern and balsam strong in your nostrils.



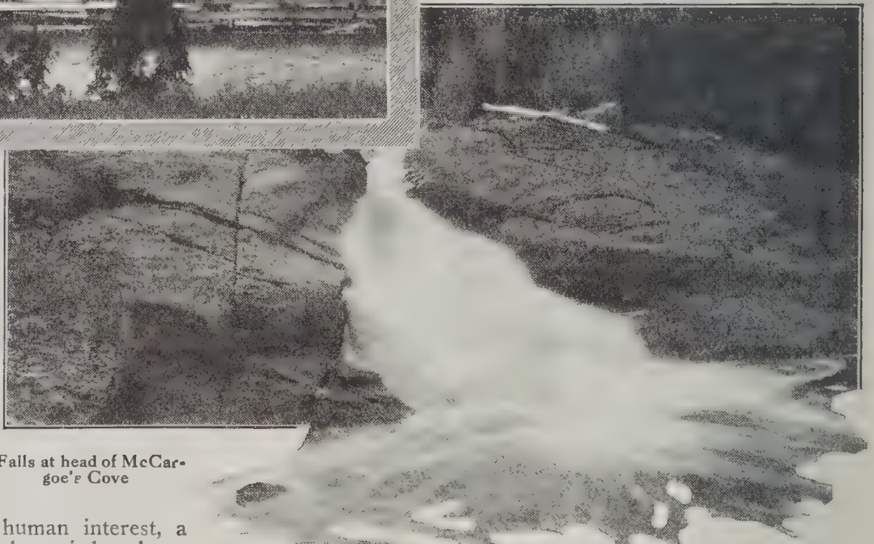
Thunder Cape. "The bare basaltic ledges that look out upon the sea."

Isle Royal presents in miniature the physical features of a full-sized continent. The shores are rugged and broken with numerous fiords and great roadsteads protected by outlying islands. The interior is wooded with pine and spruce, while the sunny slopes that stoop down to the bays are dressed in delicate mantles of birch and poplar and soft maple, with here and there splashes of deep green balsam. Near the center of the island on the southeast slope is Lake Siskowit. Miniature mountain streams wind their way through the tangled woods singing undisturbed the songs of solitude.

To see Isle Royal thus on an August day, smiling in the sun, the blue waters gently lapping the rock-strewn shore, the green hills looking down cool and silent, it presents a picture of unobtrusive quiet.

But there are times when the sky is gray—when the winds rush from their caves, filling the air with wrack and the island with dismal moanings and strange nightmare hootings. For three hundred miles there is no break to the awful sweep of the wind, and when the storm comes from the northeast, whirling the sea in a mighty waltz, it is worth years of ordinary life to see this elemental war and feel yourself a part of it. It is then that the assaulting legions of the deep hurl their ranks against the shore, only to be rolled back in impotent rage before the rocky battlements. There will be a truce for a week, a month, seldom for more than two, and then the stupendous battle is renewed. Thus for eons has the island fought the sea. Along the southeast shore you may see evidences of this irrepressible conflict. The northeast angle, where the storms are fiercest, is seamed and cut by the incessant action of the waves into deep narrow bays between which extend far out to sea, like the bony fingers of a mighty hand, five projecting ridges of basaltic rock. Aside from this the action of the wind and waves has not changed in any marked degree the original form of the island.

Politically, Isle Royal belongs to the United States and is a part of Michigan. But the greater part of it is owned by a British syndicate and is held for its reputed mineral possibilities. A few scattered summer cottages fringe the bays and a gaunt hotel or two furnish shelter for the tourists. During the summer, from June to November, steamers call to take on fish and drop here and there a victim of hay fever or a nerve-shattered refugee from the cities of the south. And then for six long months the island is icebound—cut off from the world as completely as if it were an island of the moon. The permanent inhabitants consist of some hundred fishermen and their families and the caretakers of the "company's" property.



Falls at head of McCargoe's Cove

But the wildness of Isle Royal is not its principal charm. It has a history, a history full of human interest, a history in which Indian legends, weird and uncanny, are found intermingled with hard material business facts. The brooding solitude that hangs like a palpable mist over the island is not the solitude of silent forest and storm-swept shore alone, but to this is added the solitude of the grave. Ghosts haunt the forest paths and sit upon the bare basaltic ledges that look out upon the sea—ghosts of dead enterprises—ghosts of a vanished race.

The early explorers of the St. Lawrence River learned from the Indians of a place to the west where *red copper* was to be found in abundance. It was many moons' journey toward the setting sun, beyond the river "Saguenay"—in the big sea water where there was a floating island of pure copper. As an evidence of the truth of their statements and an earnest of good faith, they made the white men presents of various instruments and trinkets wrought out of the free metal. This report of a floating island of copper remained an Indian tradition, told with a variety of ornaments to the French explorers until about the year 1665, when Pierre Radisson visited the upper part of Lake Superior and located definitely the island, and verified to some extent its reputed wealth of copper. He learned also that many generations before, a strange people had come in great numbers from the south for copper—that they had found it in great quantities on the island, and notwithstanding the repeated warnings of Missibizi, the god of the sea, they persisted in coming year after year in increasing numbers and taking away with them vast quantities of the precious metal. At last, angered at their persistence, Missibizi tried to overwhelm them as they passed from the island to Keweenaw Point on the mainland, but they had canoes so large that they could outride the worst storms—and they laughed at Missibizi in his anger. So he bided his time, until drawn by their hunger for copper the whole people had gathered on the island, then he withdrew its foundations. Not one of the impudent invaders escaped. For the space of one moon the island lay at the bottom of the sea. And when the island again appeared it never remained long in one place, but floated hither and thither with the wind, so that no man could know where to find it. This is the origin of the legend of the floating island.

Father Dablon, a Jesuit priest located at St. Espirit, a mission on the south shore, writes in the *Relations of the Jesuits,* under date of 1663, of this island, and recounts a local and possibly more recent Indian tradition concerning it. According to this story four men were forced by stress of weather to land on the island. In the preparation of their meal, which was accomplished by placing red-hot stones in a bark vessel filled with water, they discovered that what they had taken for stones were in fact lumps of free copper. Not knowing where they were, they filled their canoe with these bits of copper and others which they found on the beach and attempted to leave the island, but were arrested by a voice exclaiming: *"Who are these robbers that would steal the playthings of my children?"* The men did not heed the voice, nor turn back, whereupon one of the men died. After reaching land two others were stricken. The fourth managed to reach his people to tell the tale, when he too went the way of his companions. In commenting on this legend, Father Dablon says: "Some think the voice was that of Missibizi, the god of the sea, others are of the opinion that it was the voice of Memogovissinois, the special guardian of the treasures of the island. And from that day to this no Indian has visited the island, nor will they sail in its direction."

It fell to Father Allouez a few years later to conduct a systematic investigation of the island of copper. The Indians whom he pressed into service were taciturn and afforded the Father but little aid, but he managed to locate, nevertheless, several copper deposits. The floating island was proved to be a myth, but the real island was there and so was the copper and also traces of ancient mines. These tallied with the Indian accounts of "Minong"—the place where the ancient people

Chinese "Thinker" in Cloth Features Collection

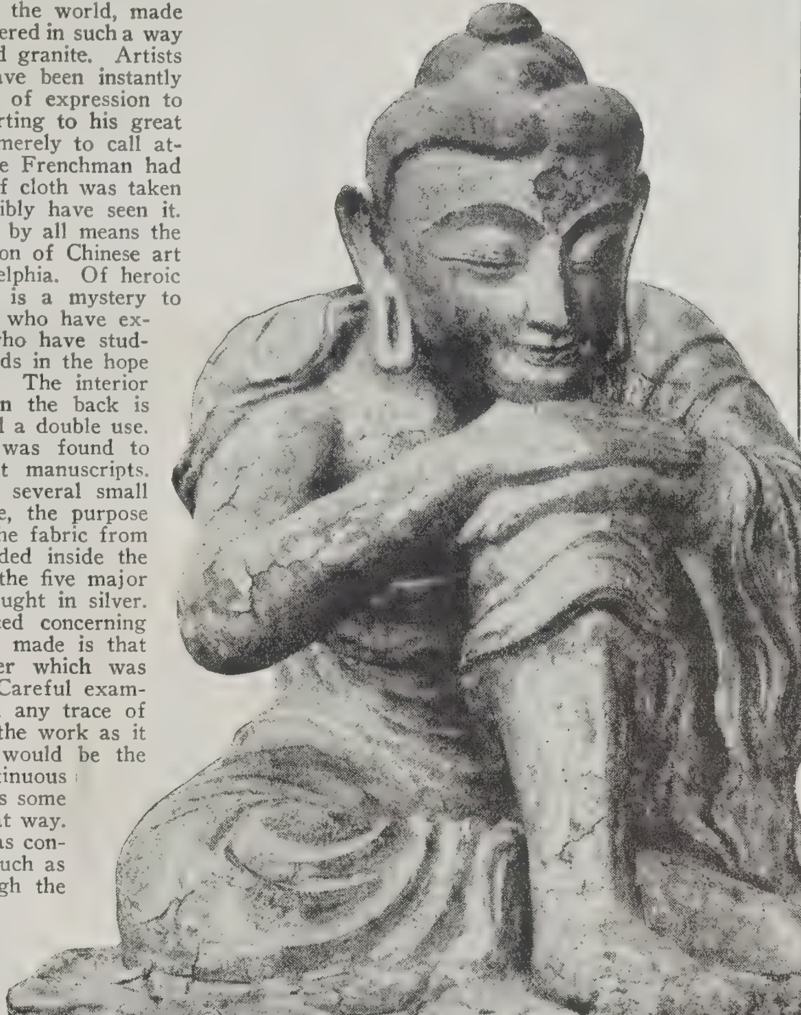
Method of Construction Employed in Oriental Work a Puzzle to Artists

By WILLIAM A. M'GARRY

This is the second of two articles by Mr. McGarry.

A FEW years ago there was unveiled in France a huge bronze work by Rodin, part of a colossal group, which has been the subject of discussion in art circles ever since. It is called "The Thinker." The sculptor worked on it for many years. Shortly after he had finished it there was smuggled out of China the only known statue of its kind in the world, made entirely of cloth, but painted and lacquered in such a way as to give the impression of decorated granite. Artists who have seen the Chinese work have been instantly impressed with its striking similarity of expression to that which Rodin succeeded in imparting to his great achievement. The likeness is noted merely to call attention to the coincidence, because the Frenchman had finished his work before the statue of cloth was taken out of China and he could not possibly have seen it.

That statue—the work in cloth—is by all means the most interesting figure in the exhibition of Chinese art at the University Museum, in Philadelphia. Of heroic size, the method of its construction is a mystery to artists from all parts of the country who have examined it and to the archeologists who have studied hundreds of ancient oriental records in the hope of learning something of its history. The interior of the great work is hollow, and in the back is a small aperture that may have served a double use. When the statue was examined it was found to contain a large collection of ancient manuscripts. There also were suspended within it several small bags containing perfumes and incense, the purpose of which presumably was to protect the fabric from insects. In another bag, also suspended inside the statue, was found a complete set of the five major human internal organs, delicately wrought in silver.

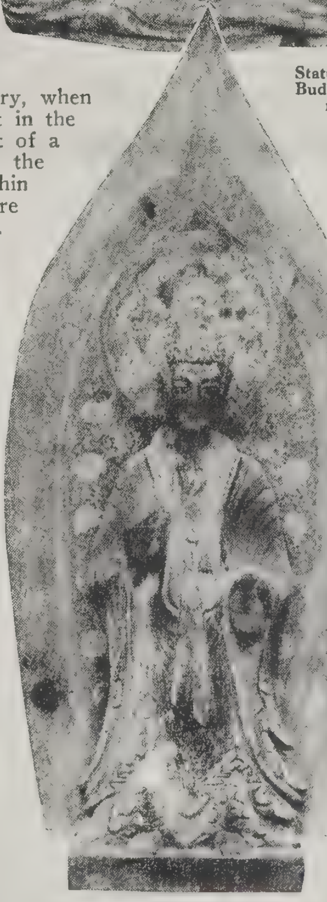


Statue of cloth, lacquered, T'ang dynasty, representing a disciple of Buddha and strikingly similar to Rodin's "The Thinker," in university museum collection. The only known example of this technique.

Rodin's "The Thinker."

One theory that has been advanced concerning the method by which the statue was made is that a framework was first set up, over which was wound innumerable yards of cloth. Careful examination, however, has failed to reveal any trace of such a framework in the interior of the work as it stands today. The obvious method would be the use of a cast, but as the cloth is continuous and there is no sign of a joint there is some doubt that the statue was made in that way. It has been suggested that the work was constructed on a base of some material such as clay, which was then dug out through the aperture in the back. The fabric is a cotton cloth, and there are many layers of it. Over that was a kind of lacquer, a little of which has broken away in spots. Originally also there was some color used in the finish, and traces of that remain faintly visible.

The posture is a familiar one in Chinese statuary of the seventh century, when the art of sculpture reached its height in the Flowery Kingdom. The figure is that of a disciple of Buddha, half squatting, the hands resting on one knee and the chin resting on the hands. The eyes are closed, and there is a smile on the lips. Originally a huge precious stone was set in the center of the forehead, but it has long since disappeared. The socket for its setting is still visible, however. Every line of the figure, and every fold of the gracefully flowing robes, is as distinct and clear-cut as though carved in stone or wood.



The Maitreya, or Buddhist Messiah.

Another example in the collection almost as rare as the statue of cloth is a huge wood carving of a Bodhisattva, or Buddhist Saint. Experts in oriental art who have scoured the museums of the world, including all the large Chinese collections, say there are only three of the type.

Like the statue of cloth, it is dated approximately during the height of the T'ang dynasty, in the seventh century of this era, when Chinese art reached its finest forms of expression. The features are done in the classic style of that period. But apart from the exquisite modeling, particularly in the hands, the work is unusual because of the pose. The figure is sitting on a block of stone or marble, the elbow resting on a sort of short pedestal. One knee is drawn up as a rest for the left arm. The history of the statue is not known, but it is believed that it was made originally for a niche in some ancient tomb or temple.

Among the earlier works in the collection is a Buddhist stele of the Northern Wei dynasty, a Tartar house which ruled from 386 to 549 A. D. The front of it is a bas-relief of the Buddha, half life-size, and the designs on the reverse consist of scenes from his early life, including a picture of the miraculous birth. It is described as follows by Dr. Carl W. Bishop, of the University Museum:

"Maya, the young wife of S'uddo dana, Prince of the S'akya clan, accompanied by six of her waiting women, stands in the shade of the sacred sala tree, a bough of which she grasps with her right hand. The infant Buddha appears just issuing from his mother's right sleeve, to be received in the outstretched arms of a kneeling attendant. Signs are said to have accompanied the birth of the Buddha, among them flashes of five colored lights and the appearance of miraculous flowers. It is these, apparently, that the artist has attempted to show in the central portion of the stele."

Engraving scenes on stone has been a fine art in China for thousands of years. At one stage it reached a point of perfection during which paintings made on silk were transferred to the rock. The collection includes an example in which a huge flat surface more than six feet high has been covered with an intricate tracery of scenes including landscapes, houses, individual figures of men and animals, and processions presumed to represent the Buddhist conception of life in heaven. A number of smaller and cruder works of this type had been known, but the dates could not be fixed. The piece in the museum collection is dated in the Wei dynasty, and it contains the names of all the craftsmen who worked in producing it. The front contains a statue in high relief of the Maitreya, or likeness of Buddha as he is expected by the faithful to look when he returns to earth.

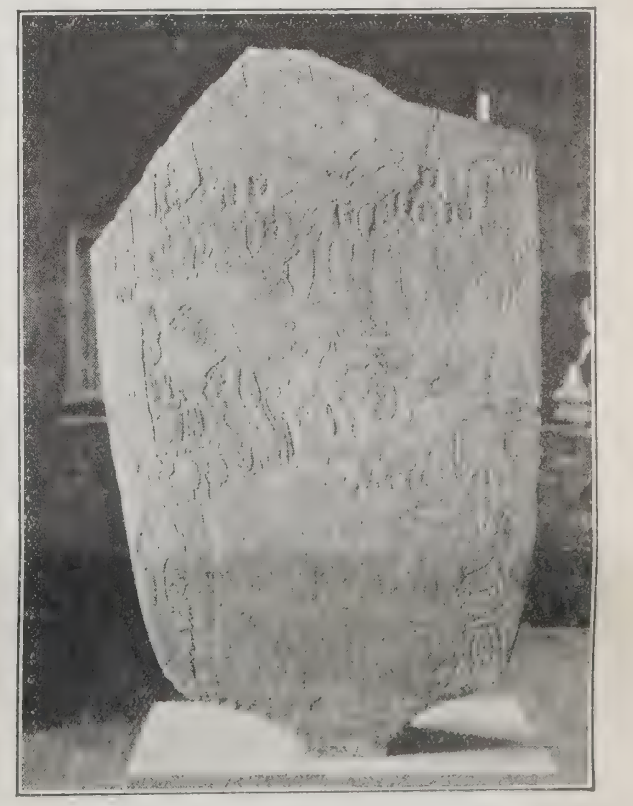
In the bronzes the collection contains large numbers of vases of different periods, and also some extraordinary statuary. One of particularly intricate design and workmanship is the likeness of "The Precious Guru," founder of Lamaism. The collection also includes more than 50 paintings on silk of the more modern dynasties. Examples of those done in earlier years are virtually unknown. Painting on silk reached the height of its achievement during the Sung dynasty, from 960 to 1277 A. D. In the Ming dynasty, from 1368 to 1644, the art of China began to decline, but there are also examples of some excellent work done during that period.

By far the larger part of the exhibit is given over to the work of the T'ang artists, but the attempt has been made throughout to arrange the examples according to art periods, rather than by dynasties. It was in the T'ang period that Chinese sculptors first began to reach a rugged strength that many authorities compare favorably with the best work of the Greeks in stone. At all times there was a trace of delicacy in oriental art rarely achieved in the East, and even in the crude early works that is quite noticeable.

"The civilizing influences set in motion in China during the seventh, eighth and ninth centuries of our era," says Dr. Bishop, "have become an integral part of the world civilization of the present, and only expert and painstaking analysis could disclose, even in small part, which elements in particular we owe to the enlightened policies of the government set up by T'ang T'ai-tsung. As a single example, however, may be cited the case of the mariner's compass. The liberal commercial laws of this period attracted to the Chinese seaports many Arab traders—men filled with the same spirit of enterprise and adventure as that which animated the soul of Sindbad the Sailor. From the Chinese these ready-witted men learned the use of the compass, and carried it eventually to the Mediterranean. There it was taken up, at first with superstitious fear and trembling, by European navigators, in whose hands, in the fullness of time, it rendered possible the extension of civilization over the face of the globe.

"Great as was the reign of T'ang T'ai-tsung in every field of human endeavor, nowhere was it greater than in its art. Unlike that of some of the later dynasties, this art was in no sense a conscious attempt to imitate and revive the canons and ideals of a past age. It was a wholly spontaneous development, a natural outgrowth of the spirit of the time. For many of its features, as we now know, it was indebted to influences originating in Persia. Another foreign influence in the art of the T'ang period was that exerted by Buddhism.

"Foreign visitors to Peking usually go out to see the famous tombs of the Ming emperors in their romantic valley in the hills to the north of the great city, and all who do so are impressed with the long series of figures, human and animal and mythical, which line the avenue of approach.



Engraving on stone of the miraculous birth of Buddha.

Mr. Mencken and the Joys of Romanticism

Is He Qualified to Discuss American Life, Contributor Asks

By LEWIS WORTHINGTON SMITH

IN AN age of romance one of the highest and most joyous notes is that of abandon. Ever since Eve ate the apple in the Garden of Eden and thrilled with a new taste men have dreamed of discovering the supreme happiness in letting themselves go. They have fretted at the chains of circumstance and, as far as possible, have overleaped the hard walls of fact to play in the pleasant meadows of illusion. In the world of human intercourse as such, the world in which it is the chief business of existence to say things to one another, this aspiration takes a very definite form. It becomes a longing for freedom of speech, and freedom of speech—utter, complete, and untainted—is freedom to say what one pleases, whether true or false, oppressive or alluring, delightful or disgusting

Indeed, it is the charm of a romantic age that we lie a little to ourselves, that we have daydreams. If this method of turning the world into a place of romantic delight is a pleasant thing for our dual selves, it is not excessively unreasonable to think that it may be a happy activity in our relations with others. It should give pleasure to both the speaker and the hearer. It is a rather common understanding that that is just the poet's business—to gild, not the lily only, but also the door of the brothel and some other things naturally unseemly. The joys even of mendacity, then, are to be accounted quite legitimate and regular accompaniments of the romantic state of mind. Only the unimaginative, the stolid and fact-enthralled, would refuse the happiness that he may have in a fantastic embroidery of fact.

The Case of Mencken

THERE are certain classes of men whose occupations, it may be necessary to acknowledge, more or less shut them out from the romantic fellowship. Philosophers, professors and puritans must, as a general rule, be satisfied with telling the truth. They must tie themselves to earth a little. Should it become known that the philosopher has fallen away from his allegiance to truth, he must look for the immediate appointment of a successor. The professor has the same handicap upon the exercise of his romantic tendencies. The case with the puritan is too obvious for comment. The eroticist has debarred him from the romantic world. Romanticism is essentially a doctrine and a practice of variety, fullness, change. Any one who believes in having but one helpmate of the other sex at a time and holds to the opinion that he should leave her only for just cause must not think of being received into the romantic fold. Certainly he can have no affiliations with the romanticism of the left. Along with the philosopher and the professor, therefore, the puritan must indubitably accept his exclusion from the company of those who may properly give themselves the pleasures of romanticism.

Everyone recognizes that there are romanticists and romanticists, that some of them are agreeable and some of them disagreeable. For a variety of reasons, including the fact that they are disagreeable, cheating tradesmen and auctioneers, promoters of "blue sky" ventures and fellows of that ilk, horse traders of the days before the motor car, may properly have it suggested to them that romancing is not always the best policy.

For some other reasons, chiefly that their play of imagination has emotional consequences that at least approach and often actually are the agreeable, two other wholly different classes of persons belong pre-eminently to the romantically elect. They are the makers of musical comedies and religious revivalists.

The case for the first of these groups is somewhat as follows. A musical comedy is a play in which it would be absurd to have the story managed as realistically as it is in life. Some one has quoted Carlyle, and I trust correctly, as having said that, when anything is too foolish for speech, it can be sung. Musical comedy seems to have been invented especially to meet this need. Having a good bit of fiction in one's mind, a fiction so fantastically delightful as to defy and impoverish speech, there is just one thing for the happy inventor of the fiction to do. Let him take an hour or two for turning it into words, and then let him call in an inventor of vocal and instrumental accompaniments. If this coadjutor is a tuneful fellow, the thing is done and the world is charmed with romance.

It is the business of the revivalist, his proper business, to appeal to the emotions and the sentiments of the unawakened. One thing he must realize from the first, or, like the philosopher who forgets his love of truth, he will need to be prepared for the early appointment of a successor. He must see to it that he does not deaden his appeals by a manner too much in the way of matter of fact. His business is not with theology. He must touch upon it, certainly, but, if he is caught laboring to tell the truth about it, no one will come to the mourner's bench. His hearers will be cold. A Billy Sunday with his hearers cold is, for all practical purposes, not Billy Sunday at all. Much as he may wish to, then, even the eroticist cannot well refuse a place in the romantic fellowship to the revivalist.

It is easy to pass from musical comedy and evangelism to Mr. H. L. Mencken. No one more than he delights in those raptures of romancing that one associates with the abandon of the singing show and the enthusiasm of the camp meeting. As an emotionalist, a sentimentalist, a romanticist, he lets himself go with the fine joy of absolute unrestraint. About that there can be not the slightest doubt. Our consideration of him may, then, pass at once to another question. Is a sentimentalist the proper person to write literary criticism? Is he qualified to discuss American life? Does or does not the business of inventing fictions about the Anglo-Norman in England and America come within the field of a just understanding of his privileges? That is, to reduce this to its oneness, may a critic properly adopt the license in the matter of truth-telling of an emotional evangelist, or should he count himself in with the philosopher and the puritan as being, in the nature of his occupation and his pretensions, somewhat held back from indulgence in fantasies and illusions?

It has always been part of my creed that a literary critic ought not to allow himself to play appreciably with too self-evident, or, perhaps I should say, too self-conscious falsehood. At the same time it cannot be denied that one of the justifications for some deviation from pure literalism as a kind of literary mode within the limits of the law of letters and of literary schools may be advanced for Mr. Mencken. He has achieved the art of presenting his fictions pleasantly. We cannot class him wholly with the disagreeable romanticists This is not at all because he tells pleasant truths. On that count he is as little romantic as a cow out in the pasture, to speak of no animal less engaging. The glamour that he manages to throw over the distortion of fact and of rational judgment that is his chief capital as a literary craftsman is, not the glamour of its substance, but the glamour of its dress, the glamour of style. Bald, unadorned enlargement upon fact is never a thing to charm. It is something beyond the ordinary for a writer to escape that pitfall. It is something at least unusual for a scribbler to touch the thinnest of fantasies with the opacity of verisimilitude, and to do it by the mere gift of a compelling style. Perhaps it will have to be acknowledged that to do these things is really a great deal. If it can be accomplished through literary style, that style is worth looking at.

If style should be the expression of personality, as the rhetoricians assume, then Mr. Mencken's style approaches perfection. If a good style is one that fits itself to its subject matter with something of the neatness of a fine glove to the hand, then again Mr. Mencken's style is admirable. With the recognition of so much, the hand in the glove is the next thing to be considered.

There is often a great deal to be made out of the shape of a hand. Figuratively, at least, Mr. Mencken's hand is not slender, not delicate, not shapely, not the hand of a gentleman or an artist. It is the hand of a cowboy. It holds the quirt and stings the maverick's flanks with it remorselessly. Riding, riding, riding, the owner of the hand shoots as he rides, and he shoots to hit, regardless of the hittee's race, color or previous condition of rectitude. Mr. Mencken's chief aim is to bring something down, not to decide what may most fittingly draw his fire, and he prefers a shotgun with a load as heavy as it will carry. He has the assassin's desire for blood, not the sportsman's delight in a difficult shot. Perhaps he prefers the blood of those who are offensive to him by reason of their being both intelligent and honest, but the smell of blood of any sort is a joy to his nostrils.

Strident Volubility

THE glove that fits Mr. Mencken's hand is quite as clearly a cowboy's glove. His style has no nuances, no shading, no subtleties, no involutions, no interplay of various rhythms, no cadences. It is wonderfully vigorous and tireless, and it is quite as wonderfully undiscriminating. It has no rests, no quietudes, no loiterings of easy humor with good fellowship, and all its purple patches are blood red. The artist who is also a gentleman and so a man of taste has two great affections. One of these, even though he is a romanticist, is an affection for truth. The other, the more especially if he is a romanticist, is an affection for beauty. Mr. Mencken hates truth with an unswerving fidelity of passion, and beauty he knows only as a word It is because of his consequent inability to be sincerely the artist, because the joys of audacity mean more to him than the joys of artistry, that his sentences march forward with the violence of a Wagner overture and the formlessness of a rataplan of jazz.

From the point of view of the critic, Mr. Mencken has one virtue that is very convenient. His writing is so uniform that four or five consecutive sentences are sufficient to constitute a revelation of the total quality of his style and the general nature of his substance, exhibit A to exhibit Z. Here are three sentences from the March number of the *Smart Set,* 1922, and it is possible to know the author of them fairly well from only so much.

"The committee which awards the annual O. Henry prize for the worst fiction of the year seems to employ criteria that are even more astonishing; the stories that it selects are almost always hollow and artificial. It is true, of course, that an author of absolutely first-rate talent could not be imagined manufacturing such garbage, even for the great rewards that it brings. One simply could not think of a Conrad doing it, or a Hauptmann, or a Turgeniev, or a Hardy."

The sweeping assertiveness of this no doubt carries the uninitiated swinging along in its current. They have the romantic joy of an illusion that really does take possession of their minds as fully as if it were solid fact. Those with more literary experience will realize at once that Hardy's "A Pair of Blue Eyes," for instance, great artist though Hardy is, must be ranked a long way below the level of the stories chosen by this committee. It is only a blunderbuss sort of criticism that could make any other pronouncement. So it is with Hauptmann, and the judgment in this case is worse, because Hauptmann is not an artist in fiction of the rank of Hardy. It is not so much as believable that he could be the author of a short story of so fine a texture as either Margaret Prescott Montague's "England to America" or James Branch Cabell's "Porcelain Cups," both of them to be found in the initial volume, that for 1919.

One great trouble with America, one trouble with England, with the whole Anglo-Norman world, is that many of us are so gentle-minded that we yield blindly to strident volubility. This, to be sure, is not what Mr. Mencken discovers as being wrong with us, although he spends his energies very largely in tracking down our sins. He is not fitted to make the real discovery, which is, perhaps, that we have a naïve confidence that a man with a raucous voice will not expose himself as being irresponsible, knowing that his voice carries. He prefers to believe that such a man cannot have missed the truth. In some such fashion as this it is that we are deceived and betrayed.

At any rate, whatever the explanation, the Billy Sunday of current literary criticism, the swashbuckler of critical romance, has more followers than any honest appraiser of books with a modern mind can hope for. The ingénue intellectuals seem to admire him greatly, and they accept his charlatanry with a devotion that, for those of sentimental Teutonic ancestry, should be sufficient to bring tears of pitying tenderness to the eyes. Indeed, he appeals powerfully to all those who can see only broad distinctions, those whose limitations of vision compel them to believe that things must be intensely black or intensely white, that, whether gloves or saddle girths, they cannot be pearl gray.

Imposing on Us

FOR the realist who has been bred in the Anglo-Norman tradition and knows what it means, pitying tenderness is not in order. For him there is another feeling more appropriate. He sees very clearly that Mr. Mencken and his kind, a large coterie of the underbred and overfed, are attempting to impose on American life ideals and ends alien to it and destructive of almost everything that has made the alien wish to come here. For instance, Mr. Mencken's fellow editor of the *Smart Set,* in the issue for August, 1922, declares that he cares for nothing but himself, that the rest of the world may go to hell on the day of writing at sunset, as far as he is concerned, that, if he lived in England, he should be no more interested in the important problems of England than in those of America.

It is at this point, in the same issue of the *Smart Set,* under the caption, "Répétition Générale," contrived by Mr. Nathan and Mr. Mencken together, that I see for the first time, if I can trust my memory, a section "On Lying." In this the writer declares that, "One of the laudable by-products of the Freudian necromancy is the discovery that lying, in most cases, is involuntary and inevitable—that the liar can no more avoid it than he can avoid blinking his eyes when a light flashes or jumping when a bomb goes off behind him." It would be foolish to assume that this was written in any deep realization of its possible defensive value. At the same time it has that value. It is quite believable that Mr. Mencken does not know that life may be lived according to ideals other than those of a fat porker and still be interesting for presentation in literature. It is more than possible that he does not know that life may be rather a splendid affair.

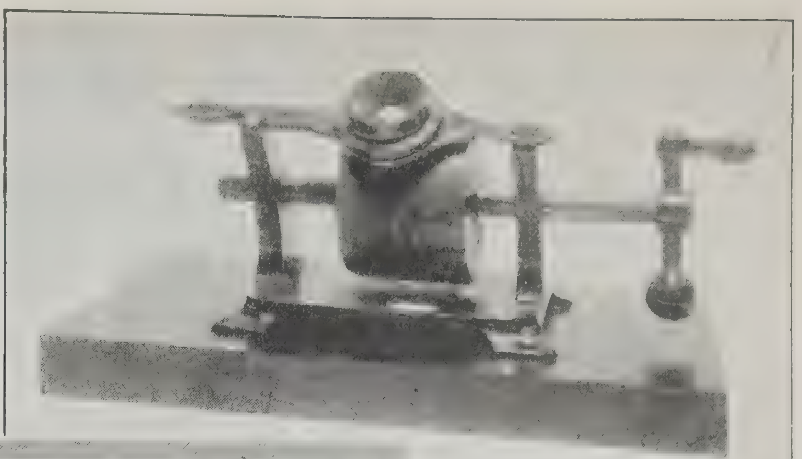
That way of looking at the matter—and at him—constitutes an explanation, at least. It makes it possible to see why he pushes off the literary map with so unhesitating a hand writers whose distinction in large measure is that their work is representative of American life. So it is that Hamlin Garland drops into obscurity, and Amy Lowell, and William Allen White, and Ernest Poole, and Vachell Lindsay, and others, unnumbered others. Greatness, for him, cannot coexist with any of the virtues, with delight in any of our finer human qualities, with allegiance to any of our constructive human idealisms, with recognition of any human motives not noticeably to be discovered among the debauchees of Continental Europe. Greatness, for him, is inconsistent with our civilization, because our civilization is not perfect—and woe be to him, in the books of Mencken, who tries to make it better progressively. Attempting anything of that sort is very much like being a puritan, and than that nothing could be worse.

It is one of the striking phenomena of our day that, as science has made our religion increasingly rational, religious romanticists have turned in the other direction toward Christian Science and similar cults. A corresponding development appears to have taken place in the world of art and letters. Literature, under the same influence of science and psychology, has taken the road toward a greater objectivity, a firmer realism. Romanticism and sentimentalism and emotionalism are all unhappy in that atmosphere. As a consequence, the left wing of the world of letters, to which Mr. Mencken belongs, reaching unconscious hands out to Mrs. Gene Stratton Porter, turns back upon the course and insists upon measuring everything in literature and life subjectively. This is quite natural and explicable. It is amazing that the reactionaries should take their little subjective world for the real world. In this matter the romanticism of Mr. Mencken and his fellows seems to be thoroughly sincere. They are telling their fairy tales to themselves, and, as far as their own credulity goes, they are doing it convincingly.

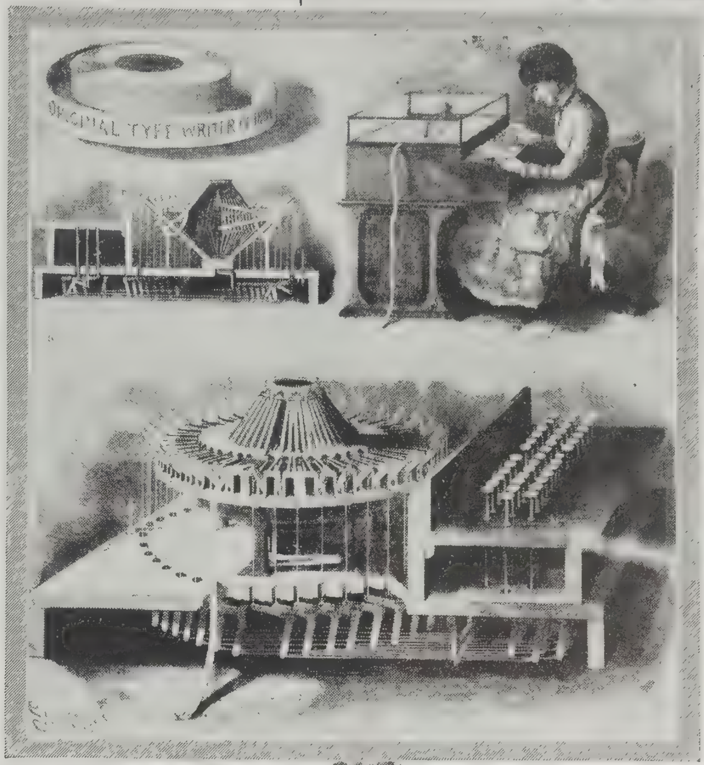
Beginnings: A Story on Inventions

Record Indicates That Gradual Development Marked Pioneering

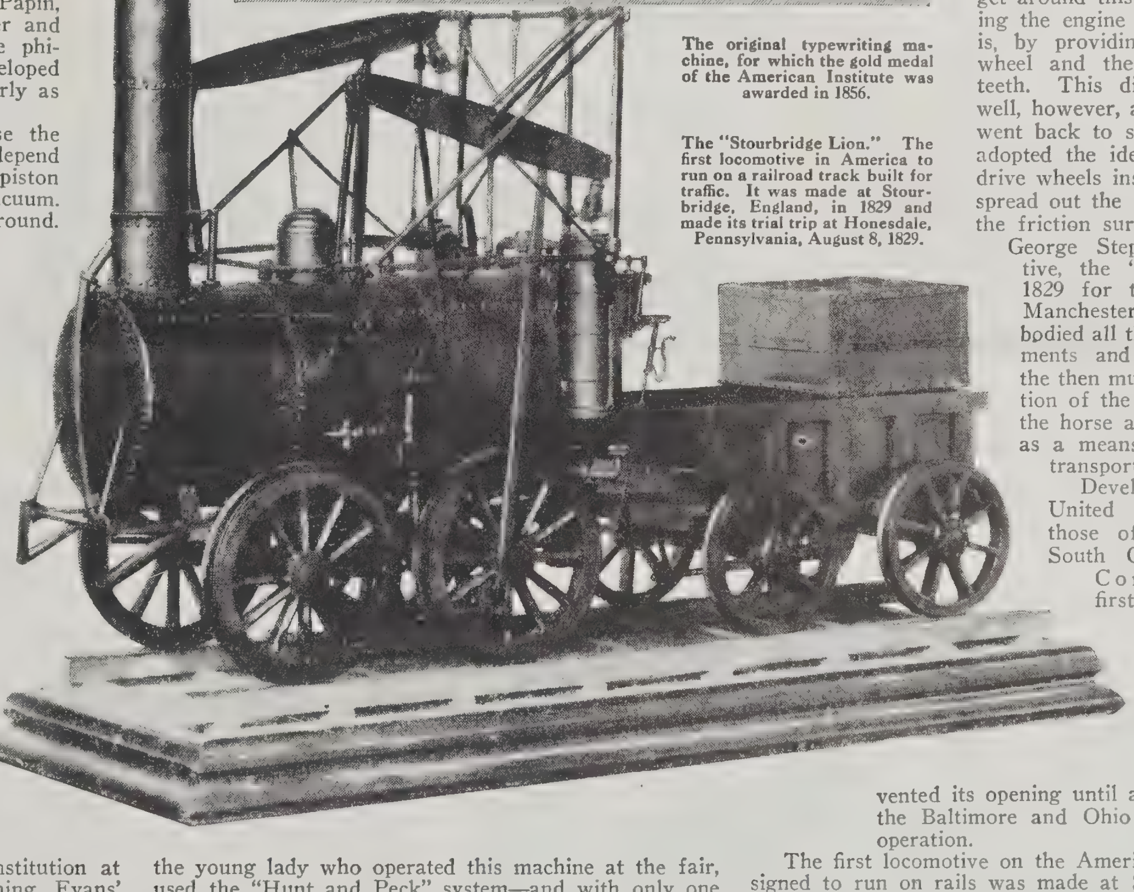
By O. M. KILE



Thomas A. Edison's first phonograph. Sheets of tinfoil were wrapped around the cylinder and the vibrations were scratched on this and temporarily recorded. One sheet of tinfoil could be used several times.



The original typewriting machine, for which the gold medal of the American Institute was awarded in 1856.



The "Stourbridge Lion." The first locomotive in America to run on a railroad track built for traffic. It was made at Stourbridge, England, in 1829 and made its trial trip at Honesdale, Pennsylvania, August 8, 1829.

AS WE glide along in a Pullman coach or a motor car, use our typewriters and telephones, or listen to grand opera on our phonographs, we are likely to take these wonders as an everyday matter of course.

It may make us appreciate these marvels more, or at least it should prove an interesting diversion, to give a thought to their origins.

Who invented the steam engine?

No, it wasn't James Watt, nor John Ericsson, nor Newcomen, nor Hornblower nor any of the rest whose names are ordinarily associated with this invention.

It was all combined, and hundreds more, who invented what we today know as the steam engine.

And so it is with practically all our modern contrivances. Few were created of nothing. Edison didn't just reach out into thin air and produce a new thing, the phonograph, new from beginning to end. He had forerunners and successors, each of whom did their bit. True, Mr. Edison's contribution was the most important principle, but it is possible that he would never have produced the phonograph if a Frenchman named Leon Scott, some twenty years before, had not developed a device similar to that of Mr. Edison, but intended only to record sound vibrations. Mr. Edison's great achievement consisted in turning this machine around and so constructing it that it would recreate sound from a record.

Similarly, James Watt in 1763 turned the steam cylinder of the engine around, inclosed it in a jacket, and did other things to it to make it more useful, very much more useful. But Denis Papin, of Blois, France, had invented the cylinder and piston seventy-three years before and the philosopher hero of Alexandria, Egypt, had developed a crude form of rotary steam engine as early as 50 A. D.

What Watt did, principally, was to use the *expansive* power of steam rather than to depend upon *atmospheric pressure* to move the piston after the condensed steam had created a vacuum. He literally turned the cylinder and piston around.

Through an accident which punctured the cylinder of an engine he was experimenting with, cold water was injected into the cylinder, and Newcomen had discovered the way to get a quick vacuum—an essential to the old air-pressure engine. The steam and injection valves of all engines were at first worked by hand, but the desire of a boy, Humphrey Potter, to play rather than operate the valves, inspired him to attach cords to the working parts of the engine and make the machine operate its own valves.

All this is in no wise intended to detract from the fame and glory of our inventors. It is intended rather to illustrate how hard won have been every one of our important advances and how many thousands, whose names we do not even know, have labored and toiled to bring forth our modern conveniences; conveniences which have today become necessities.

The first carriage to be self-propelled by means of an engine was constructed by Oliver Evans in Philadelphia in 1804. He called it the "Orukter Ampbiboles," whatever that means. It used steam power.

An old painting in the Smithsonian Institution at Washington shows a great crowd watching Evans' demonstration of the "ampbiboles" down in front of the old waterworks in Philadelphia. The machine looked something like an animated prairie schooner with the canvas cover off and wreathed in clouds of steam. The story back of the construction of this vehicle is thus:

Evans had constructed a steam dredging scow weighing 4,000 pounds. He found it heavy to move from the shop to the river, so he mounted it on wheels and geared it up in such a way as to make it self-propelling. It was a clever stunt and incidentally made Evans the father—or perhaps "grandfather" would be better—of the automobile.

Our modern typewriter has had an equally interesting history of development.

Previous to 1856, several crude devices had been constructed with the idea of making impressions of letters mechanically by pressing a key. But about 1856 Alfred Beach, of New York, brought out a machine that bears some resemblance to our present typewriters, although it was nearer the size of an old-fashioned organ than a modern typewriter. Furthermore, it could not make an ink impression. It merely embossed the letters on a tape.

This device was exhibited at the World's Fair at the "Crystal Palace" in New York in 1856 and attracted considerable attention. The inventor was awarded a gold medal. It will be noted from the illustration that the young lady who operated this machine at the fair, used the "Hunt and Peck" system—and with only one hand, at that.

This machine did, however, embody some of the key action principles still used in some types of modern typewriters, and with this start, improvement and development were fairly rapid.

Mr. Edison's first phonograph was merely a combination of a diaphragm bearing a stylus on the under side, and a cylinder on which was wrapped a sheet of ordinary tinfoil. When the cylinder was rotated, vibrations caused by the voice were engraved on the tinfoil. As noted above, this much had been done by Mr. Scott, some twenty years before, except that the markings were simply scratched on a smoked hard surface. Mr. Edison's device made impressions. So when he reversed the operation the stylus could follow these impressions and set up vibrations in the diaphragm, which produced sounds. The one machine would both record and reproduce.

The development through the various stages—first substituting wax cylinders for the tinfoil, then substituting discs and improving the stylus, the mechanism and the sound box—has been the work of many hands.

Because of its earlier development and its complexity, the locomotive has had, perhaps, the most interesting history of any of our modern machines. Mr. Carl Mitman, curator in the Smithsonian Institution at Washington, D. C., has gathered together a most interesting exhibit and description of the various early types. It is a far cry from Richard Trevithick's five-ton locomotive, which in its trial trip in Wales in 1804 drew a load of thirteen tons at a speed of about five miles an hour, to the modern Mogul engine, weighing ninety tons and capable of pulling a string of cars at a speed of seventy-five miles an hour.

Trevithick's locomotive was in itself successful, but it continually broke the angle-iron rails provided, and for the next twenty years inventors turned their attention to devising a locomotive heavy enough to stick to the track and develop traction, yet light enough to avoid excessive track breakage. In one form or another, this contest between track and locomotive has continued ever since.

One of the early types tried to get around this difficulty by gearing the engine to the track; that is, by providing both the drive wheel and the track with gear teeth. This did not work very well, however, and inventors soon went back to smooth wheels and adopted the idea of having four drive wheels instead of two. This spread out the load and increased the friction surface.

George Stephenson's locomotive, the "Rocket," built in 1829 for the Liverpool and Manchester Railway, embodied all the newer improvements and definitely settled the then much discussed question of the relative merits of the horse and the locomotive as a means of long-distance transportation.

Developments in the United States paralleled those of England. The South Carolina Railroad Company was the first in the world to decide that its railroad should be operated by steam locomotives. Its construction was begun in 1827, but delays prevented its opening until after a portion of the Baltimore and Ohio Railroad was in operation.

The first locomotive on the American continent designed to run on rails was made at Stourbridge, England, and brought to this country for the Delaware and Hudson Canal Company. It was called the "Stourbridge Lion." Locomotives in those days were so few and each so different from the others that they were named individually like boats.

It was a great day in American transportation annals when on August 8, 1829, Horatio Allen ran the "Stourbridge Lion" along the Delaware and Hudson Canal near the canal basin at Honesdale, Pennsylvania. A letter written by John Terry, of Honesdale, at the time, describes the "Lion" as running "with good speed around the curve and across the bridge and up the railroad about one and one-half miles to where the railroad was crossed by a common road-bridge placed too low to admit the passage of the locomotive under it. Here he reversed the engine and ran it back to the place of starting, greeted by the shouting cheers of the people and the booming of cannon."

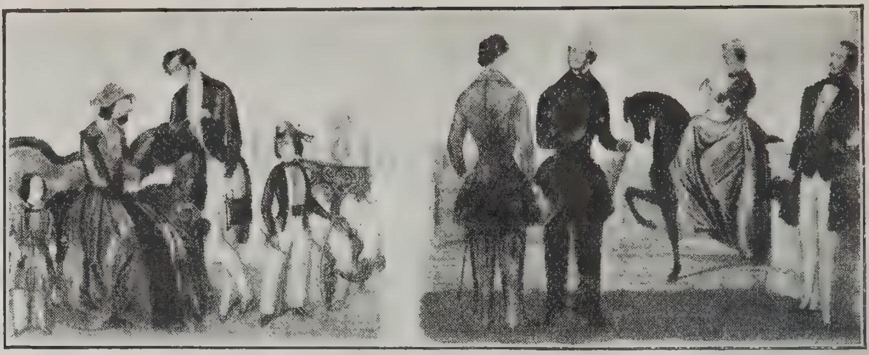
The first locomotive built in this country for actual service on a railroad was the "Best Friend," built at the West Point Foundry, in New York City, for the South Carolina Railroad.

It is interesting to note how the trend was first to four drive wheels, then for a number of years a single pair of drive wheels was the style, and, finally, the designers went back to the four-wheel drive idea.

In the opinion of many, the peak of efficiency has been passed. Engines spend too much time in the shops nowadays.

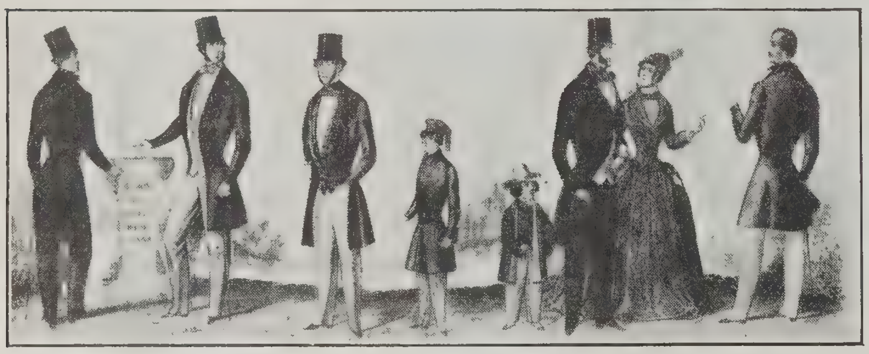
Changes a Century Has Wrought in Men's Styles

By E. I. FARRINGTON



Changing styles of the first quarter of the nineteenth century.

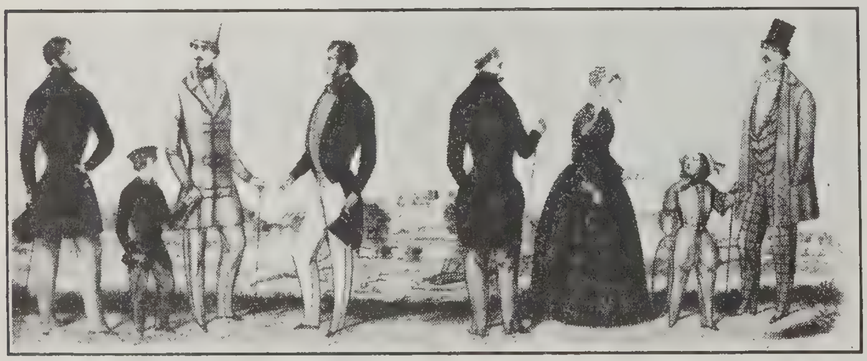
WHAT a wave of ridicule sweeps over the land when the style makers propose to array fashionable gentlemen in bright colored garments, especially for evening wear! It would seem that there is something sacred about the traditional black swallowtail. Yet a glance through the fashion plates of other days shows that the men of America have indulged in many sartorial vagaries. In the early years of the last century, for example, dress coats were made of bright blue material, being set off by cream-colored waistcoats and drab trousers, the latter having four buttons at the ankle.



Here we have the fashions prevailing in middle of the last century.

Those were the days when colors were almost as much in vogue in masculine garments as in those graced by femininity. Frock coats, light blue in color with a double row of buttons down the front, were considered to be in excellent form. The front of the skirt had the cut of a dress coat, but the tail became bell shaped, although with plenty of drapery. A garment of this kind was properly set off by green trousers which were very tight as far as the knees, but larger at the bottom, with straps under the shoes.

Perhaps the reason people in general fail to realize the tortuous course pursued by men's wearing apparel during the past century is because few fashion plates have survived the march of time. Tailors of the olden days had the habit of hiding their fashion plates from the public gaze, with the design, no doubt, of allowing their customers to understand that they themselves planned the clothing built in their shops. Only when they were alone in the security of the night watches would they take out these plates and copy the creations of New York designers. From year to year these plates would be destroyed, lest they fall into impious hands and cause aspersions to be cast upon the originality of the home tailoring establishments.

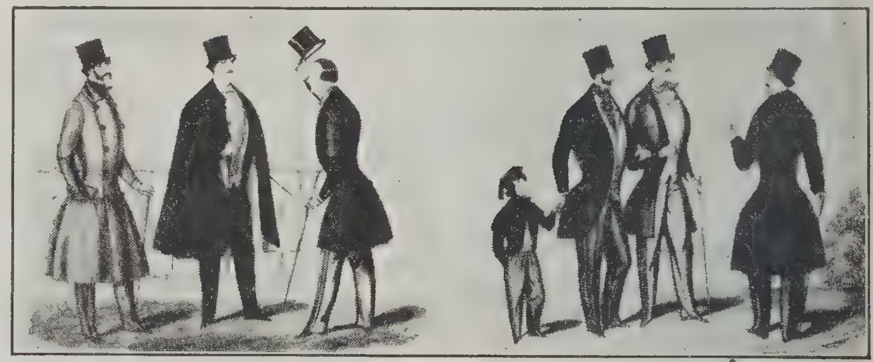


The late forties found these styles.

Probably the only collection which is anywhere near complete is that owned by Colonel F. W. Maynard, of Nashua, New Hampshire, a former state senator and a member of the governor's staff, as well as a successful tailor of high standing. Collecting these plates has been Colonel Maynard's pet hobby for many years. He has made long journeys and exercised much diplomacy to get possession of some of the old and rare specimens, dating back for nearly a hundred years. Not infrequently a picture has been rescued from the refuse heap, not always in perfect condition by any means, but still capable of being patched up to give an accurate representation of the styles which prevailed at the time it was made. From the year 1830 the files are complete and there are a few odd plates of earlier date, one of them being as old as 1810. The value of the collection is at least $10,000, and naturally it is kept in a safety deposit vault and well insured.

It is interesting to find by a study of these plates that in spite of several erratic and spectacular interruptions there has been a constant trend in the direction of comfortable and unpretentious men's wear. Drab and colorful periods have alternated, but plaids and checks have always been in style. Apparently there are only two years in all of these represented by Colonel Maynard's plates in which either one or the other does not appear. These particular years were 1872-3. If, as is to be assumed, the designers of those days made an effort to run checks and plaids out of fashion, they wholly failed, because the plates of 1874 show them once more high in favor.

In the early days of the republic men's garments must have equaled those of the women in the matter of color and trimmings. Apparently green was a fashionable color, for it was used constantly. It was a real Irish green, too, and not the restrained shade which is sometimes used at the present time. Cloth must have been cheap, for great quantities were used. The coats were broad and voluminous on the shoulders; the trousers were equally baggy and cloth consuming at the hips. Yet the prodigality in these respects may have been overcome by the exceedingly small waists and the close cut of the trousers below the knees. When the coats were buttoned they produced a curious hourglass effect, the skirts flaring until they equaled the shoulders in width, with the tightly pressed waist just halfway between. This bizarre combination of color and cut seems to have fastened itself upon the males of the day with great tenacity, remaining the vogue for several years. Bright colors and large trousers were seen not only at social functions but also on the streets and in business offices.

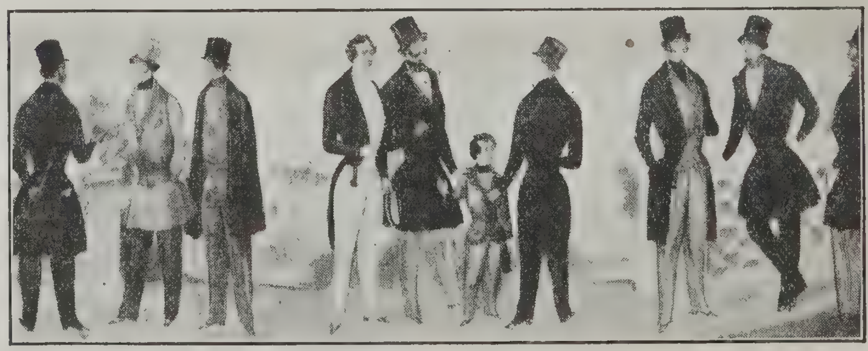


Tight waists and braided trousers of 1845.

During the next ten years the tailors of the land went on what was little less than a sartorial spree. They rioted in color both by day and by night. Evening clothes of light blue, green and brown prevailed. The broad collars were still retained, while the shoulders were padded so that they sloped at an angle of 45 degrees.

It was in the trousers, though, that real genius was displayed. Bold plaids were worn by the dandies, some of them of such enormous proportions that they suggested wall paper. It was at this time that trimming was introduced, running all the way from the ankles to the hips.

In 1848 the tailors evidently decided that if their patrons insisted upon having checked garments, they would give them something worth while. Accordingly they brought out patterns such as had never been seen before or are likely to be seen again. In Colonel Maynard's collection we find frock-coated gentlemen who must have looked like human checkerboards as they walked around the streets. Size was not the only point considered, either. There were marvelous combinations of colors. In one pattern of this time a tall and handsome man is found clothed in a black coat with trousers of robin's egg blue carrying black stripes to produce a sufficiently bizarre effect.



Fashions of the early forties.

Evidently this was the last despairing attempt on the part of tailors to head off a demand for less noisy clothing. In any event, the designs which appeared a few years later had become much quieter in tone. This is true, at least as applies to coats and trousers, but the tailors seem to have made a final stand on waistcoats, which still remained extremely colorful, one such waistcoat of clear pink being noticed under a black coat.

Apparently tailors always have been resourceful. When they found themselves curbed as to color, they began changing the cut of the garments they made. The trousers, or as they were more commonly called in that day, pants, seemed to offer special opportunities. They were allowed to appear in plain goods for the most part, but several inches of plaid or mixed material was attached to the bottom just above the foot, producing a curious cuff effect around the ankle.

It was about this time that the swallow-tailed coat came into being, and curiously enough the style then evolved has been retained with but few modifications until the present time. Evening clothes, however, as well as those for day wear, boasted a good measure of trimming, especially in the form of fancy braids sewed the full length of the seams.

It might be expected that the period of the Civil War would be one of drab and simple clothing, at least for men. Quite the contrary was true. There seemed to be, in fact, a renaissance of high colors for two or three years, brown coats, purple vests and French blue trousers being considered the attire of a well-dressed man, according to Colonel Maynard's plates.

One outcome of the war was the introduction of military capes for civilian wear. Nearly all the plates made for several years after the great conflict show old men and young men alike wearing heavy, voluminous capes, some of them reaching almost to the ground. Fortunately the trousers of the time were cut very much larger than in preceding years or a ludicrous contrast would have been produced.

Apparently the tailors were able to introduce only minor changes for the next few years, but in 1876 they hit upon the long overcoat as a successor to the cape. They were coats of immense proportions, and were featured at the Centennial Exposition, where thousands of well-dressed men were seen attired in these coats, mostly belted at the waist, and resembling, as Colonel Maynard says, a butcher's frock as much as anything. Incidentally, when these coats were thrown open a white vest was most likely to be seen underneath.

In the meantime men's hats had been going through an evolution no less marked. They were large enough in the first plates shown, but they kept growing bigger and bigger until 1840, when they had assumed enormous proportions. Not only were they very large, but they usually had peaked crowns and set well down over the ears. Probably all the men had been supplied with fashionable headgear of this kind by the year 1841, for then the peaked crowns were sent to the discard, being

(Concluded on page 11)

A Chance for Reciprocity With Canada

Importance of Pulp Wood One of the Favoring Arguments

By D. M. LEBOURDAIS

WITH a common boundary 4,000 miles in length, a great part of which consists of waterways jointly owned by the two countries; with passenger and freight trains crossing and recrossing that line daily; with populations speaking a common tongue, and with similar ideals and aspirations, it is surprising that there has not been much more inclination on the part of the people of Canada and the United States to negotiate some plan whereby their joint possession of this northern part of the North American Continent might result in the greatest degree of utility to all.

It is true that a convention has been maintained by which both nations have refrained from placing military or naval forces along that border, and this has been responsible in very large measure for more than a century of peace. In addition to this, there is the International Joint Commission, under whose jurisdiction common waterways have been placed. This body has demonstrated, in the short time since it was formed, that co-operation always pays.

In the realm of commerce, however, a great opportunity for reciprocal action is presented. Last year the total trade between the two countries amounted to almost a billion and a half dollars; yet it was, in spite of vexatious restrictions, imposed by both Canada and the United States. Each country subjects the exports of the other to high protective tariffs, the United States, by recent legislation, going much further than ever before to interfere with what should be a natural and easy exchange of commodities between the peoples of these two countries.

It is true that an offer of reciprocity in natural products was made by the United States in 1911 and very thoughtlessly rejected by the Canadian people; but the fact that both the Liberal and National Progressive parties have recently affirmed reciprocity planks in their respective platforms is an indication that reciprocity sentiment is on the increase in Canada. The phenomenal growth of the agrarian party in the past few years is a further indication of this.

The United States is fast approaching the day when she will no longer continue to be a food-exporting nation. On the other hand, it seems extremely unlikely that Canada will ever reach that stage. The Dominion possesses an overplus of natural products—with the exception of coal—in the two great provinces of Ontario and Quebec, which are dependent on mines in the United States, principally in Pennsylvania, for their supply.

From time to time many projects are advanced, seeking to provide for the distribution of Nova Scotia or Alberta coal in Ontario and Quebec, to make those great industrial provinces independent of the United States in this regard, but the question of transportation costs is such that they cannot seriously be entertained: it is much more logical to cross the lake and obtain the excellent coal of the Pennsylvania fields.

While at a pinch coal could be brought either from the East or the West to Ontario and Quebec, it is likely that they will always be dependent on the United States for the greater part of their coal.

There is another essential commodity, however, in regard to which the tables are more than reversed: United States publishers are becoming more and more dependent on Canadian forests for their supply of paper—either already manufactured, or in the form of pulp or pulp wood.

Every day in the United States 27,000,000 copies of daily newspapers are printed, and this number will increase with time rather than otherwise. Besides this, paper now enters into the manufacture of many articles which a few years ago were made of other materials, such as drinking cups, towels, table napkins, dishes and other articles of daily use. All this has caused a tremendous strain on the production of the paper mills, and they in turn have levied heavy toll on the forests of the country until the day is in sight when the forest wealth of the United States will be a thing of the past—unless some plan of general reforestation is adopted, of which at present there is little indication.

As early as thirty years ago United States paper manufacturers turned their eyes in the direction of Canadian forests, and large areas of timberlands were acquired in the provinces of Ontario, Quebec and New Brunswick.

Timber was cut from the Canadian limits and shipped to the mills in the United States to keep them supplied. Some United States manufacturers established pulp mills in Canada and shipped the pulp to be finished across the border; others established pulp and paper mills in Canada and exported the finished product.

The yearly income which these timber lease rentals provided was a very welcome additional source of revenue to the respective provincial treasuries. The time came, however, when unleased pulp lands in the better settled portions of the provinces became scarce and values began to increase. This resulted in an agitation on the part of Canadian mill owners for prohibition of pulp wood from leased government lands. It was conducted under the guise of conservation—the further claim being made that, by prohibition of exportation, United States manufacturers would be compelled to establish pulp mills in Canada. In consequence of this agitation, first the Province of Ontario, and later the other provinces, passed regulations forbidding exportation of pulp wood cut from leased government lands.

These regulations probably had the effect of establishing in Canada a number of mills, but it is not so certain that as great a number would not have been built without a resort being made to such stringent measures. The provinces of Ontario and Quebec are well supplied with excellent water powers in close proximity to their timberlands, and many authorities are agreed that Canada is destined one day to be the center of the world's paper industry. Tariffs and restrictions may operate for a time, but natural advantages are sure to prevail in the long run.

A stand of spruce at Green Lake, Saskatchewan.

The provinces were within their legal rights in placing embargoes on exportation of pulp wood, as all timber leases had been issued reserving to the government the right to make regulations from time to time concerning the method of exploitation; but, under the circumstances, it was hardly fair to attempt to force manufacturers, already owning mills in the United States, to build additional mills in Canada, or else be unable to utilize their timber leases. The mill owners had no other recourse than to submit. There was not much complaint until the great scarcity of paper in the spring of 1920 brought about the agitation instituted by Senator Underwood for the appointment of a committee, the purpose of which was to formulate some plan whereby certain retaliatory measures might be invoked against the Canadian people in an endeavor to force them to remove the restrictions against the exportation of pulp wood. This proposal was vetoed by President Wilson, and thus a possible occasion for the creation of ill feeling between the two countries was averted. A similar proposal emanated from the Harding Administration, but without the truculence of the proposed Underwood Commission, and it may achieve something.

Newspaper requirements in the Dominion are only fifteen per cent of the total Canadian production of paper; therefore the prosperity of the whole pulp and paper industry in Canada depends on the state of the export market. Such being the case, it would appear to be almost self-evident that the Canadian producer and the United States consumer are natural complementaries of one another.

During the fiscal year ended March 31, 1921, Canada produced more than $185,000,000 worth of pulp wood, pulp and paper. Of this amount, more than $150,000,000 worth was exported to the United States. More than two-thirds of all the news print used in the United States comes from Canada.

Canada has timber enough to last herself and the United States for generations to come if it be but properly conserved. There is no excuse for any dog-in-the-mangerism.

The late Senator Edwards, a prominent Ottawa valley lumberman, while chairman of the Canada Conservation Commission, made the statement that for every log cut by the lumberman twenty are destroyed by fire. In addition to this must be considered disease and decay.

It can be truthfully stated that a log converted into paper is a log saved, whereas if standing in the forest there is only one chance in twenty that it will not become a prey either to the flames or to one of the many deadly enemies to which the forests are ever subject.

This does not mean that there should be a policy of indiscriminate slashing—nothing is further from the thought; but it is intended to point out that intelligent exploitation is not the greatest evil with which the existence of the forest areas is confronted.

Trees grow. The land which has grown a tree once is quite capable of growing another, and it has been found that, under proper methods of reforestation, a considerably greater number of trees may be produced on the same land than under natural forest conditions; moreover in the natural forest trees require almost a century to reach a growth sufficient to be available for pulp wood, while under scientific forestry, a tree of similar dimensions may be produced in forty years. Tree culture is still in its infancy.

There are millions of acres yet in Canada where spruce timber grows almost as thickly as hair on a dog's back, and these millions of acres will never be suitable for anything but the growing of trees.

It is estimated that in the Province of Quebec there are about 155,000,000 cords of spruce and balsam available for pulp wood—sufficient to provide for about fifty-two years, at the present rate of cutting, which is 3,000,000 cords a year.

The annual growth in Quebec is placed at 5,000,000 cords; but this figure—as well as all other figures concerning Canadian timber resources—is only an estimate. The figures were supplied by the Canada Conservation Commission and are as accurate as the limited surveys will allow.

In Ontario, it is estimated that there are 100,000,000 cords standing, which would provide for sixty-seven years' supply at the present rate of cutting of 1,500,000 cords a year. The annual growth is estimated at 3,000,000 cords.

There are about 36,000,000 cords of spruce and balsam in New Brunswick; the annual cut is 1,250,000 cords; and the growth is estimated at about half that amount.

The Province of British Columbia possesses by far the greatest forest resources of any of the provinces, but estimates are not yet possible with any approximate degree of accuracy. The exploitation of forest resources in that province has hardly yet begun, but it is expected that in the near future it will contribute considerably to the total of Canada's pulp and paper production.

There are many reasons more potent than those expressed in terms of pulp and paper or of coal why Canadians and Americans should live and trade in amity one with the other; but this is a material age, and the arguments that appear to appeal most to the average person are dollars and cents. The foregoing is but one of many that might be adduced.

Changes a Century Has Wrought in Men's Styles

Concluded from page 10

succeeded by straight crowns and broad brims. This, of course, meant buying a new hat or else being disgracefully out of style. Now with smaller brims they began to grow larger in the top, until by 1848 the hats were wider at the crowns than at the brims. Bulky and imposing as they were, they must have been exceedingly uncomfortable to wear.

The tenaciousness of the tall hat in one form or another is remarkable. Nearly all the prints for half a century show hats that towered like stovepipes on the heads of fashionable gentlemen. There was a break in the year 1850, when caps suddenly became the rage. Then every man got a cap and wore it on occasion, but nevertheless kept his tall hat close at hand to be donned for all special functions, and particularly for his Sunday walk to church.

It was only after the war that the tall hat was really suppressed. The knock-out blow came when some ingenious hatter introduced the derby, a form of headgear which excited the risibility of the whole population at first, but which gradually caught the fancy of comfort-loving men, as its advantages of low crown, narrow brim and light weight became understood. Soon everybody was wearing a derby except judges, statesmen and a few other pompous individuals who felt that they would sacrifice their dignity if the tall hat should be abandoned. Then in much later years the soft hat became the derby's rival.

As appears in Colonel Maynard's plates, the tendency for the last half century has been altogether in the direction of quiet, loosely made garments. It is within the range of possibility that livelier colors will return to favor, and even perhaps knee breeches for evening wear; but that the male of the species will ever again clothe himself in such burdensome and uncomfortable habiliments as those his ancestors wore is beyond belief.

Scotch Farmers Find Thorns in Ownership

Old-time Renting System Now Seen to Have Decided Advantages

By VICTOR MITCHELL

IN SCOTLAND vacant farms are extremely rare, and as a rule there are not enough farms to go round. The Scottish farmer sticks to his homestead, and his children and his children's children follow his example. It is quite a common thing to find that the same families have occupied the same farms for hundreds of years, and apparently intend to remain on them as long as the world lasts. Take them as a class, they show many signs of prosperity and few signs of worry beyond those incidental to an unsettled season or a falling market.

The great majority of these agriculturists still rent their farms, although since the war an increasing number own their holdings. But these have found proprietorship by no means an unmixed blessing, for with high taxation, the obligation of making good all dilapidations and carrying out improvements, they find as a rule that they have let themselves in for what has been called an Irishman's bargain. Even before the war quite a number of the landed proprietors found that the increased cost of living, the higher wages of servants, the death duties and other Lloyd-Georgian taxation were cutting into their incomes to such an extent that they were willing to sell their good land on easy terms and to give away their bad land for next to nothing.

The Duke of Fife, after he had married one of the Royal princesses, unloaded thousands of acres of his land on anyone who was willing to buy, his sitting tenants receiving the preference. A good many took advantage of this opportunity of becoming owners, and did very well.

Then the war came and landlords and their sons took their part in the great struggle. Thousands of them laid down their lives and many infants became the proprietors of tens of thousands of acres out of which war taxation had taken the sap and the substance. But all landlords alike have been hard hit by the changes which have taken place, and some of them have lately been able to prove to the satisfaction of their tenants that far from making any money by drawing rents for their broad acres, their possessions have actually become a burden, with an adverse balance sheet at the end of the year.

Some of these proprietors, titled and otherwise, have turned themselves into limited liability companies after the manner of the Duke of Plaza Toro in the Gilbertian comic opera, and with decreased responsibilities have to be content with what meager dividends may be available.

As indicated, the tenant farmers who have become proprietors have been adversely affected by the same conditions, and some of them have come to the conclusion that in exchanging their rent-paying days, with their faint tinge of feudalism, for those of undiluted ownership, they have been led into a bad piece of business. Great reforms, altogether to the benefit of the tenant farmer, have taken place in Scotland within the memory of the present generation, and so long as he follows the methods of good husbandry he is entitled to security of tenure and a safeguarding of interests that amply protect him from the injustices and impositions of former times. For example, he does not need to worry about the wear and tear of his buildings, for if the landlord fails to make good a leaky roof, a cracked wall, or an insanitary dwelling, the tenant can seek redress in the land courts and almost invariably get it. The result is that farm buildings are kept in excellent order and the tenant need not be afraid of his rent being raised to pay for these improvements because fair rents are insisted upon by the courts, impartial experts being the arbiters in such matters. On the other hand, if a farmer wilfully neglects his holding by letting the weeds grow, by bad cultivation or by lack of fertilization, the landlord can bring him to book, and if he does not mend his ways can re-let the farm to an agriculturist with more advanced ideas, who is prepared to make the most of his land. The result of all this is better farming and a clearer understanding between landlord and tenant.

Among the larger proprietors who have disposed of thousands of acres since the war is the Marquis of Aberdeen, a former governor-general of Canada. Almost without exception Lord Aberdeen's tenants availed themselves of the opportunity of purchasing the farm they had occupied. The finest cattle in the country, if not in the world, is raised on this estate, for this is the home of the most famous herds of Shorthorns, and sires from these herds have for many years commanded record prices from breeders attending the sales from all over the world. Not only in Aberdeenshire but throughout Scotland farmers have attained a high reputation for the quality of their stock, and have made large sums of money thereby.

Sheep farming, both for wool and mutton, is also extensively carried on, particularly in the Highland districts where the uplands provide excellent pasture which is not suitable for cultivation. The wool fair held annually at Inverness is one of the big agricultural events of the season.

In spite of a falling off in prices since the war, and high freight rates, the Scottish farmer is, all things considered, very comfortably off. He has made himself acquainted with the most scientific and up-to-date methods of husbandry, and uses the latest appliances for the cultivation of the soil. In these days of high wages all labor-saving devices appeal to him, and in attending sales and markets in different parts of the country he saves much valuable time by driving in his motor car over the splendid roads by which every part of the country is intersected.

There is, of course, the usual exodus of younger sons leaving the farms to pursue their fortunes in the larger industrial centers, but these are only what may be called the natural surplus or overflow, and armed with a university course or a good training in some skilled handicraft, combined with a fair proportion of perseverance and level-headedness, their success is assured. At the same time, instances are by no means rare where, after the eldest son of the family has been provided for, by succeeding the father in the proprietorship or tenancy of the ancestral farm, the younger brothers have also been enabled to stay on the land by acquiring farms for themselves in a neighboring district. Only those who are crowded out in the natural course of things have to seek their fortunes abroad, bringing with them the best quality of brain and muscle where it is most required.

Canny Scots Look Askance at "Home Rule" for Scotland

TODAY there is an impression in the minds of many people that Scotland is intensely radical; but this is a mistake. The Scottish people have always stood for reform, but with their usual caution they have at the same time closely scrutinized any proposed changes before proceeding with them. It has been truly said that the great mass of the people were not in favor of the Act of Union passed in the reign of Queen Anne which brought about the fusion of their parliament with that of England. When this union took place the nation undoubtedly lost many of its ancient rights and privileges, and it is now maintained that Scottish measures frequently receive scant courtesy in the parliament house at Westminster, and that much delay and expense are thereby incurred.

It is hard to believe that in this age of self-determination, so-called, and the rights of small nations, that the secretary for Scotland is below the status of a minister and has no seat in the cabinet, and that the Scottish Office is a shabby little bureau situated in Whitehall which has nothing Scottish about it except the name.

Although it has often been asserted that Scotland is governed from Whitehall, on the other hand it is declared that Westminster is controlled from Scotland. There is no doubt that for many years Scotsmen have taken a prominent part in the affairs of the Empire. Bonar Law, although born in Canada, is of Scottish blood; Lord Balfour comes of a Scottish family; the great Gladstone was of Scottish extraction; Rosebery, that light of other days, claims the same descent, and Ramsay Macdonald, the present leader of His Majesty's Opposition, is a Morayshire man. But although all these men and others like them have in a certain sense done great things, there is a feeling that Scotland has been sidetracked on many occasions, and that she does not receive a just share of her own revenue.

The burden of taxation now falls very heavily upon the people, and this combined with bad housing conditions has been the cause of a considerable amount of discontent. There is a widespread feeling that the country is not receiving a square deal and the muddle that the present government has made of the housing question and of the unemployment problem has provided a slogan for the "wild men" from Glasgow who have been making themselves heard from the Opposition benches for the past few months. It seems hard to make an Englishman understand that owing to local conditions the great majority of the houses in Scotland are built of stone, not of brick, as most of them are in England, and that stone costs more than brick or wood.

The question is frequently asked whether there is any great demand for Home Rule in Scotland as a panacea for all its troubles; the reply, as they say at question time in Parliament, is in the negative. There are, as a matter of fact, a number of Home Rule organizations in the country, and have been for many years, and there are a number of Scottish members of Parliament who at election time pledged themselves to support any measure of self-government that happened to be brought up, but generally speaking the question is not taken seriously. Last summer the subject was brought up in the House of Commons and failed to arouse more than a passing flutter of interest. There was almost an empty House, Scottish members being conspicuous by their absence, and instead of supporting the matter, some of the members cast ridicule on the whole business, and the bill was "talked out" without anything being done.

It would doubtless be a fine thing for Edinburgh to have its parliament buildings once more throbbing with legislative life and to be reinvested with all the dignity that properly belongs to the ancient Scottish capital, but parliaments cost money and at this hour of the day the average Scotsman is apt to think twice before he pledges himself to support what might turn out to be a very costly experiment.

There is another party of enthusiasts in Scotland whose aspirations go beyond Home Rule and will not be satisfied with less than complete independence—"freedom" they call it—and although they carry on an active propaganda, not much of it reaches the man in the street. Their program includes the restoration of the Gaelic language, and the re-dividing of the country into its ancient Celtic provinces of Moray, Mar, the Lothians, and so forth. But the people are no more prepared for this than they are for the restoration of the old clan system with the Highland chiefs in all their pristine splendor. No De Valera has yet arisen to make bombastic speeches for hectic consumption, and the Scottish people have no use for such adventurers. The clan system was forever settled at Culloden Moor, and the descendants of the men who fought there have ever since been loyal sons of the Empire and have shed much good blood in its service, but it must be admitted that for this they have sometimes received scant recognition.

What the Scottish people desire is not the reopening of an old parliament in Edinburgh for the manufacture of new laws, but the reform and regeneration of the laws that already exist. They are proud of their country and are not in the least afraid that its identity or that of its people will be absorbed by England. They stand as firmly by their traditions as Edinburgh Castle rests upon its rock, and as alertly as Stirling towers look forth upon the field of Bannockburn.

"Bill" Gordon Is No Longer a Robinson Crusoe

Concluded from page 3

With three or four officials, notably A. W. Tupper, assistant engineer, having the foresight, initiative, and engineering ability, an organization was formed to stimulate interest in the "wonders of the wireless waves." The keepers, about fifty all told, have already responded and their desolation has been transformed into opportunities for listening to speech, music, weather reports, and sundry other information, both instructive and entertaining. The Radio Club of the Bureau of Lighthouses in Washington, in the interest of the advancement of this science and as a means of dispelling the loneliness of the lighthouse, has designed a radio-telephone receiving set which can be constructed at a cost of twenty dollars. Blue prints of the structural details of this miniature electron-tube receiving outfit are to be made available to keepers of lighthouses, and it is not visionary to assume that ultimately every guardian at these approximately 500 "beacons to navigation" will install wireless facilities.

While lighthouses or stations—headquarters of keepers—are not ordinarily provided with wireless facilities, unless installed at the expense of the keeper, about thirty tenders in the service of the Bureau of Lighthouses are equipped with both radio-telegraph transmitting and receiving sets. These tenders or seagoing vessels serve the purposes of distributing food and supplies to lighthouses and light vessels. The distinction between a lighthouse or station and a light vessel is that the former is commonly located on shore or not far removed from land, whereas, the latter takes the form of a ship and is a fixed guide for navigators at some point in the ocean or other body of water. Commissioner George R. Putnam, of the Bureau of Lighthouses, describes light vessels as "the outermost signal stations of the country, many of them being anchored in the open sea, miles off the coast."

The 29 seagoing tenders not only distribute supplies to the lighthouses and light-vessel stations, but they keep the buoys and lights in order and may report distress signals. The application of radio telegraphy on tenders may result in an economy of the movements of these vessels. For instance, recently on the coast of Maine, the keeper of a light station reported to the district office by telephone that a big can buoy had broken away from its moorings and was adrift. A wireless message was dispatched to a tender that was operating in that vicinity, with the result that the drifting buoy was restored to its station before sunset. Our shipping interests, thanks to that speedy vehicle of intelligence, were thus safeguarded by the prompt replacement of the buoy, and useless steaming of the tender was avoided. Seagoing tenders are equipped with spark sets, varying from one-half to two kilowatts in electric power, and they operate on a wave-length ranging between 300 and 952 meters. Located at strategical points along the Pacific and Atlantic and Gulf of Mexico coasts—the service of the Bureau of Lighthouses embracing 44,000 miles of coast lines — these tenders quickly respond to any distress signals. The Department of Commerce, in recognition of the popularity of radio-telephone broadcasting, recently authorized several of these tenders to make such small accessions to their wireless facilities that the programs of the powerful transmitting stations could be received. Consequently, a "loud-speaking" device and other additions have been included on board these vessels, thereby enabling the crew to derive benefits and share the pleasures of the informative and entertaining qualities of broadcasting services.

Light vessels—aids to navigation that might be described as floating lighthouses but for the fact that they are anchored in the open sea or maintained at fixed points in remote localities—are equipped with wireless apparatus for both the transmission and reception of communications. All told, twenty-three of these vessels are provided with sending and receiving sets.

The Bradstreets and Their Splendid Legacy

Hardships of Life in First Days Too Great a Tax Upon Gentle Anne

By MAY B. WHITING

EVERY once in a while some inquisitive soul traces the history of a notorious criminal and his offspring and then frightens us with a tale of the tenacity of evil, but one rarely records in definite terms the influence of good. Take, for example, the Bradstreet family. No one served the colony more honorably than Governor Simon Bradstreet, no woman of her time was of more lovely character or more intellectual than Anne, and yet, for this generation, the meaning of their life seems almost lost. But just a little of that research so willingly bestowed on crime would show us that virtue has more power than evil to perpetuate itself.

The good ship *Arbella* that came over in 1630 brought many notable passengers, among them Thomas Dudley and his daughter Anne, wife of Simon Bradstreet. Bradstreet was a man of culture and of means and set about building himself a good house in Cambridge and embellishing it as well as the scanty resources of the colony would allow. The General Court called him to task for using wainscoting, but finally accepted his explanation that it was not wholly a luxury but served to keep out the cold.

Anne had been brought up in all the refinement of an English castle and while she did not, like the gentle Lady Arbella, for whom the ship was named, droop and die, the hardships of the new life were a sore tax upon her health. She was a beautiful type of Puritan womanhood, gentle, devoted to family, and of vigorous thought. Of course she had a conscience. "As I grew up to be about 15 or 16," she confesses, "I found my heart more carnal and sitting loose from God. Vanity and the follies of youth took hold of me." It was not without a struggle that her "carnal" mind conformed to the strict Puritan model. "I found a new world, and new manners," she writes, "at which my heart rose, but after I was convinced it was ye will of God, I submitted to it and joined ye church at Boston."

We almost wish she hadn't! So much of that early life would have been spicy reading if there had been an outsider to record it. But the Puritan was too much in earnest, the odds against him too overwhelming for him to see anything picturesque in the daily struggle. Every Thursday evening the men assembled to discuss the sermon of the previous Sunday and Anne was doubtless one of the 70 or 80 women whom Mistress Hutchinson invited for similar instruction, thereby scandalizing the deacons and later setting the whole town by the ears.

In 1634 it was considered desirable to build up the inland settlements and the Dudleys and the Bradstreets removed to Ipswich, then called by its Indian name of Agawam. Here life was infinitely harder than in Boston. And yet there were learned men in Agawam, and, in spite of the terrors of the wilderness and the constant fear of attacks from Indians, there were vain women whose doings upset the public mind as completely as the flapper does today. Nathaniel Ward, the minister, calls them "the very gizzard of a trifle, the product of a quarter of a cipher, the epitome of nothing." It seems as if veils must have been the especial abomination for he continues in these crushing words, "It is no marvel that they wear tails on the hinder part of their head; having nothing it seems in the forepart but a few squirrels' brains."

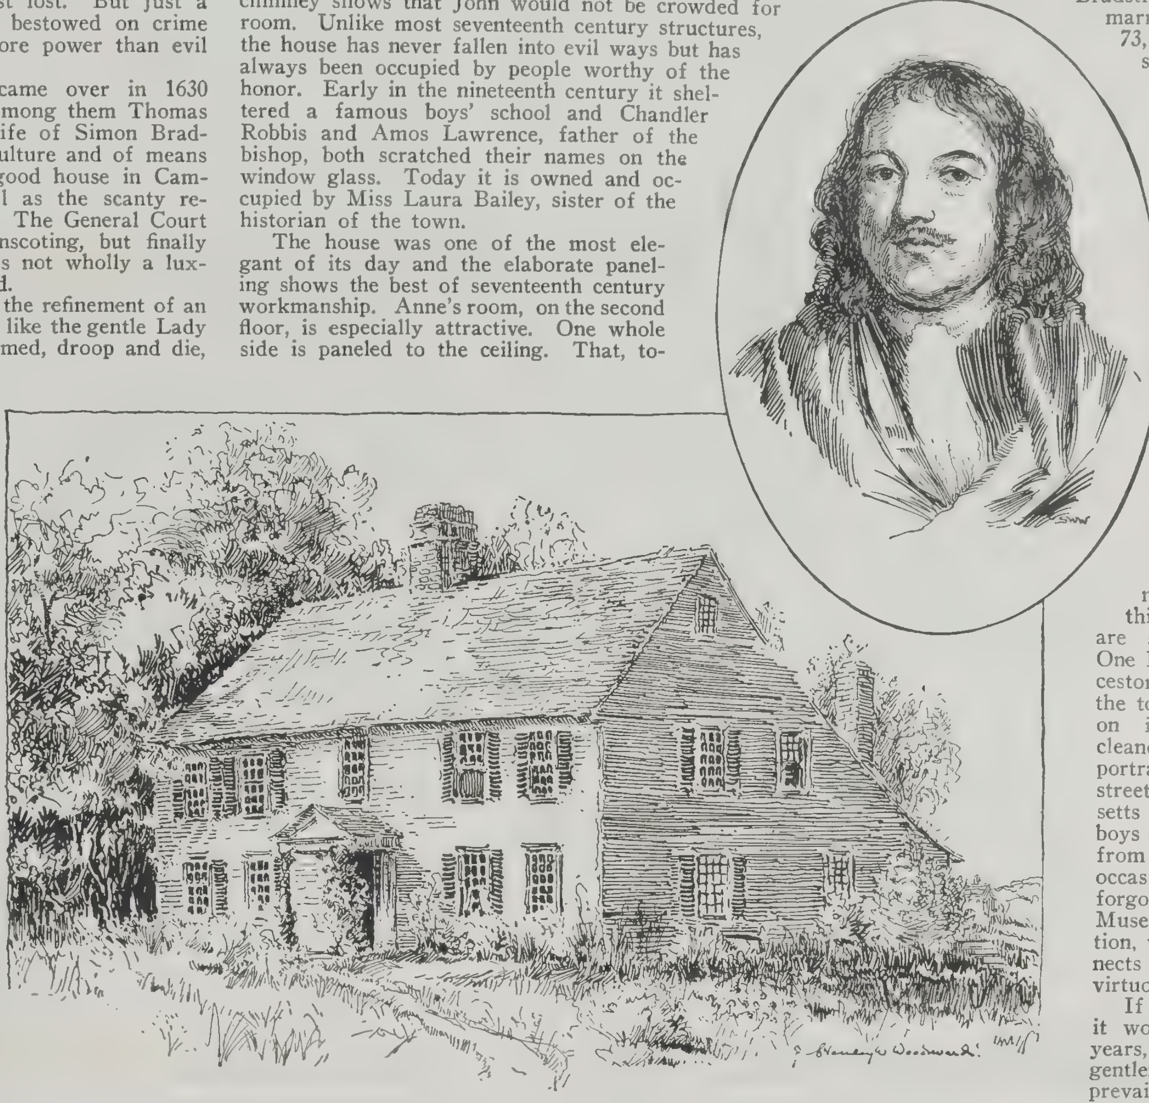
Not that Anne was one of those vain ladies, for her nature was too modest and her tastes too studious. It was in Agawam that she did the most of her writing. Both husband and father were away frequently on business of the plantation and Anne turned to poetry as a relief from the loneliness of life. When her brother-in-law, John Woodbridge, made a trip to England he took along a copy of her poems and there, without her knowledge, they were published under the title, "The Tenth Muse Lately Sprung Up in America."

To our ancestors, accustomed to the fearful jargon of the Bay Psalm Book, Anne's verses seemed the acme of wit and grace. The president of Harvard declared that "twice drinking the nectar of her lines" left him "weltering in delight," but a modern reader would hardly be enthusiastic at the prospect of a rhymed history of the ancient monarchies, a description of the four seasons, and a Dialogue between Old England and New.

In 1644 the Bradstreets moved still farther into the wilderness, in Andover. Here, with the cares of her growing family, Anne had little opportunity for literary work. The old records show us that the servant problem was acute in Andover. A minister feelingly writes, "I had a rare blessing of servants in Yorkshire but this younger brood doth much afflict me." Slaves were not uncommon and frequently the distracted housewife was driven to use Indian help, fresh from the wigwam. The Bradstreets had a particularly pestilent servant, John, prone to steal "a great fatt Pig" and roast it in the woods, throwing the remains "to the dogges." On one occasion "2 or 3 fellowes" let him down the chimney to get "strong beare."

The Bradstreet House, in what is now North Andover, is still standing and one glance at its clustered chimney shows that John would not be crowded for room. Unlike most seventeenth century structures, the house has never fallen into evil ways but has always been occupied by people worthy of the honor. Early in the nineteenth century it sheltered a famous boys' school and Chandler Robbis and Amos Lawrence, father of the bishop, both scratched their names on the window glass. Today it is owned and occupied by Miss Laura Bailey, sister of the historian of the town.

The house was one of the most elegant of its day and the elaborate paneling shows the best of seventeenth century workmanship. Anne's room, on the second floor, is especially attractive. One whole side is paneled to the ceiling. That, together with the quaint fireplace, the narrow panes of thick glass brought from England, the eleven sloping beams that run up through it, give a particularly antique, yet cheery air.



GOVERNOR SIMON BRADSTREET and the Bradstreet House in North Andover.

Simon Bradstreet was the prototype of the New England "good provider" and loved to furnish his family with every comfort that colonial life afforded. No doubt when the Puritan aristocracy, the Winthrops, the Dudleys, the presidents of Harvard College, were their guests, there was much display of ruff, gold lace, brocades and buckles.

But Anne did not live long to enjoy the new home. The years of pioneer life had been too great a strain and she passed away in 1672. Simon Bradstreet, four years later, married again at the age of 73, and for almost 20 years served the colony as deputy governor and governor. When nearly 90, he was the first signer of what Bancroft calls a "sort of first Declaration of Independence," calling for revolt against the misrule of Andros.

There are few memorials of the Bradstreet family, not even a record of their graves. Anne probably lies in the old Burying Ground at North Andover and her stone has crumbled to dust. Simon Bradstreet was buried in the Charter Street Cemetery in Salem where his monument is standing to this day, although his ashes are scattered to the winds. One Daniel Hawthorne, an ancestor of the novelist, claimed the tomb for some repairs done on it, and unceremoniously cleaned out its contents. A portrait of Governor Bradstreet hangs in the Massachusetts Senate Chamber, school boys con a few lines about him from their histories, and an occasional antiquary reads the forgotten lines of the Tenth Muse. But for this generation, where is the link that connects our life with that of this virtuous couple?

If the old house could speak it would tell how, for many years, the broadmindedness and gentleness of its first occupants prevailed for good. The homestead descended to a younger son, Dudley Bradstreet, a man whose influence was largely responsible for the cessation of the witchcraft frenzy.

Mercy, daughter of the oldest son, Samuel, married Dr. James Oliver, and from her are descended Oliver Wendell Holmes and Wendell Phillips. From the daughter Lucy who married Jonathan Remington are descended William Ellery Channing and the Danas.

On the Trail of Our "Rock Shelter" People

Concluded from page 2

their food supply, they gathered up a few objects, trudged over the Ozark hills to the good doctor's home, and found in him an eager purchaser. And they builded better than they knew, for one of the specimens was a stone axe—*with the original wooden handle attached!*

The doctor, finding himself, with the addition of these "Rock Shelter" specimens, in possession of more archeological material than he could conveniently take care of, now opened negotiations with the Museum of the American Indian, Heye Foundation, New York City, and eventually sold his entire collection, containing several specimens of prehistoric culture, to this scientific body. That, however, was merely the beginning of the story.

After a careful comparison with both older and more modern cultures, the museum scientists concluded that fate had delivered into their hands several archeological specimens far out of the ordinary. Here, then, was a clue worth following up; it would be worth a trip of a thousand miles and a summer's work in the stifling rock shelters and caves of the Ozarks to add even a small chapter to the world's scanty knowledge of the American Indian.

In the spring of 1922, therefore, Harrington and Cadzow outfitted themselves with a camping outfit and a canoe. Proceeding by train and motor truck to a point on the White River in Northwestern Arkansas, they launched their canoe and began the "still hunt" for the bluff dwellers' community sites. Poling their way slowly up the swift waters of the White, the scientists found what seemed to them to be an ideal location. For thousands of years the natural forces of erosion had worn away the lower layers of limestone along the banks of the stream. Underneath the overhanging wall of rock, from the outer edge to the back wall of the bluff, they were in many cases fifty feet deep, and the practically continuous ceiling ranged from ten to fifty feet in height, growing higher as one continued downstream. In these thousands of years the river has cut a gorge for itself, so that the rock shelters are now some seventy-five feet above the present surface of the stream.

The largest community site found by Harrington and Cadzow was at a place called Salts Bluff. This must have been the "Main Street" of the bluff dwellers, for there was only one slight break in its continuous shelter of approximately five miles. A thousand families could have lived in this stupendous shelter. Situated at a bend in the river, the surface of which was visible for miles, its strategic position could not be improved upon. The floor for the greater part of its length was as dry as powder. Apparently not a drop of rain had ever leaked through the limestone "roof." So dusty were the floors that the archeologists were compelled to wear a sort of gas mask, a "respirator."

A careful checking up of these discoveries in the creek beds, in the valley, and in the rock shelters indicates that there were three separate and distinct peoples living on or near the banks of the White River during periods perhaps hundreds of years apart. Crude and water-worn chipped implements found in the beds of tributaries of the White are evidence of a culture hundreds of years older than that of the "Rock Shelter" people. With the habitual caution of scientists, however, Harrington and Cadzow estimate that these "stone-age" people lived in the White Valley about twenty-five hundred years ago. Others, while they cannot be positive, admit that these people might possibly have lived there thirty-five hundred years ago, or in the days of Tutankhamen! The "Rock Shelter" people themselves are thought to have lived from fifteen hundred to two thousand years ago, but the very scientists who furnish this conservative estimate admit that these bluff dwellers might just as easily have inhabited these natural caves three thousand years ago. But as scientists they prefer to err, if at all, on the side of conservatism.

Uncle Sam, With Films, Teaches Farm Truths

Department of Agriculture Equipped With Elaborate Studio

THE only government-operated motion-picture-producing and film-distributing laboratory in the world was recently dedicated in Washington, D. C. The United States Department of Agriculture, in its efforts to present scientific agricultural truths by means of the screen, has reserved a new, fireproof, brick building for the use of the Motion Picture Division. This structure occupies 10,000 square feet of floor space. With the complete laboratory furnished, the department is the first government agency to engage in the manufacture and distribution of motion picture films on an extensive scale.

Fred W. Perkins, in charge of the division, has directed this line of educational activity for Uncle Sam during a period of years and has fostered its development from a "one-camera idea," a side line to publicity, to its present expansion into a full-fledged project. Mr. Perkins was formerly attached to the press service of the Division of Publications, United States Department of Agriculture, and antedating that connection he was engaged in newspaper and magazine writing. Like some other members of the craft, he has the happy faculty of clothing drab scientific subjects with entertaining qualities.

Staging a "movie" in the studio of the new motion picture laboratory of the United States Department of Agriculture.

If a visitor makes an excursion through the laboratory, he or she will have observed the various stages and processes entering into this kind of photography. Other than the well-lighted and ventilated studio atop the building, there are reservations for making titles to the pictures, developing, drying and assembling the scenes. There is a staining room, where the film is given a particular color, as the scene may suggest. For instance, a moonlight portrayal is effected by a blue stain, while a forest fire takes on a brilliant red hue. The workers in both the printing and developing rooms perform their duties under the reflection of red lights. The drying room is quarters wherein the films are wound around revolving drums and dried. The assembling room is where the films are inspected, cleaned, and handled. Six film vaults, each having a capacity of 1,026 reels of 1,000 feet of film, are reserved for storing the motion picture productions.

The projection booth and projection room are immediately at the rear of the offices of the motion picture building. Here the films, designed to carry the lessons of improved agricultural practices to approximately 30,000,000 farming folk, are flashed on the screen for official inspection. For instance, while this writer was spending an afternoon exploring, there came over the telephone a request to Mr. Perkins from a woman worker in the extension field requesting exhibitions of the films pertaining to the manufacture of Roquefort cheese and Swiss cheese in America. A foreign nation had requested a loan of these films. Hardly had this demonstration been completed before a telephone call came from the Bureau of Entomology asking the privilege of seeing the picture entitled, "Fighting Western Pine Beetle."

This is a pictorial story describing the destructive tactics employed by an insect in making waste of the pine timber in the Pacific Coast states and methods for controlling the activities of this beetle.

The new motion picture laboratory is likely to be the assembling point of scientific societies and other organizations interested in the production and distribution of agricultural information. Only recently, the agricultural editors, in session in Washington, gathered in this workshop to witness the methods of Uncle Sam in sending his gospel of better farming to the uttermost corners of the nation through the eyes of the motion picture camera.

The White House Photographers' Association, a local organization of camera men who make a million, more or less, pictures of the President, and "snap" the celebrities visiting the White House, is to hold a session in this motion picture laboratory. It is also to serve as a rendezvous for occasional meetings of the chiefs of the respective bureaus of the Department of Agriculture, and from time to time scientific organizations will study the ways whereby Uncle Sam is using the camera to teach agricultural truths.

These uses, however, are only incidental to the major purpose of this motion picture laboratory, namely, the production and distribution of films for displaying on screens in rural communities. These educational pictures are designed to serve the needs of the farmer on a diversity of subjects, as typified in a testimonial from L. L. Heller, of the Cook County Farm Bureau, in Illinois, when he wrote: "You will get more farmers interested in better farming through motion pictures than in any other way. After they have seen the government's film on the control of hog cholera there is little danger that they will not know the disease when they see it, and take the necessary control measures. The importance of disposing of the carcasses is pictured in their brain by the lights and shadows of the screen."

In the case of a film designed to impress upon farmers the necessity of eradicating cattle ticks, there is the bit of impressive testimony from an agricultural representative in Texas, when he writes: "Have seated as many as one hundred children on the floor—close to the screen, with every window and door crowded full of men and boys like bees around a hive, and women standing for an hour and a quarter with babies in their arms, and not a murmur because of their discomfort, and not a soul would leave the room until the show was over."

"Exit Ascaris," strange title that it is, in reality is a label on a government film describing methods for ridding hogs of the roundworm, a destructive internal parasite. "We would certainly like to see the film shown to every hog-raiser in the country," says the National Swine Growers Association. "Out of the Shadows" is the title of a motion picture production that warns of the danger of tuberculosis among cows with respect to the possibility of this bovine disease being transmitted to human beings that drink milk from infected animals.

The Motion Picture Division, with its personnel of seventeen and with six cameras in use, has already made excursions into every state. In its search for accurate and complete details on more than one hundred subjects, the motion picture photographer goes afield constantly. For instance, during a single trip recently the photographic party crossed the backbone of the Rocky Mountains, and visualized for exhibition on the screen a forest fire 12,000 feet above sea level. From this commanding elevation, the motion picture photographer traveled to California, where pictures of date culture were taken at a descending point 2,000 feet below sea level. This trip afield included a number of airplane flights, from which vantage points the photographer could better visualize the objects sought.

Uncle Sam's collection of motion pictures now includes 160 films. For about a decade the United States Department of Agriculture, through its Division of Publications, has in a modest way recognized the value of the screen as a medium upon which to display the fruits of research. Not until recently, however, has this government department placed its stamp of approval upon this method of disseminating information in an elaborate fashion.

The subjects filmed by Uncle Sam run the gamut of agriculture. The range of farming topics extends from reels indicating methods of controlling roundworms in pigs to a film describing methods of building concrete roads. The titles are catchy; purposely alluring as a means of "sugar-coating" subjects that are frequently uninviting.

Legends of Lovely Isle Royal Find Origin With Indians

Concluded from page 6

found copper in abundance. Minong in Indian parlance meant the "good place to find copper."

All the explorers from Radisson to Alexander Henry seem to have been impressed with the riches of "Minong," as Isle Royal began to be called. Indeed it is quite evident that Benjamin Franklin and the other commissioners representing the United States of America who negotiated the treaty of peace with Great Britain had in mind the mineral resources of Isle Royal when they stipulated that the northern boundary line should pass through the middle of the Great Lakes and north of Isle Royal—thus including this interesting island within the territory of the United States. Nothing, however, was done to determine the extent of these reputed mineral deposits until some time later.

The Indian traditions of fabulous copper deposits filtered down through the two centuries that followed Radisson's discovery of the island, losing nothing but rather gaining color from the imagination of the voyagers who covered the waters of the Northwest with their canoes in search of furs and fame. Nothing definite was done, however, until just before the middle of the last century—then the work began. It was a period of great mining excitement. The forty-niners were crossing the continent to reach the gold fields of California. It was remembered that there was copper to be had for the mining in and about Lake Superior. Companies were accordingly formed backed by large capital to exploit the riches of this "north sea."

Docks and lighthouses were built along the sheltered coves of Isle Royal, shafts were sunk and mining villages sprang up to house the growing population. Copper had been discovered on Keweenaw Point and iron at Marquette on the Gogebic range. All went swimmingly for a time—then came the crash of 1857 and the bubble burst.

The ambitious villages have long since gone to ruin. The storms of three-fourths of a century have left little above the surface, and time is fast filling the abandoned shafts. He who cares to explore the island may find among the wild roses of the open glades and the second growth of white birch on the hillside the bleached and broken headstones that mark the graves of these hopes that were.

On little Siskowit Bay you may find, if you look well, the ruins of an old dock. Two miles back from this may still be found traces of the "Island Mine"—a few crumbling foundations and the mouth of a shaft. Here was once a village with a church, a schoolhouse, a post office and the clustered buildings of a mine that gave life to six hundred souls. The place is silent now. The scars made by the road on the hillside are all but healed with a covering of briers and wild flowers and where the streets once were white birches gleam in the sunshine.

Guarding the entrance to Rock Harbor stands an abandoned lighthouse. Its lanterns are empty now. But seventy years ago they lighted the way to a scene of unusual interest, for back of the hill slope were located the "Douglas" and "Harbor" mines—the former named for Stephen A. Douglas, one of the owners—great prospects that promised wealth to the promoters. Extensive docks and expensive plants were erected; a fleet of vessels was purchased and placed in commission and a lighthouse was built to guard the entrance to the harbor. But like its neighbor on the Little Siskowit, a day came when its light went out and the works that cost hundreds of thousands of dollars were abandoned. Time has done the rest. Chipmunks hoard their winter food in the crannies of the foundation walls; a fox grins at you from the mouth of the caving shaft and swallows nest in the chimneys of the stamp mill. On a near-by island washed by the unsympathetic waves is a graveyard, now covered with wild briers—here rest the mortal remains of this enterprise that failed.

They were patient workers, those ancient people, and they left here a history of their mining methods that he who runs may read. With infinite toil they mined the metal, blasting the rock with fire and water, then freeing the metal with stone hammers.

Their fate, as far as the records of Isle Royal are concerned, bears the stamp of tragedy. In the full flush of their success they staked their tools, cached their surplus metal and went south, probably before the winter storms. They never came back. What overtook them no one knows—the earth seems to have opened and swallowed them up. It may have been war that put a sudden period to their industry. It is known positively that they were here in considerable numbers—that they had a well-organized mining equipment after the fashion of their times. Small caches of free copper that have been discovered show that they transported their output south by the way of the Sault St. Marie and also across the Upper Peninsula of Michigan by way of Keweenaw Point. Where they took the metal or who they were must be a matter of conjecture.

When Country and City Make the Same Grade

Rural Improvements Should Keep Up Hand in Hand With Urban Activity

By FRANZ A. AUST
Associate Professor of Landscape Design, University of Wisconsin.

IS IT possible that, like overgrown youngsters in school, both city and country have been allowed to "skip grades" because "they're so large for their age"?

Ever since a certain December day in 1773 when iced tea and revolution were brewed in Boston Harbor, this nation of ours has indeed been growing up very fast. Industries and agriculture have developed so rapidly that few of us have stopped to consider whether America could shoot up so speedily and still remain unharmed.

Much timber has been necessary for building and for fuel, so we have cut down our forests. Streams of water have been coaxed into the dry lands to give them more moisture and out of the swamp lands to give them less moisture. The brush lines in the unsettled parts of the country have been pushed back more and more until even the poets have begun to sing about the "last of the frontier."

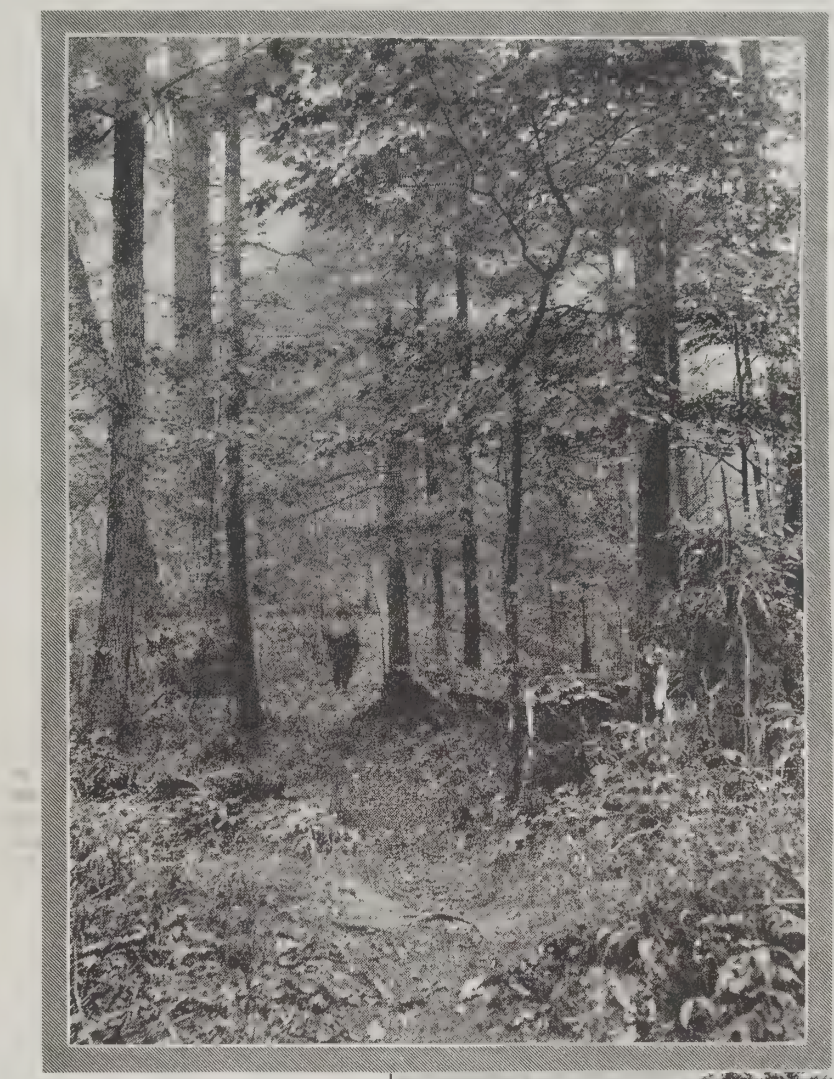
Changes like these affect climate and soil conditions everywhere. The cutting down of woodlands is lessening the great underground reservoirs where moisture for crops was wont to be stored as in a sponge. Where swamps have been drained, too, especially those far from lake or ocean, these reservoirs—the great balancers of moisture conditions—have been destroyed.

In parts of Illinois and Indiana, rainfall is not so evenly distributed as it was because the original forests scattered over the prairie lands have been removed; since the wind has free play over the land, the soil dries out too quickly; and when storms do come, there is sure to be intense erosion.

This same erosion, besides injuring crops and fields, is the cause of the filling up of river beds. Streams, large and small, all over the country, therefore, have not the power they possessed in the olden days.

What is the reason we have allowed rural America, precocious child though she is, to go on being promoted too rapidly at the expense of her physical health?

For years the cry has been, "Develop America's industries!" And beaten paths have been trod from forest to mill, from mine to factory, from country garden to city market and cannery. The quantities and varieties of products which our nation has been able to turn out at lightning-quick speed are tremendous. So it is no wonder that city eyes have become focused upon "How much can be done," unmindful of the beauty and the inspiration and even the needs of the country whence came that excellent material with which to work. Cities have in a sense been cut off from their vision of the out-of-doors, one of the "grades" most needed as a foundation for their best future work. And the country has been rushed along to keep up with city industry.



Above—The cutting down of woodlands like these is lessening the great underground reservoirs where the water for crops was wont to be stored as in a sponge. Right—Where original forests have been removed, there is intense erosion when storms do come, making it necessary to build costly concrete dikes.

An effort, however, has been made to direct city-America's growth in the right way. In 1893, a great World's Fair in Chicago, by means of its exquisite landscape designs, first stimulated interest in planning the city. Washington, D. C., as an example to all other cities, responded directly by transplanting within its boundaries an abundance of natural beauty. Today, there is scarcely a large city in the nation without suitable park plans and zoning laws. It is the natural reaction against the sight of brick and concrete walls and glaring pavements and the roar of machinery. Consciously or unconsciously it has been found necessary to bring back to folks that source of inspiration to move onward and upward—the great out-of-doors. And so we have tried in a small way to replace it, and thus to attain a greater degree of perfection in industrial centers.

But in this natural eagerness to gain the highest and best for industry, we have allowed rural America to "skip her grade" of country planning. For in all the thirty years since city planning was started, no general plan has been provided in the country to set aside land for the replacing of trees so rapidly taken away. No lands have been selected as moisture reservoirs; no general highway system has been worked out which would be best for the farm and the farmer as well as for the traveler; community centers have not been planned so that there would be greatest enjoyment, convenience, health, and good-fellowship for all.

And so it all boils down to this:

Cities are trying through city planning to extend themselves into the great out-of-doors, and thus to avoid missing the inspiration they need. The country must make up the "grade" she has "skipped" in trying to keep up with industry. Why should not city and country, by means of a broader country planning, steadily make their "grades" together? Only thus will be formed that bond of sympathy so much desired between the folk of the farm and those of the city street.

"It is owning a piece of ground which gives a man a definite part in the program of life," some one has said. Perhaps the very lack of this has been the cause in large measure of the social unrest of today. When country planning serves whole states as city planning has tried to serve the city, every citizen will feel a common interest in a piece of ground set aside especially to furnish the inspiration which the out-of-doors brings. That piece of ground should be large enough so that a man from the city can lose himself in it and forget that factories and railroads, strife and stress, ever existed. It should supply some of the social needs of the country community. It should give back to the nation some of that nature-health and nature-beauty which have been taken away. A few states have already made a beginning in this wider country planning. Massachusetts, through her extension division and town planning law, is reaching New England village and rural community center. California, too, has country planning laws in connection with her state colonization work.

In Wisconsin, a law has recently been passed which will go far toward causing the state to do her share in preserving the health and beauty of the nation, in supplying to city folk their inspiration, and to country folk their social life.

By means of her rural planning law, Wisconsin is arranging for the best possible roads. She plans for community centers where folks can come together for business and for pleasure. Country parks and playgrounds and tourist camps and fair grounds are all receiving consideration; community woodlands are to be set aside, and historic shrines are to be marked. Land along the river fronts and the lake shores, and beautiful outlooks from hilltops are being reserved for folks to enjoy.

A commissioner is appointed. He works with the state highway commission and with the state college of agriculture. He consults with the director of immigration in helping to place settlers on cut-over lands. He works with the various counties in their rural planning.

Every county, too, has a country planning committee. In addition to other duties, this committee consults with the town boards concerning designs for public buildings and bridges; it helps to choose designs and locations for works of art in public buildings, and for statues and memorials, so that these may all be permanent and dignified and suitable. It provides for the locations of community centers and for community parks and woodlands, so that all the residents of a certain section may have equal use of them. It gives advice about the planting of trees and shrubs and flowers along the highways so that they will not interfere with that highway's best service, and yet will furnish beauty and shade for all who pass that way.

Since the law has been passed, more than sixty per cent of Wisconsin's counties have organized, and many of them have started work. LaCrosse, the county where Hamlin Garland was born, has perhaps done more than any other by setting aside sixteen wayside parks, of from one to five acres in size, and two larger park areas. Funds have been raised for the care of the parks, but certain citizens have been public-spirited enough to contribute nearly all of the land. And the sites are well chosen. Old historical trails, a view of the coulies of which the famous author wrote, a beautiful outlook over the Mississippi, have often determined the location. All that this generation can do is to lay the foundation for America's future nature-health and nature-beauty and nature-inspiration for the millions of folks to come. City planning has become permanent. Country planning has just begun. And those who are giving of their time and energy today toward making the best of America's out-of-doors are the pioneers.

Where Side Shows Get Their Wild Men

"SEE Minny-ha-ha, that strange girl from the wilds of Madagascar," shouts the barker in front of the side show. "See a real royal princess of a tribe of savage aborigines. She looks like a monkey and yet she is human. Scientists claim that Minny-ha-ha is the real missing link for which they've been looking for thirty years. She is the only member left of a tribe of bloodthirsty cannibals who lived in the trees. In a battle with French soldiers, all her people were killed and she is now the only survivor of the race of monkey-men. Minny! Minny! Ha! Ha! Only ten cents to see the little lady who speaks the monkey language."

When the spieler had got his raucous anthropological harangue off his chest, you contributed your dime for the privilege of passing behind the gaudy canvas spread. You saw a spindle-armed, loose-jointed female creature with a head about the size of a grapefruit. She was dressed in a bizarre garb and lavishly adorned with a variety of ten-cent-store jewelry. Her complexion was a dark oak color (applied daily by her impresario).

Her forehead sloped back from the eyebrows in a straight incline to the crown of her head. Her diminutive skull came to a point on top like an inverted V. The hair on her head had been shaved off leaving a tuft at the crown which exaggerated her distorted appearance.

I happen to know that Minny-ha-ha was born not in Madagascar but in Southeastern Ohio in the hills that border on the Ohio River. She is not a rare specimen but has her duplicates in any institution for the feeble-minded.

She is what is technically known as a microcephalic idiot—"micro" being the Greek for small and "cephalic" meaning head. A microceph is a living argument for eugenics because this condition is entirely attributable to mental and physical defects, latent in the parents, which have been transmitted in grotesque form.

The Wild Man from Borneo, formerly an attraction with Barnum & Bailey's circus some years ago, was retired to the obscurity of a New York institution for the feeble-minded, where he is known simply as "Joe." Joe has a gnomish appearance, is about four feet tall, has a dark leathery skin and more wrinkles in his forehead than I have ever seen—a truly furrowed brow.

Joe also is an idiot, that is, he has less intelligence than a three-year-old child. He is unable to talk but jabbers occasionally or merely grunts. His greatest intelligence is displayed when he approaches visitors and feels their pockets to see if they have brought him any chocolate. Joe is of the type of feeble-mindedness known as cretinism.

BRIEFLY TOLD

The machete is the universal implement in Costa Rica and other Caribbean countries, and it is carried by every country laborer. It is used for chopping brush and trees, clearing ground; cutting grass and sugar cane, killing and skinning animals, for offense and defense, and for almost every conceivable purpose. Two types are used: The machete de suelo which has a long blade rounded at the end with the cutting edge sloping toward the handle, the end being much broader than that part near the handle; the other simply a long straight knife.

A gross profit of $379,000 was made by the Leviathan on her maiden trip, according to figures issued at Washington. Receipts on the outward voyage from New York to Europe were $411,000 and those on the return trip $368,000. The actual operating expenditures, not including capital cost and other overhead, for the round trip totaled $400,000.

Edward W. Bok will pay $100,000 for the best practicable peace plan. This plan must provide a practicable means whereby the United States can take its place and do its share toward preserving world peace, while not making compulsory the participation of the United States in European wars, if any such are, in the future, found unpreventable.

Peanut oil is one of the prime necessities of the average Chinese in South China. As a cooking oil and foodstuff it means to the Chinese what olive oil does to the Spaniard or Italian and lard to the American. Large stocks of peanut oil are always maintained in Hongkong. Most of the local oil is crushed from nuts grown in the colony, South China and in North China.

During a debate in the South African Assembly relative to an appropriation of a quarter of a million pounds for the relief of unemployment, two radicals from Johannesburg chained themselves to the rail of the public gallery, and from there insisted on addressing the House. It required half an hour to unchain them. General Smuts and the Speaker of the House refused to prosecute the offenders.

The Paris City Loan Bank, or municipal pawnshop, has added an automobile section to its activities. Two plots of land have been acquired on which garages are being built for the purpose of housing machines of temporarily impoverished sportsmen.

They are turning tin cans into copper in Arizona. In many of the mining centers carloads of tin cans as well as scrap iron are put through a process to extract the copper from water seepage pumped from the mines. The water contains a small quantity of copper and the scrap iron and cans go into solution and the copper is deposited in the bottom of the sluices containing the scrap. A very low expense is involved in this process.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

In case of a bite from a venomous snake far from hospitals and doctors: Grasp the limb above the bite. Tie tightly and knot strings. This will localize the poison. Make ten deep incisions with sharp knife or razor crisscross over the snake punctures, five each way at right angles which will result in a checkerboard effect directly over the fang marks. Suck out poison that does not come out with flowing blood. In thirty minutes loosen string but if poison effects follow tighten string again. This must all be done quickly.

A wild rubber plant, resembling slightly the Texas greasewood bush, grows in Texas. It is the only rubber-producing plant known to grow uncultivated in North America. It is found in the Big Bend country of both Texas and Mexico. There is a rubber factory located in Brewster County, Texas, which manufactures rubber from this plant.

Twice within a few weeks the Imperial German flag has been hoisted on Dutch soil, once at Wieringen, when a yacht called *Hohenzollern* flew it on the occasion of a mysterious visit to the ex-Crown Prince, and again over a seaside villa in which the ex-Kaiser was visiting. A prominent London daily states that the ex-Crown Prince is planning his escape to Germany, that he is in communication with the German Nationalists, and that he is popular among ex-soldiers.

When the sea birds gather on the isles of the Pacific Northwest in Alaska and British Columbia, in June, the Indian follows the white-winged flocks for his summer harvest of eggs. He takes only the first and fresh-laid clutches, allowing the later eggs to hatch. But international law must be rigidly observed and the migratory birds are protected in their nesting. There may be some excuse for the Indian in gathering these eggs, for his forbears did so thousands of years ago. However, there is none for white men or Japanese, who would sell these eggs in bakeries and restaurants of the coast cities, and it is with these nest pirates that the law is operating most.

Grass is growing luxuriantly on the tops of thousands of freight cars lying idle in the railroad yards of the Ruhr Valley. Most of them are filled with merchandise and have not turned a wheel since the Belgians and French marched into the industrial area last January.

School children all over England are playing the races, deserting their books for bookies. Testimony given by a woman school teacher at the government's inquiry into betting revealed that out of a class of forty-two boys, averaging eleven years old, nineteen admitted they backed horses. She also suspected others in the class of playing the ponies with their pennies. She said they talk about form, the size of the horses and the abilities of the jockies. The youth of the land hardly get off their rocking horses before beginning to back the real thing.

The new honeymoon cars made by the Pullman Company insure daytime as well as nighttime privacy to passengers. The cars already are in operation on most of the transcontinental roads. When the berths are made up, a new style partition going from the seat to the ceiling gives the occupants absolute seclusion. Newlyweds hail the innovation with joy.

Alaska is capable of raising every pound of beef, every sort of vegetable, and every pound of butter or other dairy product that her people will need till the white population increases to 200 times its present number.

The Schlosspark Theater in Steglitz, a suburb of Berlin, is taking farm produce in lieu of money. For the best theater seats the price is a pound of butter, or the equivalent in marks at that day's butter quotation. The cheapest seats are sold for two eggs, or their value in paper marks.

Morris Gest has succeeded in extricating from Bolshevik Russia his father and mother, his two sisters and their children—twenty-one of his kin, in all. A Paris dispatch states that it is doubtful if he would have been successful in obtaining passports for his people but for the aid of officials of the American Relief Association. He will bring the twenty-one to America as soon as the necessary arrangements are made for their admission.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

9-1-23

The "Cease and Desist" in Unfair Business

Federal Trade Commission Activities in Breaking Up Dubious Practices Reveal a Certain Class as Heaviest Offenders

IT WOULD seem that the Federal Trade Commission could expedite its business and better protect the consumer and reputable business man by creating a "Bureau of Jewish Affairs" to cope with the problem created by exploiters of the buying public.

The records of the commission disclose an interesting condition of affairs when its list of Jewish offenders is studied. Jewish individuals and concerns were the object of between twenty-one per cent and thirty-three per cent of the orders to "cease and desist" from unfair methods of competition, according to the latest volume of decisions published by the commission. It is difficult to establish the full extent of the Jewish violations of the law enforced by the commission since so many Jews operate under general company names while many others have adopted good old American family names.

Volume four of the decisions of the commission, the last one published, would indicate that considering the percentage of Jewish population, they get into the toils of the Federal Trade Commission proportionately about seven times as often as the rest of the population.

Uncle Sam's official reports upon these exponents of Jewish business methods make racy reading. They deserve a wider circulation. The law clerks and trade papers immediately concerned should share this new literature with those who like to read the romance of business.

An Enterprising Group

ONE of the most persistent offenders is the Wolper aggregation of Chicago, a group in the mail order grocery field. Louis, Jacob and Albert Wolper doubtless believe the Federal Trade Commission is a handicap to enterprising men.

The commission vainly tried to squelch the Wolpers by issuing a "cease and desist" order Docket 352, October 25, 1920, against L. I. and H. B. Wolper, copartners trading under the Gentile names and styles of "Errant-Knight Co., Lewis Grocery Company, and Ira Lester Company." This interesting collection of Gentile letterheads was the basis for the Wolpers' attempt to dupe those who take Gentile advertising at its face value because of the general good character of most present-day advertisers.

The commission found that the Wolpers advertised a "free" catalog which could only be obtained through ordering One Dollar's worth of groceries. They claimed to sell sugar at three cents a pound when its wholesale price was nine and one-half cents and difficult to obtain and flour was offered at $7 a barrel when its wholesale price was $12.75 a barrel. They compelled buyers to purchase "combination" lots of groceries to obtain these ostensible bargains in sugar and flour. The commission found the prices and qualities of the other items in the combination lots were so manipulated that the customer paid more for his merchandise than if it had been purchased through regular retail channels. The Wolpers claimed to control the entire output of factories and to have such buying power that their customers could save thirty per cent after paying the freight charges. They did about $10,000 worth of business a month during the first four months of their operations.

Although the Wolpers abandoned these particular Gentile trade names in compliance with the orders of the commission, they did not stop their practices. They immediately started up as "Alben-Harley" with the four Wolpers in charge. There is an old established and honorable mail order grocery house by the name of Harley whose good will was endangered by the ubiquitous Wolpers.

Even in Coal Business

THE commission detected the new Wolper concern and in its second report found they were making more deceptive offers than when they were first tried. The commission clearly states that it is the same business it had previously ordered discontinued, Docket 706. John F. Rosen was attorney for the Wolpers in these cases.

The coal mining and selling concerns have been accused of many things, but nothing much worse than the commission's finding against Ruby K. Levy, of Chicago, and the modest Samuel Levy, her husband, whom she employed as her general manager in the operation of their Bernice Coal Company. Time did not permit an investigation of the reason for putting the Levy's business in the wife's name. The syllabus of the case tells the tale which does not need any adornment:

"Where the operators of certain Southwestern coal mines, the product of which greatly resembled Pennsylvania anthracite, long marketed the same extensively as "Bernice Anthracite" under which name it had become widely and favorably known to the trade and to the consuming public; and thereafter a middle western coal dealer, and her general manager (husband), who neither dealt in the genuine Bernice anthracite, nor owned nor operated coal mines.

"Adopted and used the trade names Bernice Coal Company and Guaranty Coal Mining Company in their business of selling coal purchased in wholesale quantities from mine operators and other dealers; and

"Published and circulated booklets and other advertising matter wherein was written and featured 'Bernice Coal Company' and 'Bernice Burns Best' and wherein was set forth that they sold coal direct from their 'Bernice' mines, and so forth." Ordered to "cease and desist."

Rochester, New York, has obtained an unusual position in the men's fine clothing manufacturing industry. It is unique in having one of the few remaining Gentile factors in the business. The good working conditions; high quality of product and excellent business methods of Rochester concerns have tempted certain Jews in New York City and other places where sweatshops are operated to palm off their stuff as Rochester clothing.

The commission became so aroused over the situation that on July 23, 1923, it sent a notice to the press of the country denouncing the practice and naming Samuel Blum, who used the words "High Class Tailored Rochester Art Clothes," and Philip Moskowitz, trading under the name of "Rochester Clothing Company," although both of these fellows sell clothing manufactured in New York City.

Ho[illegible] similar fame should not be denied to M. Nagelberg and E. Feigenbaum, partners styling themselves "Rochester Tailoring Company." The commission told them they couldn't manufacture clothing in Scranton, Pennsylvania, under such a misleading name.

The roll of dishonor includes Henry J. Briede and W. P. Rogovsky, of Chicago, who did business under the names of Briede and Rogovsky; Schwabe Brothers; The Old Woolen Mills Company and the National Tailoring Company. The commission found this much-named pair did not operate an old woolen mill or any other mill and that it was pirating the good will of the old established International Tailoring Company.

More Jewish offenses in the clothing business could be described, but let us explore the cutlery field.

Objectionable Practices

THE ancient Cutlers Company, of Sheffield, England, whose function is to take care of the trade-marks and protect the name of Sheffield in the cutlery industry, successfully opposed Samuel Bernstein's crude attempt to dignify his Cuba, New York, junk with a "Sheffield" trade-mark. The Examiner of Interference in the Washington Patent Office told Sammy, in effect, "Yes, we have no trade-marks for Hebrew 'Sheffield' knives made in Cuba, New York."

Bernstein's optimism was not repressed by these snubs. He went ahead scorning official trade-marks until the commission cut him down with a "cease and desist" order.

Sol Goodman and Adolph and Irvine Greenspan, trading under the name of the Solus Manufacturing Company, were sternly informed by the commission that they were not selling razors in accordance with the law.

Irving Stern, Irving Kestin, S. W. Singer and D. M. Rosenberg, styling themselves Singer, Stern & Company, were informed by the commission when it looked into their little razor business "that such mislabeling or misrepresentation of price under the circumstances set forth constituted an unfair method of competition."

Marx Finstone, Shatkun & Kahn, Abraham Shatkun, Levin Brothers and several others were ordered to "cease and desist" from wholesaling cheap fountain pens, at from ten cents to fifty cents each, in display cases or cards indicating to the retail buyer that they were regular high-priced merchandise.

Washington, D. C., is a sort of Jerusalem for Hebrew merchants, as any pedestrian on Pennsylvania avenue knows. Walking through its retail district on Sunday morning one finds scores of them doing a wide-open business. The Federal Trade Commission has on numerous occasions found it necessary to interpret business ethics to some of these people.

A. Lisner trading under the name "Palais Royal" was ordered to stop advertising ordinary nitrated cellulose toilet articles as "white ivory."

No Charge for Credit!

THE Julius Lansburg Furniture Company was engaged in making the false statement in its advertisements that it made no extra charge for credit. The commission ordered this and several other concerns to stop this practice of deceiving credulous poor people.

The Jews have been practicing enormous frauds upon the consuming public through the position they have obtained in the sponge business and the practices the commission has found them employing. Whenever a certain sort of Jew enters a trade or industry he soon becomes notorious for lowering its standards and practices. The user of sponges will be thrilled to read of the tribute he has been paying to the commercial pirates whose product comes from the Spanish Main where buccaneering was once conducted under more honorable standards. Morgan might have hanged a trader at the yard arm for selling him sponges loaded as these modern traders have been doing.

Lasker & Bernstein; Joseph Bloch, Inc.; H. L. Ettman Sponge Company; M. F. Rosenbaum and other Jews too numerous to mention were put under the interdict of the commission for defrauding the public through deceptive practices in the sponge business.

Extracts from the findings in the case of Lasker & Bernstein reflect the other cases as well.

"That in the conduct of its business respondent for more than two years prior to the filing of the complaint had been engaged in artificially increasing the weight of sponges by a process of soaking said sponges in a solution of a substance or substances such as salt, Epsom salts, glucose, glycerine and sugar;. . . .

"That the total cost of 'loading' one pound of sponge including the cost of ingredients and labor is approximately twenty cents; . . . . that the sole purpose of 'loading' is to increase the weight of the sponges while they are in the channels of commerce before they have reached the ultimate user; that when said sponges are put into use the substance introduced in the process of loading is generally washed out and lost.

"That respondent in selling 'loaded' sponges to sponge packers and wholesale dealers did not disclose or make known to the amount of matter artificially added; that the loading of said sponges was paid for by said sponge packers and wholesale dealers.

"Loading" of Sponges

"THAT the 'loading' of sponges is a fraudulent and deceptive practice and results in injury to the public.

"That the sale of 'loaded' sponges has the tendency and capacity to and does force competitors also to sell 'loaded' sponges to the injury of competitors who do not sell 'loaded' sponges and to the injury of the public."

Several years ago the government made a Jewish concern its exclusive agent for dressing and selling the Alaska fur-seal skins, which are a government monopoly. The government and the contractors have been under a continuous fire of criticism ever since they were made. *That one branch of the government was after the contractor for his business methods while another branch was strenuously defending the contractor against other charges* and United States Senator Seldon P. Spencer, of Missouri, was doing missionary work for the contractor, and his law firm was its retained counsel, makes a sordid chapter in Washington history.

Since it is not generally known that the Federal Trade Commission has had its eye on the fur-seal contractor the following quotation from the annual report of the commission for 1922 is given—(the italics are ours):—

"Complaint No. 599—Federal Trade Commission vs. International Trade Exchange, Funsten Brothers & Company, F. C. Taylor Fur Company (all three joint concerns and the government fur-seal contractor) and Mallory, Mitchell & Faust. Charge: Using unfair methods of competition by *refusing to advertise in newspapers except upon condition that the advertising matter from competitors setting forth the prices said competitors are willing to pay for furs purchased from trappers and hunters be declined;* and that by reason of the position of respondents in the fur purchasing business *newspapers have been so coerced* with the effect of depriving the owners of furs of the means of knowing the prices competitors of said respondents are willing to pay therefor, in alleged violation of section five of the Federal Trade Commission Act.

Public Should Act

"DISPOSITION: Dismissed for the reason that the International Fur Exchange; Funsten Brothers Company and the F. C. Taylor Fur Company have gone out of business."

Since the Fouke Fur Company, controlled by the Eitingon-Schild Company, was created upon the failure of the above concerns and was given the government fur-seal contract the concerns under the charges of the commission had been handling, one's curiosity is aroused.

Did Colonel Fouke, Spencer & Donnell or Senator Spencer, whoever informed the commission that these concerns had gone out of business, give the commission the whole story and permit it to know that the Fouke Fur Company had taken over its business and contract with the government? Has the commission satisfied itself that the successor concern, so far as the contract is concerned, is refraining from the practices charged in Complaint No. 599?

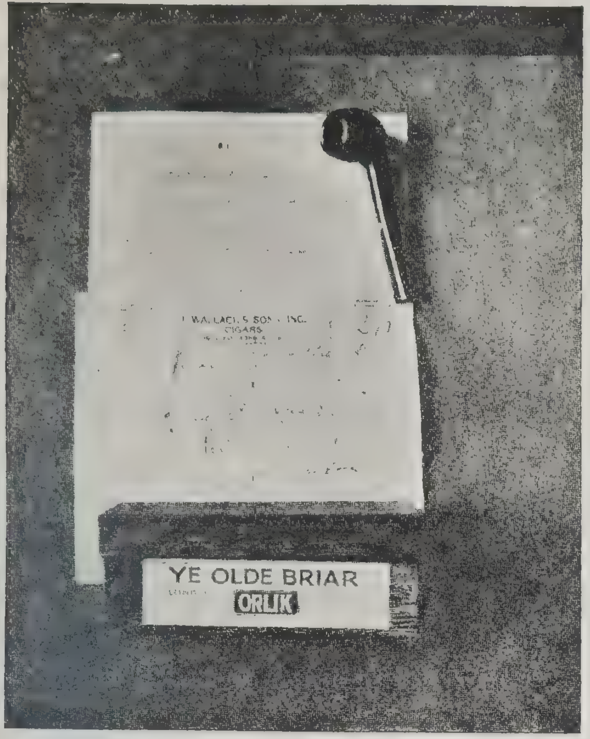
The last inquiry is made because it has been charged that the Eitingon-Schild Company, which controls the Fouke Fur Company, is endeavoring to control the fur business of the world, and that its position as exclusive government contract puts it and its subsidiaries in the very position to coerce the press that is mentioned in the official charge.

Of course if the Fouke Fur Company is not doing the things the commission charged its predecessors, also controlled by Colonel Fouke, with doing, the commission was justified in dropping the matter; but the record does not make mention of the successor concern.

It is hoped publication of these facts will put the public on its guard and cause people promptly to notify the Federal Trade Commission of similar deceptions.

A Little Story on Retail Store Profits Your Paper Didn't Publish

Yes, of Course, It Is True That It Wouldn't Be Good Policy to Risk Offending the Advertisers, and *You* Don't Count, You Know



A briar pipe made in England and landed in this country at a cost of $\$1.09\frac{9}{10}$ was sold for \$5.00, the percentage of retail price to landed cost being 357.

AMERICA, enjoying another business boom, is optimistic, and therefore not much attention has been paid to a warning against price inflation sounded a few weeks ago by an official of the Treasury Department, who said in effect that the surest way to disrupt the new era of prosperity is by profiteering, indicating at the same time that such a movement for excess profit taking had already been started in certain retail lines. In other words, the lesson of the so-called "buyers' strike" has been forgotten.

It is quite likely that many commentators threw aside the clipping containing the warning of the Treasury official in the honest belief that he was merely of an apprehensive turn of mind, and without the least suspicion that he may have had facts and figures on which to base his charge of profiteering. But the fact is that he did have the figures, based on actual purchases and backed up by photographs and other official records. It is true also that every newspaper in the United States receiving the *Congressional Record* has had the same figures, although for obvious reasons the newspapers could hardly be expected to do much about the situation therein revealed. A mark-up, for instance, of 757 per cent in the cost of a pearl necklace by B. Altman & Company, of New York City, is not an item for discussion in the news columns. And it is quite likely that Stern Brothers, of New York, are not particularly anxious to have the newspapers inform their readers of a mark-up of *two thousand, five hundred and eighty-eight per cent* in certain vegetable ivory buttons imported from Germany.

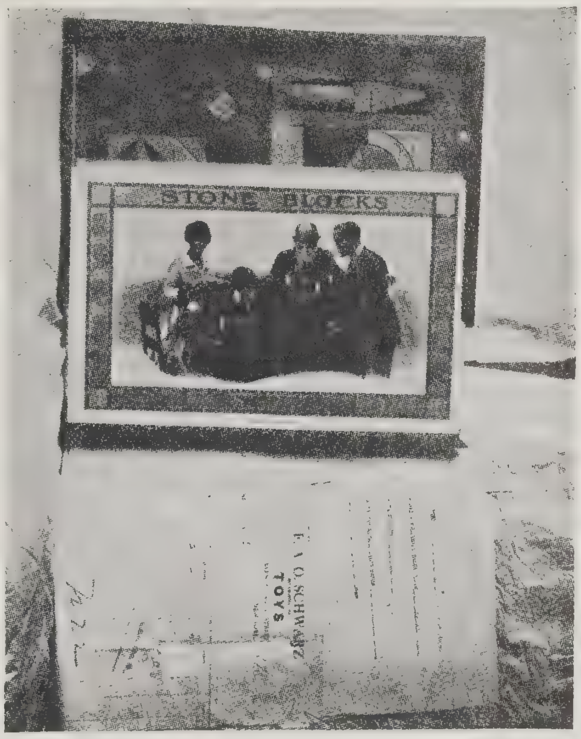
Those figures are taken at random from a government publication of which, curiously enough, little has been heard. It came to the attention of the writer through a confidential "tip" from a government employe who has been wondering for more than six months why the country has heard so little about it. He suggested that the volume had been "suppressed" and that it might be impossible to get a copy. Instead, it appears that the publication has been "forgotten" by a sort of mutual consent. Anybody can get a copy by writing to his Senator or Congressman at Washington, or it can be found in the files of the *Congressional Record*. And the story it tells is important to every American, either as consumer or as wage earner, or as both. Its interest is not only in its revelation of retail gouging of consumers. There is a lesson in it also for the manufacturer of what he may expect from European competition.

The volume referred to is entitled "Imported Merchandise and Retail Prices." It was printed on July 31, 1922, the following subtitle explaining why: "Letter from the Secretary of the Treasury, transmitting, pursuant to request of the Senate Committee on Finance, a report by the Treasury Department on Foreign and Landed valuation of imported merchandise and the retail selling price in the United States of the same commodities." It contains 120 pages of the textual and photographic records of 251 separate and distinct purchases of different articles of merchandise, the bulk of them made from stores in New York City. The first exhibit, however, tells of a purchase made June 12, 1922, from Rothchild & Company, Chicago. On that date an agent of the United States Treasury Department bought from that firm a pair of sixteen button ladies' kid gloves, twenty-four inch length, for \$6.95. The merchandise was traced by the government through customs and other channels. It was found that the gloves were made in Germany, where they were sold to the American importer for seventy-nine and one-half cents a pair. Transportation, freight, insurance and similar charges cost three and one-half cents a pair. The duty, at the rate of \$4.50 a dozen pairs, cost thirty-seven and one-half cents, making a total landed price in the United States of one dollar twenty and one-half cents. Therefore 477 per cent is the percentage of retail price to landed cost.

It may be thought that the percentage figures so far given are unusual, but such is not the case, as will be shown. Before going into the detail of the wide range of merchandise covered by the investigation, however, it may be well to quote from the official record explaining why the inquiry was undertaken

"For the purpose of obtaining official information concerning foreign values of imported merchandise and the retail selling price of this merchandise to the American consumer, the Treasury Department and the Senate Finance Committee undertook a joint investigation. At the request of the chairman of the Senate Finance Committee the Secretary of the Treasury ordered the Appraiser of Merchandise at the port of New York, where seventy-five per cent of our imports are received, to report the facts from government records showing the country of origin, the foreign value, transportation and other charges, the duty paid, and total landed cost of a large number of articles purchased by consumers in New York by request of representatives of the Finance Committee.

"The articles which make up the tariff exhibit cover a wide range of both necessities and luxuries, from common floorcloths, soap, shoes, knives, scissors, flatirons, and curling rods to silk embroidered lingerie, fancy clocks, laces, linens, hats, chinaware, doilies, pipes, cutlery and toys. This list could be extended indefinitely to embrace thousands of articles.



These stone blocks, turned out in Germany for $21\frac{7}{10}$ cents, were landed in the United States at a cost of 35 cents. They sold for \$4. The percentage of mark-up was merely 1,042.

"These articles were manufactured in more than a score of different countries, including China, Japan, England, France, Italy, Germany, Czecho-Slovakia, Yugo-Slavia, Hungary, Belgium, Spain, Holland, Denmark, and Switzerland, where the cost of production and of labor are far below similar costs in the United States, due to a variety of conditions, from depreciated money to lower standards of living and sanitation, longer hours of work and child labor.

"On the following pages will be found photographs of foreign articles and accompanying each the sales slip showing the retail selling price together with a brief report of the United States Government appraiser of the foreign value, landed costs, and so forth, of these commodities when they passed through the United States Custom House. The facts concerning the additional exhibits are given without photographs, although the original invoices and receipts are in the possession of the finance committee.

"In many cases the importer was also the retailer; in other cases, the importer has made his profit between the importation and the retail sale. In any event it will be noted that the landed cost to the importer of any article limits the selling price which an American manufacturer could secure for a similar or comparable article. If goods from abroad can be landed at a certain cost to the importer, the American manufacturer will have to meet this cost to compete with these imported articles on the basis of that landed cost.

"In submitting this report on the tariff exhibit to the Senate, the Finance Committee calls attention to the following facts established by the joint investigation of the Treasury Department and the committee:

"1. The low cost of foreign production.

"2. The low duty collected by the government.

"3. The vast amount and percentage of spread between the foreign value and American retail selling price, and the total landed cost and price to the consumer.

"4. That the duty collected and the duty proposed in the pending tariff bill should not increase the price of this merchandise to the consumer.

"5. That the duty proposed by the pending bill will in no instance stop importation.

"6. That the importer can easily pay the tariff duties without increasing the retail selling price. In other words, the spread between the foreign purchase price and the selling price by the importer is sufficient to absorb the tariff duty many times over without any increase of the selling price of any of these imported products."

In a letter signed by Secretary of the Treasury Andrew W. Mellon accompanying the report the source of the information was stated as follows:

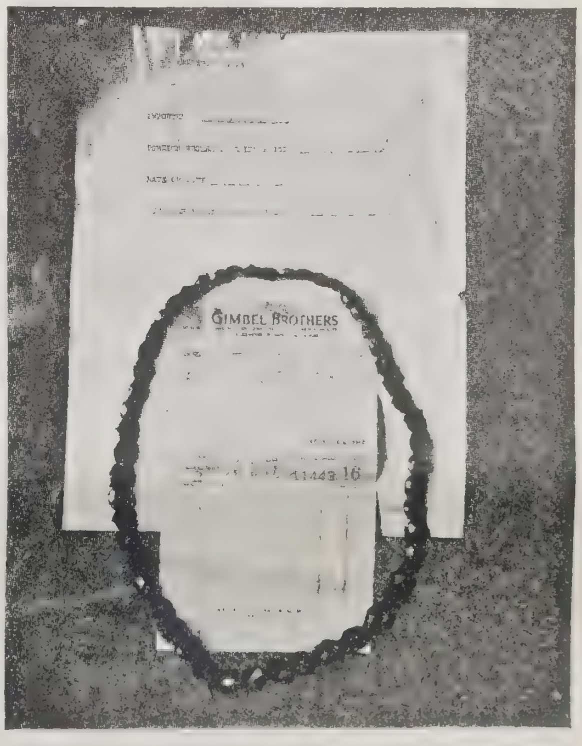
"This data was prepared in the office of the appraiser of merchandise at the port of New York from invoices and entries on file in the customs office at that port. Each sheet submitted bears an identification letter and number corresponding to the letter and number appearing on the particular article to which the sheet relates, the articles representing identical items of merchandise, or duplicates thereof, covered by the invoice and entry from which the data was secured.

"The exhibits in question were presented to the appraiser's office and inspected and identified by examiners who pass upon the particular lines of merchandise involved. Proper record has been kept by the appraiser of invoices and other sources of information, and the exhibits have been forwarded to your committee under customs supervision."

The first photograph in the document shows a reproduction of six table knives. Beside them is a sales slip showing that the knives were sold by Gimbel Brothers, New York, May 26, 1922, at thirty cents each. The records furnished by the government show that the total landed cost of each knife was three and eighty-five one-hundredths cents, so that the percentage of retail price to landed cost in this instance is 679. A mere 258 per cent mark-up for a glass lamp chimney and 280 per cent for a glass lamp dome, both purchased from R. H. Macy & Company, New York, are shown on the next page. After that comes the record of a sale of mustard fruit, in tins, from Italy, for seventy-five cents, a mark-up of only 167 per cent, and then a briar pipe from England, sold by J. Wallack Son, Inc., New York, at \$5, which yielded 357 per cent profit over the landed cost. Another jump is made on the next page, containing records of the sales of two electric flatirons, apparently exactly alike, by the Zuckerman Electric and Machine Company, of New York. On May 26 the profit over landed cost was 617 per cent, the iron selling for \$5.50. But on June 10 the same irons were sold for \$6.50, showing a mark-up of 747 per cent.

It would be possible to fill many pages with instances

(*Concluded on page 14*)



This little string of amber beads which came from Germany cost, landed in the United States, 76 cents. It sold for \$12.50. The percentage of mark-up was 1,544. Not bad, eh?

Coal Can Make Coolidge

IN SPITE of the efforts of a few to ring the political fire bell, President Coolidge has the good wishes and—what is far more solemn—the almost pathetic good hopes of the American people. They are looking to him with more hopefulness than they have felt for a long time. There seems to be growing up a feeling that in this man there may be hidden reserves of determination and power which will swing the nation clear of some of the hindrances now distressing it.

Taken altogether, the national atmosphere is favorable to action. The spirit which was beginning to manifest itself during the latter months of Mr. Harding's service seems to have dissipated in the general shock following the President's sudden death. Many animosities and discouragements have disappeared and the dead President left behind the legacy of his fine personal nature rather than a legacy of political disagreements.

It does not matter that Mr. Coolidge is an astute politician. If he is so, we may be sure that the character of politician will gain dignity from him. He believes in party, but not as a stepping stone to office; he believes in party as indispensable to our American form of government. Moreover, he believes in party not in the sense of believing in his own party alone, but in the sense of believing in both great parties as the exponents of political principles and as the vehicles of the people's reactions to those principles.

Nor does it matter that in at least one appointment the newspapers pretended to be somewhat shocked by Mr. Coolidge's choice. There is a disposition to give the President the men he wants, if so be he can start the ball a-rolling and get something constructive done. To begin a policy of carping and snapping at the President is really to carp and snap at our national interests.

Mr. Coolidge has already made it plain that he is not to be fooled by useless conferences nor by useless confabulation about foreign affairs. He has already indicated that as he was able to keep himself with great good taste within the confines of his office as Vice-President, he is now able to assert himself easily in his office as President.

So that, taking it all together, there is rising in the country a spirit of hopefulness, not untinged in many quarters with the beginnings of a spirit of expectancy.

No one knows, at this writing, what the President has up his sleeve with regard to the coal situation. The intimations out of Washington seem to be entirely in the tone of confidence, without blustering. Announcement and not threatening seems to be the style of the new President.

It goes without saying that if President Coolidge shows the country an ability to handle the coal situation so that a full winter's fuel shall be put within the reach of all the people, it will not matter what he may do in other things, he will be hailed as a statesman and as America's friend. We have lacked statesmen who could do the daily things. Statesmen have been made by oratory, by diplomacy, by daring promises, by alluring visions of a Golden Age directly to appear.

Coal can make Coolidge.

The Nation Is in Session

A CORRESPONDENT objects to a statement which indicated that we are glad Congress is not in session. It is not that we have any disrespect for Congress or for Congressional sessions; we are glad because now the nation is in session.

Let us get rid of the notion that a Congressman is on duty only when he is in his seat or in his office at Washington. He is on duty from the time of his election to the time of his withdrawal, wherever he is. He is as much on duty when he is at home as when he is at the Capitol.

Indeed, it may be said that the nation gets more good out of the time its Federal representatives spend at home, than out of any time they spend away. For at home they feel what the people are thinking and hear what the people are saying. If laws are to amount to anything or if policies are to command the fealty of the people, it must be because laws and policies reflect the spirit of the people.

The atmosphere of Washington is vitiated. Members of Congress should be equipped with some kind of mental gas mask to prevent their minds being twisted. The point of view of Washington tends always to sink lower and lower toward the concerns of office and party. There are patriots there, many of them, but they don't set the pace. The deadly power of routine to lower the political morale is early felt by its victims, and easily seen by all observers. It really takes six months at home to equip a man to withstand two intensive months at Washington.

So that there is no loss to the country by Congress being at home. There is rather a great gain. When Congress reassembles it will know exactly where the public mind is standing. And this should be a valuable bit of knowledge for Federal legislators to possess.

She Stepped Off the Standard

"WILL England Return to the Gold Standard?" is the caption of an article in Mr. Barron's Boston paper. The question is rather startling, and thanks are due to the general openness of mind that characterizes Mr. Barron's financial publications, for its admission to the light. For the question indicates that England has been off the gold standard —England who led the whole world to the gold standard, whose international financiers wrote one of the most shady chapters in the financial history of the United States, England whose gold sovereign was sovereign the world around! And it indicates further that there is some doubt, or if not doubt some uncertainty as to the time when England shall return to the gold standard. But worst and most dangerous of all, it indicates that a country can exist without the gold standard.

The uncertainty comes of the fact that in England there is an upheaval of honest and able minds about the whole money question. Of all countries, she is most dependent on sound money and trade, but upon trade more than money and upon money only as the servant of trade. When, however, she discovers, as lately she has done, that money is becoming a trade by itself to the detriment and the destruction of British trade, then money draws to itself a scrutiny it has never had before. In the United States we are still in that adolescent stage which relegates criticism of the money system to the limbo of "nuts" and red radicals. In England they are able to see that criticism of the money system is the sign of commercial maturity. We are rapidly becoming commercially mature in this country, hence the challenge of Business to Money. Money as the Master of Business is done. Money as the Servant of Business may remain.

The article in Mr. Barron's paper recites that learned men are speaking out as never before on this question. THE DEARBORN INDEPENDENT has recently printed some of those utterances. Professor Cassell, we are told, says of the gold standard: "It was never satisfactory and it has now become practically impossible."

It isn't a question of gold as gold. It is simply a question of limiting the money of the business world to the amount of metal privately owned. When the money of the world can be periodically contracted to make it measure up with private stocks of gold, no one will pretend that the system is intelligent, the process humane, or the principle moral.

The world is already off the gold basis for the sufficient reason that the gold basis is not broad enough to support the world.

America's Autumnal Festival

NOW comes the season of county Fairs. The old grounds are raked up, the buildings whitewashed, the palings of the race track repaired; there's a vision of pumpkins and fruit, there's a suggestion of odors from cattle pens and the loud carolling of poultry sheds; there is the spirit of that great autumnal holiday of the American people—Fair Time.

Don't fail to go to the Fair. Whether it be a pretentious state Fair or just the county Fair, don't fail to go and take the children. This counsel is doubly emphasized if you happen to be city folks. There is more downright "country" in a fair than in a summer vacation. City people get the idea that they are supported by grocery shelves and that their food sprouts in tin cans. The can-opener has come to be one of the principal appurtenances of urban housekeeping. But at the Fair you see the beginnings of things, you meet the man and the woman who had the production of your food long before the grocer saw it. You begin to see beyond the counter to the fields.

And if you are country folks, don't fail to go to the Fair. Town and Country depend on each other. Just as the Country has done more for the Town in the matter of food, so the Town has done more for the Country in the matter of labor-saving devices. The farmer ought to put himself up-to-date on the machinery which is ushering in the era of power-farming. And his family ought to be permitted to see that there is now no obstacle to living the finest kind of city life, so far as comfort is concerned, on the farm. The Farm, plus all natural advantages, plus all city advantages, minus all city discomforts, is the dream of millions of celled-up citizens.

Go to the Fair and see the yellow honey and the golden butter, and the prize embroidery and the reddest apples, the biggest potatoes, the most succulent melons, the fattest steers, the wooliest sheep, the proudest roosters, the noblest horses, the prettiest girls and the best people on earth.

Licensing Wrong

GREAT BRITAIN proposes to create additional revenue by taxing betting in all its forms. Whatever the outcome, the principle is wrong and in the end will cost more than the apparent returns. Taxation in essence is equivalent to license, and to license vice is to legalize it. Governmental legalization of vice is demoralizing to the masses. But worst of all, politically speaking, it gives power to the forces of evil.

An example is found in the political power of the liquor interests in the United States, a power based solely on an immense public revenue exacted in the form of a tax upon the vending of intoxicants. The saloon was an evolution of specific taxation. Before regulation of the liquor business became a source of revenue there were practically no saloons. Liquor as a commodity was to be had in groceries and in hotel or tavern "taps," but the saloon was born of taxation. Putting betting on a licensed basis, as Great Britain proposes, or putting even darker vices in the same legalized position as some less enlightened governments do, is simply loading the body politic with a moral stigma which sooner or later national shame and expense will cause it to destroy.

One Village Without a Debt

UNIQUE among American municipalities stands the village of Regent, North Dakota, which has no bonded debt, has about $4,000 on hand, and is about to invest in an electric lighting plant, for which it will pay spot cash.

The thrifty citizens of the community have been interested in the discussion of municipal bonds in THE DEARBORN INDEPENDENT, and the editor of the Regent *Times*, a weekly above the average in appearance and intelligence, has deemed it worth while to broadcast the distinction of Regent as a municipality which has functioned for the dozen years on a cash basis.

In reporting the action of a meeting of business men to discuss the advisability of buying an electric plant offered the community at a bargain price, the *Times* says:

"The treasury has about $4,000 on hand and does not owe anything to anybody. This fact should be broadcast, as it is a rare thing for a village to live a dozen years and at the end of that time be free of debt and have money on hand. We shall call the attention of THE DEARBORN INDEPENDENT to this. Putting in an electric light plant without issuing bonds is a real feat."

THE DEARBORN INDEPENDENT congratulates the village of Regent and the state of North Dakota on the character of a citizenship so proud to be out of debt.

Mr. Ford's Page

IT IS futile to expect all the people to think alike Perhaps nothing that could occur in human society would be more fatal to progress, or even to life itself, than just that. It seems impossible for even two people to think alike, especially in matters where only the intellect, the judgment, is involved The fault of most of the Apostles of This and That is that they think that the performance of their duty and the fulfillment of their mission depends on winning the world to their point of view. They do not see the really important truth that a point of view is served when one man takes it.

How far we are complete individuals and how far we are only parts of the larger organism which we call human society, we do not know There are those who say that Society is the complete organism, and persons the atoms that comprise it. How far this statement goes toward final truth, one cannot say, but there seems to be truth in the view that Society moves as a unit made up of multitudes of smaller units.

If this is so, then there is no necessity of everyone seeing or thinking the same thing. We are then like an army where if all were armed men there would be no food, and if all were in the commissary department there would be no fighting. It is necessary that the Social eye see, and the Social hand work, and the Social mind think—all of these activities being reactive upon every individual comprising Society, for no one can think without sooner or later the dullest mind feeling the impact or the benefit of that thought, and no one can work without that act too permeating the whole social structure. Division of labor is not artificial but natural and apparently lawful in the sense of being full of the sanction of natural law

To be more explicit: some men see great dangers threatening society. They are able to see these things. But too often they break their hearts by the failure of others to see the dangers too But what if the others cannot see? It is not necessary that everyone should see, but it is very necessary that the seers should see If the seeing part of the Social mind sees, that is enough. The danger is seen Those whose social duty it is to see will take care of that. The strain and the fret and the needless sense of defeat comes when the futile effort is made to make those see who cannot, and whose seeing would not be beneficial to society in any event

RADICALS and Conservatives, who are markedly such, constitute small portions of the nation and check each other. They are, as it were, the advance guard and the rear guard of progress. Radicalism is wrong when it is jealous and Conservatism is wrong when it is greedy. No one will say that to challenge the injustices of the present system is wrong, and no one will say that to defend established injustice because it is established is right. Society itself is neither Conservative nor Radical—it just grows along, with enough of radicalism to keep it going and enough of conservatism to prevent it from becoming a monstrosity. If these two parties could realize their relative smallness and study their social functions, they would see that progress does not depend on converting the world to either point of view.

Then there are the liberal and conservative elements of society, better known in our country perhaps as Radicals and Hundred Per Cent Americans. There is a great deal of apparent difference between them, but only when considered as individual persons As social groups they do not much differ. There is in the social body the radical group and the conservative group, the latter holding things together and retaining all gains, the former kicking off in all directions, sometimes dangerously These groups have always existed in society Each has its function. In one age their field is education, in another art, in another religion, in another economics. And the worst of it is that the two groups so infrequently understand one another.

Yet every man is both radical and conservative, if he is alive. But he is usually grouped with one set or the other. If his tendencies are more radical than conservative, he is grouped with the radicals, and vice versa Simon-pure radicals and simon-pure conservatives do not exist, except where evil motives reign The hardest of the radicals and the hardest of the conservatives are likely to be moved by devilish motives. Honest men move between, susceptible to the truth as it touches them from either side

Now, it is undoubtedly in the order of things that these two groups should exist in the social body and that they should check each other. There is such a thing as being too progressive for healthy rootage, and there is such a thing as being too conservative for normal expansion. Death could ensue from either fault Thus the two check each other Analogy for these tendencies and operations could be found in the glands and acids of the physical body. If we could see all the expansions of life we should probably see them on every plane acting according to the same general laws.

The fault of the radicals is that they believe the whole world must be made radical before any good can come of radicalism, and the fault of conservatism is that it thinks all the people must be made conservatives before conservatism is safe. Both fall into the old fallacy that everyone must be converted to one point of view, one formula of thought, before benefit can be derived What each has to learn is this: when the radical view is amply seen and amply set forth by those who natively belong to it, and when the conservative view is seen and set forth by the natively conservative, Society is served. Each has done his bit; each has fulfilled his nature; the urge, whatever it is, that differentiates them has been satisfied.

With the conservatives warning us against the radicals, and the radicals showing the utmost contempt for the conservatives, the large active body of society is kept amply informed concerning both People who abuse each other usually tell the truth on both sides. The comfortable knowledge soon dawns upon the general mind that the conservatives are not strong enough to hold progress back and that the radicals are not strong enough to dynamite the solid gains of society.

It is a penalty one pays for a profound conviction or for a passionate devotion to any cause that he cannot detach himself long enough to view his position judicially. The fanatic has his compensations and his uses, but one of them is not judicial mindedness. Most fanatics are right, but they are forecasts of coming things, they are not today's leaders.

No one will pretend that the United States would be better off if hidebound conservatism had its way The men who represent the God of Things As They Are, the men who want the present system conserved because they happen to be the beneficiaries of it, the men who say this is the best possible of social systems because they are sitting on top of it, the men who pay for propaganda against progress and who hush up all questions, all criticisms, all stirrings of thought—these are not the men to whom we would willingly trust the future. They don't even know what the larger question is. They only vaguely feel that somehow their special graft is threatened.

Nor will any one pretend that the United States would be safe in the hands of those who because they have failed desire to dynamite the whole system out of existence These hold their conventions, and paraphrase society's soundest ideals, and talk big things about revolution, and spurn all that their fathers have gained—but they are mostly young, many of them have never known what work means, they live in a cloudland of theory, they have never come at grips with the reality of life that lies behind social conventions, as they call them, and, if they were given tomorrow the world they say they desire, they couldn't run it.

Still these latter are right. No one can deny the right they have to challenge things as they are And no one can deny the right of the conservatives to challenge the efficacy of the methods by which it is proposed to make things as they ought to be.

By one party we are reminded that we must march on, keep living, keep growing, always questioning our own handiwork. By the other party we are reminded that there are certain valuable possessions already in hand which should not be jeopardized for shadowy dreams

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

New York Shocked by Flood of Obnoxious Books

Writers and Publishers Swamp Country With Impure Literature

By CHARLES ALBERT COLLMAN

NEW YORK CITY has been startled by a flood of obnoxious literature—a deliberate attempt to introduce the morbid mentality of decadent races and depraved periods of history. Nothing quite so mischievous was ever adventured before, and from the source centers in the metropolis, this moral poison is being shipped out to permeate the country. Four books in particular, all of them of foreign origin, got out by supposedly reputable firms, indorsed by reviewers, were published craftily in such a manner that they would be introduced unthinkingly into decent homes. These volumes were —and are today—displayed in windows of bookshops and rented out by circulating libraries.

An organization founded and supported by the leading families in the city, the New York Society for the Suppression of Vice, attempted the prosecution of the publishers and dealers, and the opposition which met its efforts has proved the dangerous and insidious nature of this movement—its motives and the origin from which it has sprung. Two city magistrates, before whom the cases were taken, actually indorsed the books. Subsequent action by higher authorities, however, has resulted in one indictment, and the promised elimination of another work, a literal translation from the period of Nero, styled "the worst book in the world."

Incensed because a circulating library had placed a copy of one of these books in the hands of his daughter, Supreme Court Justice John Ford threatened to seek the prosecution of the persons responsible for its circulation. When he learned that this particular work had already been under fire, and that a city magistrate had exonerated the publishers, he exclaimed:

Judge Calls It Loathsome

"WHAT can ail our magistrates? This book is terrible. It is loathsome. A circulating library recommended this thing to my daughter. She turned it over to her mother, who was horrified, and she put it into my hands. It is a disgrace to the community if we cannot protect ourselves against such literature. I had no idea that anything of the kind was tolerated.

"This matter of bad books is an evil which has been forced on us by greedy book publishers, book sellers and circulating libraries. Nearly all of them seem to be featuring the most vicious works they can find. In the course of a walk of but a few blocks, I found three small bookstores each advertising the vilest of these vicious productions, offering them to boys and girls to read at twenty-five cents a volume. This commercialism of moral poison has taken place so brazenly that thousands of fathers and mothers are up in arms about it."

The Rev. Anson P. Atterbury, president of the Society for the Prevention of Vice, commented on the situation in these words:

"The ebb-tide of moral laxity, as a result of the great war, has revealed itself ominously in the social sphere in which we operate. Besides other manifestations, a group of magazine and book writers and publishers has made organized and persistent efforts to exploit the field of impure literature for financial gain, regardless of legal restrictions and of the debasing effect on society. The idea of freedom has been carried into license. How far this will go we cannot foresee: it is for us to combat this evil influence as far as possible."

Prominent New York newspapers, by reason of ownership and the influences exerted upon them, which are by this time pretty well understood, have become the partisans of this indecency. The latest report of the society has this to say about them:

"When, in the process of law enforcement, we interfere with the profitable business of some 'writer, publisher or bookseller, the customary course of these people is to cry loudly and persistently that the society is going outside of the scope of its proper activities.

"There has been much of that outcry during the past year, particularly with regard to two productions wherein the publishers of certain books were the defendants. Unfortunately, the average newspaper, as a part of the publishing fraternity, seems to regard it as a duty to uphold the publisher in all such cases regardless of the merits of the prosecution or the filthy character of the publication involved.

"The press makes itself the instrument and the blind tool of a small group swayed entirely by commercialism and gives that group aid and comfort at the expense of the public welfare.

"It powerfully assists this mercenary element in their vicious efforts to make it appear that the enforcement of law, when applied to them, is a crime against literature and art and a usurpation of an authority never intended, though plainly set forth, in statutory law.

"By epithet and misleading statements they seek to arouse public antipathy to the society and its activities. Another common charge is that the society, by prosecuting the author or publisher of a salacious volume, thereby advertises it and causes an increase in its circulation. The society prosecutes the publisher of a book in exactly the same manner in which it prosecutes the manufacturer of an obscene photograph. If by its action it advertised one, it would similarly advertise the other. In the past four years, the society has prosecuted hundreds of cases, only fourteen of which involved book publications. The public heard of the fourteen cases because the press smelled out what they call 'news value.' On the other hand, the public heard nothing of the hundreds of other cases because there was no 'news value.' In other words, the newspaper is the agency which advertises the obscene book when it is brought into court. When the ethics of newspaper publication make the broadcasting of such a subject taboo, the public will reap the benefit.

"Of course it would be very nice and profitable for the gentlemen who engage in questionable publishing enterprises if by those fallacious charges the society could be induced to close its eyes to infractions of law in cases where the offender has access to means of publicity, rallying to his defense. *But it is the belief of your board of managers that the law applies no less to the publisher of the two-dollar book than to the peddler of the two-cent post card.* On that theory are they prepared to carry on this work and on no other.

"The trouble is that there is too much clannishness in the various branches of the book publishing and distributing trades. It is this spirit of clannishness, apparently peculiar to the United States, which causes the malodorous activities of a few to be visited upon the whole group. When no voice from within the group, with a few notable and honorable examples, is raised against the excesses of the few, the public gains the impression that the whole group is diseased and, as a consequence, when public exasperation germinates into action, the action is against the group, just as in the case of the motion picture producers, who are now the subjects of official regulation.

"One book which was published and was being loaned out indiscriminately at fifty cents purported to be the diary of a foreign school girl between the ages of eleven and fifteen years. It reported in detail the alleged activities and gossip of a group of young girls. The magistrate who reviewed this book stated that in his opinion it 'is a distinct contribution to the literature of the present day.'

"The other magistrate had before him an up-to-date slangy translation of an ancient product of decadent Rome. It is admittedly lewd and obscene in material portions, but the learned magistrate says:

" 'Its value to the student and scholar is such that it would be too serious a matter to deny access to it, for ancient literature enlarges and enriches the mind.'

"He seems to forget that every library of importance contains volumes which are not permissible in general circulation and yet may have some historic and sociological value, but which are kept under lock and key for the instruction of legitimate students. This is a very different matter from the indiscriminate sale in a form understandable by the very youthful and those who lack the mental poise to read filth without contamination."

Mr. John S. Sumner, executive secretary of the Society for the Suppression of Vice, outlined to me some of the difficulties attending efforts toward preventing the circulation of vicious publications in New York. "We very well know," said Mr. Sumner, "from a half-century of experience, that the law which we are required to seek to enforce here is a 'wholesome law' and sufficient in its terms. If, for any reason, the magistrates before whom such complaints must be brought fail properly to construe and apply the law, but, on the contrary, by their decisions, condemn the public to countenance and to receive all the literary garbage of ancient and modern Europe and some domestic decadence, what is the remedy?

Boston Dealers Different

"THERE is no need to doubt that there is one in sight. For instance, Boston has forty-odd booksellers—old, established firms that take a pride in their business. They have organized a volunteer booksellers' committee, which promptly takes up for consideration any publications complained of. The committee examines such books, passes upon their status, and decides whether they shall be sold or not. Their decision is recognized by the bulk of the booksellers throughout the state of Massachusetts. The influence of this organization has spread into Rhode Island, and the booksellers of that state have adopted a similar plan. The Philadelphia booksellers have adopted resolutions condemning the tone of a great deal of modern fiction, and have carried this question to the National Booksellers' Convention, which had quite a discussion on this subject on the floor.

"Then there are publishers who bring out alleged limited editions of pernicious books for what they call 'private circulation.' In such instances they merely establish a precedent which justifies them in insinuating such works into general circulation, perhaps through the medium of the many so-called circulating libraries and the like. Sometimes such books are sent through the mail at ten dollars a volume.

"One of these publishers brought out the copy of an obscene book entitled 'The Satyricon of Petronius Arbiter.' In Europe a translation of this work has found some circulation, but there the more objectionable passages were eliminated. In the edition brought out by these New York publishers, all the filthy stuff was translated plainly in the slangy phrases of the present day. One of our agents went to the offices of this publisher and asked for a copy of the work about which complaints had been made. An employe stated that the books had been sold on subscription, and the supply was exhausted, but that he could obtain a set for thirty dollars. He finally agreed to sell a copy for twenty dollars later in the day, and did so.

"The magistrate before whom this case was brought dismissed the summonses and discharged the defendants. A complaint was then laid before the district attorney, and it is my understanding that the publisher has agreed to withdraw the book from circulation and recall those copies already sold.

"Three other books that have caused a great deal of indignant comment are written in an insidious style, the objectionable matter presented in high-flown language, but its purport easily understandable by any youngster seventeen or eighteen years old. These works are all of foreign origin. The New York publisher was brought into court, and when he was whitewashed by a magistrate, he utilized the comments that had been made upon his publications as publicity for the more extended sale of his books.

"Through our efforts, the matter was brought to the attention of the district attorney, and the books were laid before a grand jury for their perusal by its twenty-three members. That the ordinary citizen is the best judge of such works is the test the courts impose, and the grand jury at once found an indictment against the publisher. The case will now be tried by a trial jury of twelve men. The obnoxious books, in the meantime, are being widely circulated throughout the city and country.

"In the older countries of Europe, where the publication of such books is permitted, parents have grown accustomed to keep guard over the kind of literature perused by their young folk. With us it is different, and young people are tempted by circulating libraries to become familiar with writings that are dangerous to those of their immature years. We are too young a nation to have such literature thrust upon us.

"Unfortunately, there is a growing number of writers in this country who are tending toward the production of pernicious books. They are of the type of whom Irving Bacheller recently wrote: 'The sellers of sex passion done up in glittering phrases, the purveyors of the psychology of seduction and utter recklessness, are making books and reputations doomed to go to the garbage heap. So much of this vaunted modern fiction offers a pathway of muck covered with tinted and perfumed sand. One cannot go far upon it with clean feet. It is mostly published by men of the European spirit. The decent thing pays better.'

Indictments Returned

"TWO such works, widely advertised, were the subject of prosecution and conviction in Boston through the activity of the New England Watch and Ward Society and its sane and public-spirited support by the judiciary of that jurisdiction. The author of one of these same books is a defendant in a federal case in Chicago, based on another publication and on evidence which we secured by mail and referred to the postal authorities. Indicted with him are his illustrator and two publishers."

Two of the books concerning which prosecutions were initiated in New York were products of Viennese writers. Arthur Schnitzler, the author of one of them, also wrote a play called "Reigen," of so indecent a character that riots attended its production in Berlin. Several months ago, the Green Room Club announced that it would produce "Reigen" at the Belasco Theater as a climax to a dinner given for Otto H. Kahn, the Wall Street banker. Mr. Sumner at once gave information to Police Inspector Bolan, in command of the Tenderloin District, of the nature of the play, and the inspector stated that he would take summary action against it if it was as represented.

The program of the Green Room Club came to nothing, Mr. Kahn announcing his decision not to attend the play.

In the office of the Society for the Prevention of Vice is kept a record showing the pedigree, as far as possible, of every person arrested on complaint of the society since its foundation in 1873. In its annual report, in a paragraph preceding a tabular statement, showing among other data, the nationality and religious creed of persons arrested, the society says:

"The following statistics should suggest to thoughtful persons a situation affecting the moral life of the nation, requiring the exercise of unusual wisdom in its treatment. The very large percentage of offenders of foreign origin, indicated in the latest records, is an argument supporting the demand for more stringent laws regulating the admission of immigrants to the United States, and their distribution in the interests of assimilation."

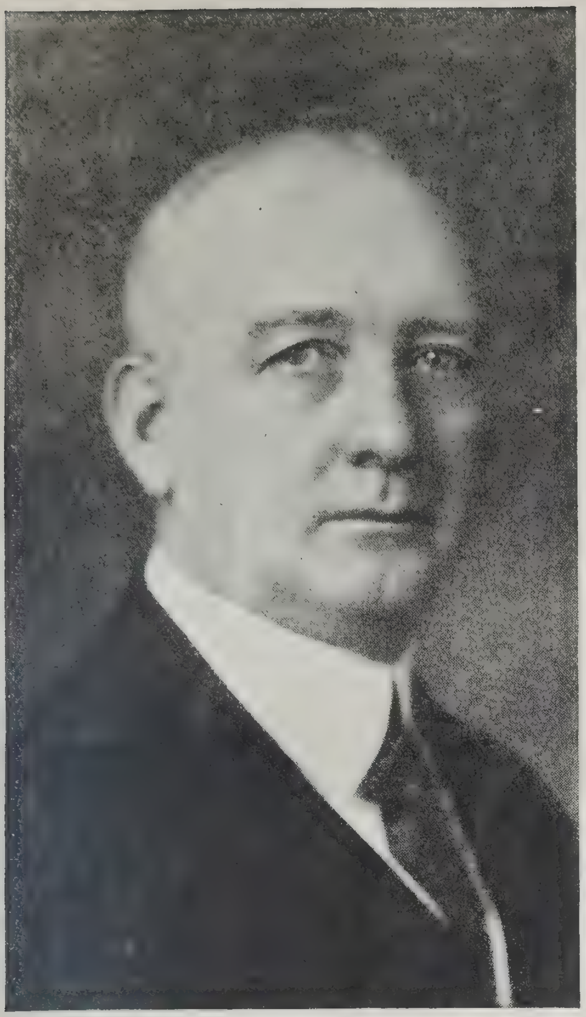
The figures given in the tables of the Vice Society, indicating the persons arrested by their nationality and creed, show that persons of the Jewish persuasion outnumber those of any other race. This is an unpleasant commentary on the tendency of a race numerically so inferior to the general population.

In connection, however, with the publication and circulation of indecent literature in New York, it must be noted that the works complained of, whether domestic products, or foreign importations, are for the greater part written by Jews. As before stated, Arthur Schnitzler, an Austrian, is author of one of these books, in addition to being the writer of the obnoxious play, "Reigen." Dr. Sigmund Freud, of Vienna, founder of his degraded Jewish cult, psychoanalysis, is the sponsor for another of these works, the one alluded to as having been written ostensibly by a young Austrian schoolgirl. The book is anonymous, but Dr. Freud, in a preface, stamps it with his approval. The publishers of the books against which action has been taken are Jewish firms. The persons summoned to the various courts, charged with responsibility for their circulation, were invariably Jews. And the small shopkeepers, who so boldly display these depraved writings in their windows, are Jewish for the greater part. Furthermore, the New York City magistrate who gave his official endorsement to the translation of the "Satyricon" is a Jew.

Constitution of the United States 136 Years Old

Present-day Confusion and Inefficiency Charged to Departure From Great Charter of Government

By J. V. NASH



H. F. ATWOOD,

President of Constitution Anniversary Association, author of "Back to the Republic," etc.

ON SEPTEMBER 17, 1923, the Constitution of the United States will have reached its 136th milestone, still hale and hearty, notwithstanding the many storms which it has weathered.

The seventeenth of September is the birthday of our Government, just as the Fourth of July is the birthday of our freedom. The day has been strangely neglected in the past. Within the last few months, however, a Constitution Anniversary Association has been organized, under the presidency of Harry F. Atwood, of Chicago, to promote all over the country, in the schoolrooms and through the columns of the press, a fitting observance of the day. The association hopes thus to kindle an interest in the Constitution which will lead to a wider understanding of the principles for which it stands.

When the Federal Constitution was signed, a new epoch in political history began. The men who framed the Constitution were working for generations yet unborn, although doubtless few if any realized at the time the epoch-making nature of their labors. They had no models to guide them in the framing of the Constitution. It was a bold experiment, a great adventure into the unknown in government.

Many predicted failure for the experiment, and the wonder is not that sixteen of the fifty-five delegates assembled in Independence Hall at Philadelphia passed up the opportunity to immortalize their names by affixing their signatures to the Constitution, but rather that as many as thirty-nine—a majority of more than two-thirds—possessed the faith and the vision to offer themselves as sponsors for a new plan of government, the success of which could be determined only by time.

Although it was with doubt and misgiving that the new Constitution was adopted by the states, three years elapsing before the entire thirteen had registered their ratifications, its far-reaching significance quickly impressed some of the keenest minds of the age. George Washington, only two years after the signing of the Constitution, remarked: "I can almost see the divine hand of Providence during those days when the Constitutional Convention was assembled, and we had all reason to fear that misery, confusion and darkness were coming upon us."

What Pitt Thought of It

IT IS said that William Pitt, who was Prime Minister of England at twenty-four, after reading a copy of the American Constitution which had just reached England, exclaimed, upon laying it down: "It will be the wonder and admiration of all future generations and the model of all future constitutions." And he was right. It has been indeed the wonder and admiration of succeeding generations, and it has been the model of the constitutions of all the other republics of the New World.

Another great English Prime Minister, William E. Gladstone, a century later, in cabling his reply to an invitation to be present at the centennial of the Constitution, added to his respectful regrets these impressive words: "So far as I can see, it is the greatest piece of work ever struck off at a given time by the brain and purpose of man."

To the untiring labors and political genius of Washington, Hamilton and Madison, above all others, we are indebted for the form of government conceived in the Constitution. These men were all Federalists, believers in a strong national government. Jefferson, the greatest of the anti-Federalists, was serving his country abroad at the time the Constitutional Convention was sitting. To Jefferson, however, the credit is largely due for the great "Bill of Rights," guaranteeing freedom of speech and of the press, liberty of conscience, and the right of peaceable assembly for the redress of grievances, which, in the form of the first ten amendments, was proposed shortly after Jefferson's return to America in 1789 and was forthwith added to the body of the Constitution.

The force and power of the Constitution, as adopted by the young republic, lay to a great extent in its elemental simplicity. Its text consists of but seven articles, two of which are of one short paragraph each. In the reference book lying before me as I write, the body of the Constitution occupies but two full pages of type.

The whole spirit of the Constitution, its scope and purposes, is perfectly summed up in that brief but majestic Preamble, which should be committed to memory by every boy and girl in our public schools:

> "We, the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution of the United States of America."

The deliberations of the convention which brought forth the Federal Constitution covered a period of only eighty-five working days. Yet the work which was produced in those eighty-five days remains after 136 years the cornerstone of a nation which has grown to be the greatest free commonwealth on earth. The men of the Constitutional Convention worked under conditions which the modern legislator can hardly visualize. Unknown to that day were the innumerable time and labor-saving contrivances of our age, telephones, telegraph wires, radios, typewriters, railroads, automobiles, elevators, and the like. They were not supplied even with clerical help, to say nothing of such modern luxuries as expert stenographers. All provisional drafts, reports, resolutions, correspondence, and other data were written out with pen and ink by the greatest men of their day—by George Washington, the president of the convention; Alexander Hamilton, James Madison, Robert Morris, Roger Sherman, and the venerable philosopher-statesman, Benjamin Franklin, bowed down with the weight of more than eighty years.

Some State Performances

IT WOULD be well for many of our modern legislators engaged in drawing up new state constitutions, to take a leaf from the notebook of the Constitutional Convention of 1787. In recent years there has been an epidemic of new constitution-making in different states. Constitutional conventions have met, old constitutions have been scrapped, and innumerable small-caliber delegates have orated and resoluted and reported and wrangled and submitted all sorts of absurd and inane suggestions for incorporation in the new constitution.

After months and sometimes years of contention and bickering and waste motion—all at the expense of the taxpayers—a huge paper crazy-quilt dubbed a "constitution" has been thrust upon the people of the state. In some of our western states these new "constitutions" reach the proportions of thick volumes, containing a jumble of the most absurdly incongruous material, much of it consisting of petty regulations and by-laws for state institutions, which have no rightful place in a constitution. If a state insane asylum cannot be administered without the aid of the constitution, the mental level of those in charge cannot be much higher than that of the inmates.

In the state of Illinois a constitutional convention has been in session for more than two years and a half, for the purpose of submitting a new constitution to the people of the state, which has already had three different constitutions since its admission to the Union. Month after month passed by, marked by endless conferences, reports, tentative drafts, and adjournments. A number of the delegates died before a final draft was agreed upon a few weeks ago, and one may indeed fear that the new constitution, if it is finally adopted by the state, will prove but another in the long series of monstrosities which have been saddled upon our states in the recent past, and that in the course of a few years it in its turn will be discarded, and the tedious, futile, and expensive process of new constitution-making repeated, *ad infinitum, ad absurdum,* and *ad nauseam.*

The Federal Constitution should serve as the model for all our state constitutions. As has been so ably pointed out by Mr. H. F. Atwood, who by voice and pen is doing an invaluable work in spreading a knowledge of the true meaning of the Constitution, the founders of the republic established the golden mean in government, as between mobocracy on the one hand and autocracy on the other. The Constitution created, for the first time in history, a real republic, functioning through representative government. The four great pillars supporting the superstructure are the executive, the legislative and the judicial departments, and individual rights.

During the one hundred years following the adoption of the Constitution, when its spirit was loyally adhered to, the United States enjoyed a progress and prosperity unexampled elsewhere in the world.

Unfortunately, during the past quarter of a century the country has been drifting in a dangerous manner from the safe anchorage of the Constitution. The result has been that both autocracy and mobocracy have been displacing constitutional liberty, and there has been a growing tide of discontent, class consciousness, and demand for special privilege.

A deluge of laws pours out on the country year after year. During the five-year period from 1909 to 1913 inclusive, there were enacted more than 62,000 new laws, and in that same five-year period more than 65,000 decisions were handed down by our higher courts, a mass of legal "precedents" filling 631 large volumes! It would take more than a human lifetime to read a single year's crop of new laws and legal decisions. Consequently, they are disregarded, and all law comes more and more into contempt.

Perhaps the most dangerous manifestation of our departure from the Constitution has been the mushroom growth of official boards and commissions unauthorized by and unknown to the Constitution. It is related that just before Lincoln started for Ford's Theater, on the last night of his life, he was visited at the White House by Mr. Ashmun, who had been the presiding officer of the Chicago Convention in 1860 which nominated Lincoln for the Presidency. "Mr. Lincoln," said Ashmun, in the course of their chat, "I am interested in a cotton claim, and I want you to appoint a commission to investigate the matter and report." Lincoln replied, with an abruptness and impatience for which he immediately afterward apologized to his visitor: *"Ashmun, I have done with commissions. I think they are contrivances to cheat the government."* These were Lincoln's last recorded words on the subject of government.

One can imagine what Lincoln would say were he to come back to life today and witness the extent to which the people of this country are being tyrannized over and eaten out of substance by boards and commissions existing without the slightest Constitutional authority.

A year or two ago it was estimated that there were at that time, "sitting pretty" in Washington, SEVENTY-SEVEN BOARDS AND COMMISSIONS WITH 90,000 SALARIED RETAINERS ON THEIR PAYROLLS.

These boards and commissions are in many cases, it would seem, mischievously interfering with business. A well-known speaker, addressing a meeting of business men in Chicago not long ago, declared that one of the important factors responsible for the high freight rates now being charged by the railroads is the cost to the companies of the great number and variety of official reports which they are compelled to compile, necessitating the employment of large staffs of statisticians and clerical assistants.

Usurping Government

IN SOME of our states, government by these autocratic boards and commissions has reached the point where it is nearly usurping representative government. One state is reported to have 128 boards and commissions in operation. Meanwhile, the expenses of government in nearly every state have been doubling every few years, and in addition to the Federal income tax the long-suffering public is being forced to "come across" with a state income tax, in addition to the property tax. The income tax is one of the most important provisions, already adopted, for the new Illinois constitution.

As Mr. Atwood remarks in "Back to the Republic":

> "It was never contemplated by the men who wrote the Constitution and founded this Republic, that individuals, boards and commissions should be called in hastily and promiscuously, from the outside, and assigned dictatorial and autocratic power on momentous undertakings. Such a course usurps the proper jurisdiction of regularly appointed heads of cabinet departments and regularly elected members of the legislative body."

We have heard a great deal in the past two or three years about "getting back to normalcy." If the government could be made to get back to the Constitution, we would then find ourselves on the rails again and in a position to continue our interrupted journey to prosperity. We are not likely to make much progress by bumping back and forth on the ties in a vain endeavor to reach "normalcy."

On this 136th anniversary of the Constitution, let us proclaim anew our allegiance to the principles on which the nation was founded—a republic, of the people, for the people, by the people, functioning through representative government.

History of the Pueblos Told in Photographs

No Greater Wealth of Art Material Than That Found in Land of Indians

BY HAROLD D. CAREW

HALFWAY across that far reach of country which extends southwesterly from the mountains of Colorado to the coast of Southern California is America's Egypt-like region, the land of the Pueblo Indian. Thirty years ago little was known of the people who lived there, save for the strange stories told by wandering prospectors and pioneers. Weird tales from the days of the covered wagons had cast a spell about the land whose mystery remains much the same as it was in the days before the railroad builders had pushed the white man's habitat westward over the cacti plains and the sage-clad mesas into the communal villages of adobe huts that dotted the sun-dried landscape of the far Southwest.

Twenty years ago, when Carl Moon, then a successful portrait photographer in a mid-western city, turned the key in the door of his establishment and set out upon a journey across the plains and into the heart of this little-known territory, the artist within him that yearned for expression found a region whose mode of aboriginal life he was destined to transfer to imperishable plate and canvas. The years of his sojourn among these new-old Indian tribes produced a collection of many hundreds of negatives from which were selected more than three hundred photographic studies which Henry E. Huntington, multi-millionaire railroad magnate and art collector, recently purchased for his beautiful new $500,000 library and art gallery on his estate at San Marino, California.
